usual gear A is free on its and a nut B is d hard on to d of the spindle, to keep the in position. The er C is driven ojections A1 on gear wheel A h the medium portions C1 in- with C. The member C is longitudinally displacable tension of nut B, and by means of pegs B2 sliding in d grooves B3 may alter its position relatively to B e armature-shaft, thereby advancing or retarding the n point to any required degree.

order to ensure a sound job, a pin passes through nut l the armature-shaft, while the projections A1 are a working fit in holes in C1. A suitable lever arrange- is employed to actuate the slidable collar C, the exact ition depending on the machine to which it is fitted. levice has the advantage that it may be fitted to any g machine.

WM. A. DAVIS.

Exchange Transactions.

71.]—Noticing a certain amount of correspondence in paper anent the bad business methods, to use the offensive term, employed by some of the dealers in l-hand motor cycles, I think perhaps my experience in lar transaction may be of interest, if not of actual value, ne of your readers.

e little time since I sent an old machine to Messrs. nope's, asking them what they were prepared to allow in part payment for a second-hand machine of later and in reply they stated £6 could be allowed in part nt for a second-hand machine, and £11 10s. in part nge for a new machine of the previous year's pattern g, new, £32. I desired a spring frame Bat, so accepted fer of £6, and was prepared to wait until the machine ted turned up, but in the meantime kept my eyes open good machine of any other make which might suit. Messrs. Wauchope's from time to time wrote giving specifications of machines they thought would suit, and advising what they thought would be fairly certain to give satisfaction in this district (South Wales). Upon one occasion I sent a cheque to them for the purchase of a 3½ h.p. Bat, but the machine had just previously been sold, and my cheque was returned. I have not been suited yet, but this has not been through lack of courtesy and honest endeavour to please on the part of the persons with whom I have been dealing.

I think perhaps there are some who in purchasing a machine expect to receive a new mount at a second-hand price, and are greatly astonished that a dealer should wish to make a profit, probably thinking he should carry on his business as a philanthropic institution; but, of course, there are dealers who take an unfair advantage of the beginner. May I suggest that all persons, after dealing with a dealer in second-hand motor cycles, should write to the editor a short report of his treatment, such statement being filed and used for the benefit of beginners who write to the editor seeking his assistance. If this suggestion is acted upon, I should advise that every beginner write to this paper giving a list of the firms who he thinks will suit him, and requesting the editor's advice as to the one with whom he should do business.

The harm done to motor cycling by the unscrupulous dealer cannot be taken too seriously; there is also a great deal of annoyance caused by the firms who do not take the trouble to suit their customers. Where is the man, given the machine for which he has paid a reasonable price (and of which he knows very little), which turns out to be of bad make, in wretched condition, and requiring a great deal more tuning up than the owner is able to give it, who would not be considerably discouraged and tempted to give up the pastime altogether? Undoubtedly a great number of persons have been lost to the motor cycling ranks after their first attempt on this account. The praise or condemnation of a person who has tried motor cycling has more effect than the words of one who has not.

SOLICITOR.

The Future of Motor Cycling.

[3172.]—I have just finished reading the paper on "The Future of Motor Cycling," and notice that mention is made therein of the Mabon clutch.

As I have been a most satisfied user of this excellent accessory, I think it only fair to the makers thereof to give expression of my satisfaction.

The clutch has been fitted to my machine—a 3½ h.p. Vindec—for about a year and has seen a large amount of heavy traffic work, and for such riding its value is inestimable. I simply would not on any account go back to the fixed pulley arrangement. I have discarded the pedals as being unnecessary now, and seldom feel the need of them.

Although a starting handle is provided with the clutch, I do not use it. I merely start the engine by running alongside the machine, take the clutch out, stop the machine, and sit across the stationary machine in safety and comfort, the engine being governed by the exhaust valve lifter. I have nothing but praise for the clutch.

T. H. D., B.SC.

[3173.]—Mr. H. G. Bell's lecture on the above topic, before the members of the Auto Cycle Union, on the 28th ult., brought out a somewhat lengthy discussion of a more or less mutual admiration order.

The importance of the subject merits discussion on much broader lines, and I trust you will open your columns for a further ventilation of your readers' opinions.

Without wishing to discount the value of the trade member's experience, the writer values the practical rider's views as tending towards a more rapid and healthy growth of the sport, as well as an appreciation of the vast utility which the motor bicycle opens up.

Has not a clerical gentleman advanced the state of the two-speed gear in spite of trade opposition at first? Would motor bicycles for the fair sex have been attempted at all had it not been for an enthusiast in the Midlands who, by practical example and a facile pen, "bossed the job" of designing something approaching what is wanted but as yet not attained? It is a thousand pities that Englishmen with the most superb system of roads at their doors do not wake up and supply a lightweight, medium powered, variable speed, easily started, comfortable and clean motor bicycle, which would tempt the thousands of cyclists to swell our ranks and help to influence beneficial legislation to further aid our cause.

Mr. Bell showed us French, Swiss, and Belgian examples of light motor bicycles, the clean splendid workmanship of which showed itself in even the most minute details. Are there no English specimens that can match the Continental machines, and why not? The writer has owned and ridden five motor cycles ranging in weight from 79 to 200 lbs., with three h.p.'s from 1½ to 4, and he proposes now to return to the first love—the lightweight—for obvious reasons.

One speaker wandered away to tricars, and might possibly have ended up with Quads, forgetting that his firm's design of a motor bicycle is one of the most original and practical machines made in England—at least that is the writer's opinion, who might possibly be riding one had not its weight and price been a drawback to his enthusiasm.

A machine on the lines of the Phœnix Cob, built up of light gauge tubing, with extra braces similar to those used in the Dursley-Pedersen push bicycle frame, a vibrationless engine of the double-opposed cylinder variety, with chain drive enclosed in an oil case cover, might sell, if the price was not over £32, and well made.

The first time the writer saw a Motosacoche it was being driven along the footpath leading into Milan, Italy. Rain descending in torrents caused the wide deep gutters to fill to quite a large stream, while trees planted in the middle of the pathway obstructed the course. In spite of all this the rider's speed was, to say the least, rather fast, and, to my mind, dangerous under the circumstances, which speaks well for the easy control of this machine. Good business management and judicious advertising, together with splendid workmanship, tell in the end. Personally, I do not care to own one of these machines, because the engine is too high up in the frame, and I should prefer the ladies' model, where the engine is of more generous dimensions, but I believe in a two-cycle or else a double-opposed engine type as being free from vibrations, which tend to weaken a light frame.

Motor cycles that permit the rider to place both feet squarely on the ground are safest in grease, and disastrous sideslips may be avoided when one is able to check the first symptoms by a vigorous kick on the ground. The Fairy and Douglas are too high up, and the Fairy has a countershaft running at nearly engine speed. If the light Fairy were built more on the lines of the higher powered machine of the same make it might possibly sell better. The Americans can build a twin-cylinder 5 h.p. motor cycle only weighing 135 lbs. (see page 230, January Number *Cycle and Automobile Trade Journal*), then it is time that we had a 2½ h.p. weighing less than 90 lbs. on the fine roads in this country.

Cannot levers be made to take the place of cranks for the pedals, so that footboards may be used without interfering one with the other. The gear ratio may be changed by attaching the chain at different parts of the lever, and the length of stroke adjusted to suit the length of reach and height of frame. This letter is already too long, otherwise the writer might illustrate his meaning with a few sketches showing the possibilities of his ideal mount.

INTERNATIONAL.

First Motor Cycle Race at Brooklands.

[3174.]—I was greatly surprised to see in the last issue of *The Motor Cycle* the prominence given, not only in the editorial columns, but in the advertisement of one of our most esteemed competitors, to what was evidently intended to be a friendly match between two Oxford men. And, under the circumstances I feel that it is only fair to riders of Vindec Special motor cycles to explain a few facts in connection with this event.

In the first place, the Vindec Special ridden by one of the competitors was purchased by him in December, 1906, and has probably been ridden many thousands of miles, not only by the owner, but by various friends of his in Oxford. The machine when sold (and we understand it was ridden at Brooklands in the same condition) was fully equipped as a roadster according to the A.C.U. definition of a touring machine, and was what the manufacturers designate as their Tourist Trophy model. According to *The Motor Cycle*, the Triumph machine was stripped of mudguards, but *The Motor Cycle* does not mention the fact that it had auxiliary ports in the cylinder, which was a fact. It, therefore, became without question a track racing machine, and the time made has been equalled on Canning Town track many times by much lower powered machines; therefore, it was nothing marvellous.

The rider of the Vindec, unfortunately, drilled some extra air vents in his induction pipe just previous to the race, and some of the borings got lodged under one of the exhau valves, causing one cylinder to stop firing. It is, therefo nothing to the discredit of the machine that he was beaten.

The manufacturers of the Vindec Special have never cater for track racing, and confine their efforts entirely to ful equipped touring machines. If, however, the Triumph C believe that their machine is faster than the Tourist Trop Vindec Special, I am quite willing to arrange a friend match race at Brooklands, I to ride the 75 × 76 Twin Tour Trophy model Vindec against an 84 × 86 single-cylind Triumph driven by a member of their staff, the conditio being that no auxiliary ports are to be drilled in either cyli ders, and that each machine will be so equipped as to comp fully with the Tourist Trophy conditions of 1907, the mat to consist of flying start races over a measured mile, the b two out of three to be the winner and the loser to pay Broo lands track expenses.

W. H. WELLS

Courtesy at the Shows.

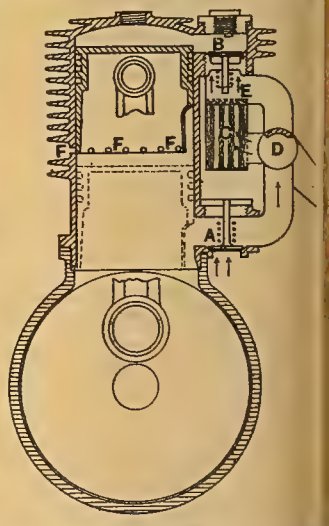
[3175.] — In reference to the letter signed "Cr Quartette," may I be allowed to state that within my o experience courtesy is not yet altogether dead in Engl firms. I refer to the Lloyd Co., Birmingham. Last Decem they allowed me a trial run on their 3½ h.p. machine. T weather was bad and the roads in a terrible state. Howev they made no conditions at all as to the state in which machine might be returned. I was also shown over th works, and had every detail fully explained.

I am in no way connected with the trade. However, I h that the gentlemen in question, although they may "cross," have not been "caught yet" by the foreign tra

C. CALDICOTT

Two-stroke Engines.

[3176.]—Seeing a design for a two-stroke engine in a rec number, it occurred to me that one of my own might be interest, as I think it could be more easily fitted to a motor cycle frame than the one in question. On the upstroke of the piston air is drawn in through valve A.



The down stroke compresses this air and drives it through the wick carburetter C to valve B, which prevents the mixture entering the cylinder, until the pressure of burnt gas has fallen considerably, thus lessening the risk of preignition. The mixture is adjusted by the three-way tap D, and the exhaust gases escape through holes F. The crankcase could be designed with a very small capacity, so that a fairly high pressure of air could obtained below the piston. I suggest that throttling co be obtained by opening a small tap in the air pipe below some of the air would be expelled through this, and, co quently, less mixture would reach the cylinder. An ordi float chamber—not shown—would maintain a constant l in chamber C, and a very small hole would connect then that the level would not be appreciably altered by the m ments of the piston.

E. SHIRLEY JONES

EXPERIENCES WANTED.

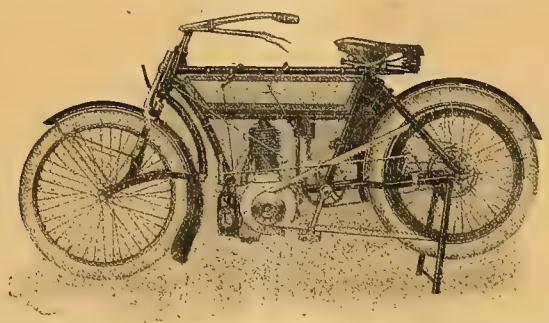
"C.C.P.L." (Melksham) would like users' experiences of two-speed gear manufactured by T. Slaughter, of Weston-su Mare. The gear was illustrated and described in *The M Cycle* of August 7th, 1907.

"Albany" would value riders' experiences of the Triumph used with a sidecar attachment. What is maximum gradient machine will take without two ge passengers about 20 stones? Also opinions of users of new Montgomery sidecar. Does the non-skid attachn really prevent side-slip?

VINDEC · SPECIAL

THE · MOTOR · CYCLE · OF · MERIT.

S.B.T. Co LTD



Model H, single cylinder, 3½ h.p., with "Vindec" Two-speed Gear, makes an ideal combination for the discriminating buyer who wants solid comfort combined with absolute reliability. It will take you anywhere—can be started without the least difficulty in the middle of a steep hill—and is a worthy companion to the twin-cylinder "Vindec," which is acknowledged to be one of the best motor cycles in existence.

Our profusely illustrated "Book of the Vindec Special" is interesting reading—sent free upon receipt of request.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—1d. per word, minimum 1s. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, on the Friday morning, or if sent to London, by the Thursday afternoon previous to the date of publication.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at *The Motor Cycle* Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed "No. 000, c/o *The Motor Cycle*, Coventry," or if "London" is added to the address, then to the number given, c/o *The Motor Cycle*, 20, Tudor St., E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with *The Motor Cycle*, both parties are advised of this receipt, and upon intimation of the arrival and acceptance of the goods, the money is forwarded less a charge of 1s. for registration. The time allowed for a decision after receipt of the goods is three days. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR BICYCLES FOR SALE.

HALIFAX Motor Exchange. — As the largest dealers in Rex machines, we have a few 1907 shop-soiled machines at clearance prices. Great bargains. Exchanges in all 1908 Rex and N.S.U. models.

HALIFAX. — 1907 3½ h.p. Rex, 26 by 2½ Continentals, spring forks, soiled; 19 guineas, November price £26 5s.

HALIFAX. — 1907 35 guinea twin Rex, spring forks, soiled; £23; you save £13 15s.; we gain your confidence.

HALIFAX.—1907 magneto twin Rex, unridden, November price, £42, our price £28 10s.; another £13 10s. saved.

HALIFAX.—Shop-soiled 1907 black and gold Rex de Luxe, twin tyre, magneto, Roc clutch; 1908 price £55 13s., our price £35; you save £20 13s.; we cannot keep this up indefinitely, and only a Rex agent can do it.

HALIFAX. — 1908 Rex de Luxe, Roc clutch, two-speed gear, magneto; 55 guineas; liberal exchange.

HALIFAX. — 1908 Rex featherweight, magneto, magnificent hill-climber, recommended; 25 guineas.

HALIFAX.—1908 3½ h.p. N.S.U., magneto, just delivered; £40; allow £25 for last year's model.

HALIFAX.—1908 5½ h.p. twin N.S.U., magneto; £52; allow £25 for 1907 single magneto, in good condition.

HALIFAX Motor Exchange.—Extended payments, exchanges; high-class machines purchased for spot cash. — 16, Westgate, Halifax. Telephone, 766.

The FIRST TOUR of the SEASON!

Do you remember the splendid weather and grand roads of last Easter?

DO NOT BE UNPREPARED.

The PREMIER MOTOR AGENCY will take your old machine off your hands (allowing best possible price). This will save you all the annoyance and delay of selling it privately. They will advise you as to selection of a new machine suited to your individual requirements.

The following are good to select from:

TRIUMPH.
N.S.U.
VINDEC SPECIAL.
Rex.
ROC.
BROWN.
F.N., 4-cyl. and Lightweight.
MOTOSACOCHE.

They can be seen running here, or we will furnish all details.

But do not be too late to get Delivery.

SECOND-HAND MACHINES are being SNAPPED UP. Write for our full list of these; all tuned up and sold under signed Certificate of Fitness.

MOTOR BICYCLES FOR SALE.

HALIFAX.—Holds the finest and largest stock of second-hand cycles in the world. 300 to select from.

HALIFAX.—Fine twin Rex, Greenwood's Leeds-London record holder, registered, guaranteed; £22 10s.

HALIFAX.—1907 5½ h.p. twin N.S.U., spring forks, 2½ tyres, regular Beau Brunell, lovely machine; £27 10s.

HALIFAX.—5 h.p. twin Antoine, 1907 machine, spring forks, without fear or favour; £25.

HALIFAX.—6 h.p. twin Antoine, 1907 gine, spray, 26 wheels, nearly new; £14 10s.; splendid climber.

HALIFAX.—3½ h.p. Minerva, spray, girder forks, 26 by 2¼ Clincher A Won, begging at £16 10s.

HALIFAX.—4 h.p. 1907 Jap, 85 by 85, Chater-Lea, 24 by 2¼ tyres, almost equal to new; £23; torpedo tank.

HALIFAX.—3½ h.p. Phelon and Moore, magneto, spring forks, low frame, two-speed gear, climbs anything; £34.

HALIFAX.—3½ h.p. 1907 Rex, magneto, Crypto two-speed gear and Montgomery flexible sidecar; complete, £28 15s.; without sidecar, £24.

HALIFAX.—3½ h.p. light low Rex, spring forks, 26in. wheels, Longuemare; £12 17s. 6d.; snap this.

HALIFAX.—6 h.p. twin Rex, 26 by 2½ Clincher A Won, spring forks; £22; £17 allowed for powerful 1907 machine.

HALIFAX. — 1906 3½ h.p. Rex, specially good condition, 26 by 2¼ Clinchers; £16 5s.

HALIFAX. — 5½ h.p. 1907 Rex de Luxe, twin tyre, Roc clutch, magneto, spring forks; £27 10s.; nearly new.

HALIFAX.—2 h.p. Humber, spray, trembler, chain drive, splendid climber; cheap, £9 10s.

HALIFAX. — 1907 twin Minerva, spray, non-skid to rear, long low mount; £24 10s.

HALIFAX. — 3½ h.p. 1906 Rex, spring forks, low frame, foot brake, aluminium finish; £15 15s.

HALIFAX.—3½ h.p. Simms, vertical engine, magneto ignition, easy starter, reliable; £17 10s.

HALIFAX. — 1907 twin Rex, almost equal new, no complicated speed gears required; £22; buy now, to-morrow may be too late; allow £16 for 3½ h.p. Rex.

HALIFAX. — 4 h.p. Antoine, 26 wheels, low frame, trembler, girder forks, very fine mount; £16 10s.

HALIFAX.—Kerry, 3½ h.p., vertical engine, spray, very fine condition; £18 10s., perfect order.

HALIFAX.—5-6 h.p. Alcyon, twin, spring forks, N.S.U., two-speed gear, and sidecar; £27 10s.

HALIFAX. — 5 h.p. Rex, Lenguemare, trembler coil, Clincher tyres, Fishback belt; no offers; £16 15s.

HALIFAX.—1907 Rex de Luxe, magneto, twin tyre, Roc clutch, spring forks; £27 10s.; exchange wanted.

HALIFAX. — 1907 N.S.U. Lightweight, magneto, almost as new, stand, splendid climber; £22 10s.

HALIFAX.—Genuine twin Rex, guaranteed, spring forks, low built, goes like a flash; £16 given for 1906 Rex, £13 for 1905 Rex, £11 10s. for 1904 Rex, or £10 10s. for 1903 Rex in part payment.

HALIFAX.—3½ h.p. Minerva, 26 wheels, can be thoroughly recommended: £16, a bargain.

HALIFAX Motor Exchange. — Cash, exchange, or extended payments. See Tricar list. Telephone, 766. High-class machines purchased for prompt cash. — 16, Westgate, Halifax.

MOTOR BICYCLES FOR SALE.

MAUDE'S List of Second-hand Motor Cycles at present on hand.

MAUDE'S. — 3 h.p. Bradbury, 26in. wheels, new tyres to rear, beautiful puller; £10.

MAUDE'S.—2¾ h.p. Vindec Special, like new, magneto; £17.

MAUDE'S.—6 h.p. Rex de Luxe, magneto, twin tyres, Roc free engine, like new; £27.

MAUDE'S.—5 h.p. Rex, spring forks, tremblers, 1907 model, like new, including tyres; £22.

MAUDE'S. — Twin Rex, 2¼in. tyres, special machine, a beauty; £22.

MAUDE'S.—6 h.p. Rex, spring forks, beautiful condition; £19, our price.

MAUDE'S.—Clarendon, 3f h.p., M.O.V., spray, good tyres; £10.

MAUDE'S.—2¾ h.p. De Dion, spray, long handle-bars, Clinchers, foot brake; £10.

MAUDE'S. — Bradbury, 2 h.p., vertical, very good tyres; £8.

MAUDE'S.—2 h.p. Minerva, spring forks, spray carburetter, very good tyres; £8.

MAUDE'S.—2½ h.p. Lauder, low built, 26in. wheels, new tyres; £10.

MAUDE'S.—Beautiful 1905 Rex, in perfect order and condition; £12.

MAUDE'S. — Twin Minerva, 2½ tyres, splendid mount; £25.

MAUDE'S. — Ideal lightweights. Machines we can recommend as lightweights; 2 h.p. Minerva, £8; Ariel, 2½ h.p., £8; Mitchell, 2¼ h.p., £6.

MAUDE'S.—3½ h.p. Excelsior, M.M.C. engine, perfect, tyres practically new; £10.

MAUDE'S. — Minerva, 2 h.p., spring forks, £8; M.M.C., vertical, spray, 26in. wheels, trembler, £10.

MAUDE'S.—3 h.p. Noble, vertical, spray, very good tyres; £10.

MAUDE'S.—3 h.p. Fafnir, 26in. wheels, low built, long handle-bars, spray; £12.

MAUDE'S.—Humber, 2¾ h.p., a beauty, £9; 2¾ h.p. Kerry, spray, low built, B100 saddle, £9.

MAUDE'S.—Clarendon, 1906 model, 26in. wheels, ball bearing engine, enamelled green, absolutely like new; £15.

MAUDE'S.—3½ h.p. Centaur, vertical, free engine, 26in. wheels, B100 saddle; £16.

MAUDE'S.—Minerva, 2½ h.p., spray, very good tyres; a machine we can highly recommend; £12.

MAUDE'S. — 1906 Rex, footbrake, footboards fitted, an exceptional climber; £15.

MAUDE'S. — Twin Werner, 3½ h.p., a splendid climber, and very reliable; £18.

MAUDE'S.—Jap, spray carburetter, as new; £9.

MAUDE'S.—3½ h.p. M.M.C., vertical engine, 26in. wheels, spray carburetter, good tyres, powerful; £12.

MAUDE'S.—Rex, 3½ h.p., 26in. wheels, 1905 model, perfect; we guarantee this machine to be as new in every way; £15.

MAUDE'S.—Rex, low built, 26in. wheels, spray, trembler, good tyres, and a very fine puller; £12.

MAUDE'S. — 2 h.p. Quadrant-Minerva, spray, V belt, a very good lightweight; £8.

MAUDE'S. — Quadrant, new cylinder fitted, just overhauled, spray; a pity to miss this at £10.

MAUDE'S.—Lloyds, 2¾ h.p., B. and B. carburetter, £12; Rex, 3½ h.p., trembler, good tyres, Phœnix two-speed gear, fine puller, £15.

MAUDE'S.—Brand new 1908 Twin 7-8 h.p. Minerva, delivery yet to be effected from makers, guaranteed perfect; listed at £45, accept £36 spot cash; no offers.

MAUDE'S Motor Mart, Powell Street (behind Victoria Hall), Halifax, guarantee all the above to be in perfect running order, and ready for the road before delivery.

The F.A.M. and the End-to-End.

TWO or three American readers have called our attention to a paragraph published in the *Bicycling World*, New York, regarding American motor cyclists participating in the Auto Cycle Union's Land's End to John-o'-Groat's trial. The paragraph reads as follows: "It is likely that several American motor cyclists will 'cross over' to participate in this year's British reliability trial. If they do so, it will be in the nature of bidding good-bye to their amateur standing in America, that is, unless the British governing body alters its rules which permits amateurs and professionals to mix and to accept cash or medals at their option. The rules of the F.A.M. do not recognise that sort of shamateurism, and as the Amateur Athletic Union also has ruled against the acceptance of such 'amateurs,' American motor cyclists and automobilists who may hereafter compete under the peculiar and inconsistent foreign regulation now know what to expect." Last year Mr. T. K. Hastings was the only American competitor in the six days trials, and he was so pleased with the sporting nature of the competition, and the way in which English motor cyclists welcomed him, that he has expressed his intention of competing again, and has also endeavoured to induce others to accompany him to England this year to participate in the End-to-end trial in June.

According to the paper referred to, any competitors from over the water who take part in the British End-to-end trial will forfeit their amateur status in America, as the Federation of American Motor Cyclists does not recognise amateurism when amateurs and professionals are allowed to compete together, *and to accept cash or medals at their option*. It is news to us that the A.C.U. allows competitors in reliability trials to accept cash or medals at the winner's option, and the American writer has undoubtedly made a grievous error. Medals have been the only awards made in reliability trials since they were first organised. In the last Tourist Trophy Race cash prizes were offered, but not in the trials. We understand that the president of the Federation of American Motor Cyclists, Mr. Betts, is also the editor of the paper in which the paragraph was published, and it is almost certain that this gentleman has not yet mastered the rules of English competitions, or he would never have written threatening the excommunication of American motor cyclists who compete in the *private owners' class* in the End-to-end ride. With the exception of the private owners' classes, there has been very little said or done in England, or any other country, in the way of dividing professionals from amateurs in motor competitions. We have always advocated that it is advisable to have classes for riders who own their machines and pay all their own expenses, because it encourages them to enter and compete in events in which professional riders are entered without entering into direct competition with them; that is, if private owners think they have not the same chance as trade riders there is a special class for them alone. This is of assistance to the pastime, and we think it is a distinctly narrow-minded action on the part of the Federation of American Motor Cyclists to threaten to disqualify or professionalise all American amateur motor cyclists who compete in the End-to-end trials just because there are trade riders in the same event who are interested in the machine they ride, and whose expenses are paid by the firms they represent. From reports we have received, quite a representative

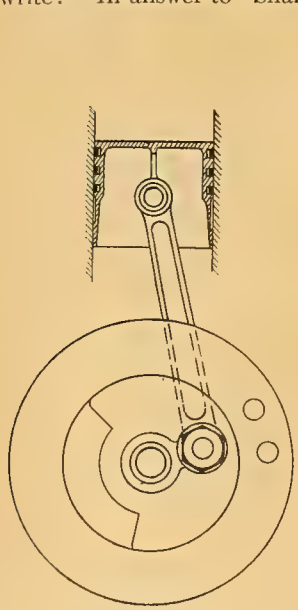
and enthusiastic little party of American motor cyclists expected to take part in the End-to-end ride this year, and we still hope if proper representation is made to the F.A.M., and it is explained that there is a separate and distinct class for private owners, and that they do not compete for cash and medals at their option, it might be induced to withdraw the threat of the president. It is to be hoped the opinion is not that of the committee, as the president has, so far, only published the paragraph in his paper, and there appears to be no definite ruling on the subject at present. As far as we can judge, there appears to be a considerable amount of latitude even with regard to "shamateurism" in the land of Stars, Stripes, and Trusts. According to a prominent motor cyclist in this country who has had considerable experience of American methods, at one time the League of American Wheelmen instituted a class which it called Class B amateurs who were employees of bicycle manufacturers. These men received a salary, bicycles galore, and all their expenses. They were obviously professional riders, but were never relegated to the professional ranks, and were conveniently styled "Class B amateurs." English sportsmen would not stand this sort of thing. A man is either an amateur or a professional. There should be no grades in either class.

The Balancing of Petrol Engines.

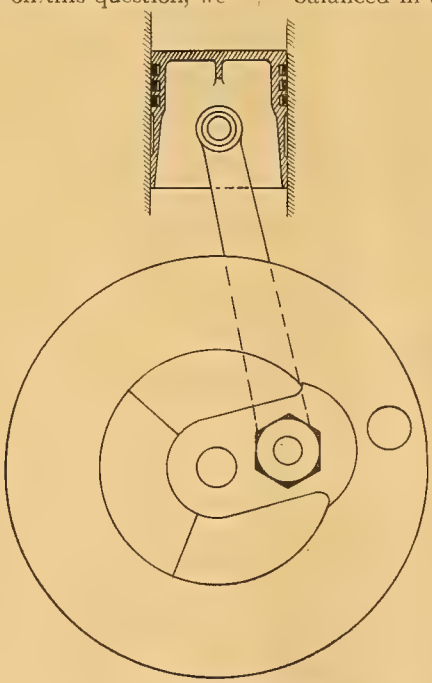
A FORTNIGHT ago a correspondent who signed himself "Shazbazzik" wrote a letter regarding the imperfect balancing of engines. This has aroused considerable interest, and further correspondence on the subject is published this week.

The Rex Motor Manufacturing Co., Ltd., Coventry, write: "In answer to 'Shazbazzik' on this question, we must take exception to the remark, 'Can anyone tell me why our best engine makers continue to make engines which are balanced in this way?' We think without egotism we can say we are at least one of the best British engine makers, having made petrol engines for the past eleven years, and having manufactured during this period certainly more petrol engines than any other firm in Great Britain, and probably in the world. Why he does not look to the oldest and largest manufacturers for this information we cannot say, but the enclosed drawing showing three types of Rex engines properly balanced is a proof that we at least know our business.

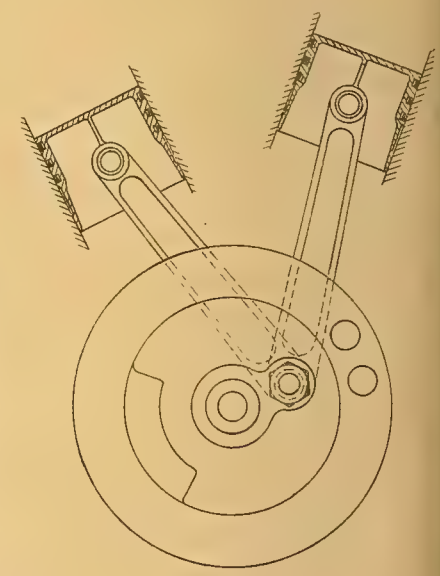
"With reference to the sketch, all Rex engines are balanced in the following monner, *i.e.*, every pair of flywheels have balance weights cast on them corresponding to the weight of the piston, connecting rod etc. In the event of the weight being found insufficient to obtain the true balance, holes are drilled on the opposite side of the wheel as shown in the sketch. The size of the holes and distance apart determine the adjustment of the balance."



2½ h.p. single cylinder.



5 h.p. single cylinder Rexette.



5 h.p. twin-cylinder.

On September 21st next the First International Rubber Exhibition will be held at the Royal Horticultural Hall, Vincent Square, Westminster, S.W. All classes of rubber articles will be shown, and those which will be of special interest to our readers will be tyres and their accessories, and also cables and insulated wires for ignition purposes.

We are informed by Mr. V. L. Fellows that he has accumulator repair shops situated in the most central part of London, namely, 49, Hertford Street, Mayfair, W. He undertakes the repair of any make of cell on the shortest notice and at moderate prices, and has always a large stock of Mayfair accumulators and second-hand batteries of other makes.

Through the Trough of Bowland.

WE had made the trip of the Trough more than once on foot, but had hesitated to face the ordeal of rough roads and precipitous hills on a motor bicycle, knowing that if our mounts should prove to be incapable of surmounting some of the steep gradients it was woe betide us, and for our sins we should be called upon for some stout and strenuous pushing.

I speak of the Trough of Bowland glibly enough as a Lancashire man, and the name is familiar to wheel ramblers in this part of the country; but for the benefit of others I might say a word or two in description of its situation and character. To begin with, Lancashire is a county that embraces many phases of life and scenery—the manufacturing and industrial, the agricultural and rural, the mountain and moorland in the North, and the sea. To those who go upon wheels the county of the red rose abounds in variety and interest, and in spite of its reputation for poor roads, not altogether merited in my opinion, there are hundreds of miles of really respectable going. Part of our present journey, it is true, was by roads that even ultra-civility could not describe as of the best, but, then, they are rarely used by light or motor traffic.

The Trough of Bowland.

Well, the portion of country which lies on the northern borders of Lancashire and Yorkshire is of the moorland type, known as the Forest of Bowland, although there is now little enough forest about it, and is characterised by wild and rugged moorland and hill, through which the clear streams gurgle over their stony beds, flanked here and there by pine and fir and mountain ash, and fringed with the emerald verdure which crops out brightly in the sheltered valleys and on the slopes at the foot of the sequestered hills. The road which runs through the Trough is the hill road and short cut from Lancaster to Clitheroe. Making the circuit from Preston, our journey was not a long one (some fifty miles or so), but we allowed ourselves plenty of time to pause and enjoy the beautiful scenery through which we should pass.

The Trip through the Trough.

Setting out, therefore, in good time one morning, a friend and I (he mounted upon a light Fairy and I upon a heavy touring machine) proceeded merrily through Longridge and the old-world village of Chipping, and thence, negotiating some tricky corners and sudden rises, to Whitewell the beautiful. Here the hills began to rise in brave array in front, and the way we had to traverse was indicated by a deep cleft in their serrated ridges. The weather had begun to look somewhat gloomy, and a cold north wind blew down the valley in our faces. The little Fairy chattered away pleasantly by the side of its big, slowly throbbing companion, and, in spite of the gloomy look of the sky, our spirits were high and our hearts light as we swished along, chanting lively melodies. The road, which had been good so far, now commenced to deteriorate, and at Dunsop Bridge we entered upon a mountain road in earnest. We began to climb sudden acclivities and drop down steep pitches on a road that clung precariously in places to the steep hillsides.

In response to a call for a halt, my friend brought up suddenly, and, losing his balance, as gracefully and softly as circumstances would permit, he spread himself over the fallen machine, and together they made a picturesque recumbent group upon the soft turf by the roadside. The carburetter and inlet pipe were knocked awry, but we soon put matters to rights, and after feasting our eyes upon the beautiful scenes around us we proceeded on our way, not without some fears of the steep and rough road that lay before us up the redoubtable Trough. A slight blue haze now began to follow each of us as we fortified our engines with copious draughts of oil in preparation for the worst part of the climb. The road had deteriorated into a rough, boulder-strewn track, in which fact really lay the difficulties of the ascent. The heavy tourist was sprung fore and aft, but was unable to travel at the necessary speed to keep up power. The low-geared machine promised more favourably, and a bend in the road brought to our view the forbidding cleft in the hills, well named the Trough, which should tax our climbing capabilities.

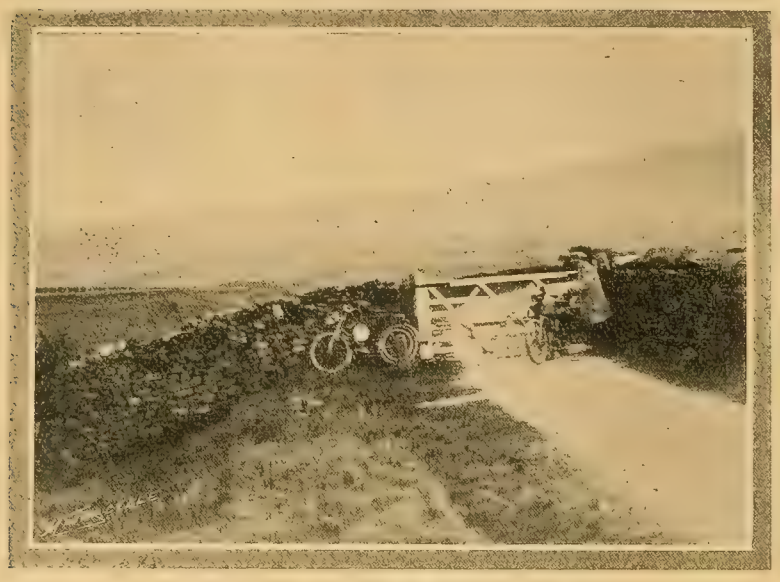
Near Dunsop Bridge.

Gradient 1 in 4.

The Fairy went first with a purring roar, and I

Through the Trough of Bowland.—

followed a couple of hundred yards or so in the rear. Although I was pretty busy keeping on the road, I noticed my companion throwing out a businesslike blue reek as he tackled the worst rise. I had no time to observe much, however, for my engine, slightly over-geared for this sort of country, was beginning to slow more than I liked. There was no pedalling gear on the machine, so I nursed the engine as well as I could, but



Across the Moors. One of the gates on the road.

the throbbing became weaker and slower, until at last I saw that if ballast were not thrown overboard there would be a full stop. I threw all the available ballast overboard, namely, myself, and commenced a lively quick-step alongside. It was without avail, and as the engine died away I looked up and saw my companion in similar straits. He had little weight to push, though, and soon won to the summit, whence he presently descended to help me push my 2 cwts. of refractory metal to the top. It was some consolation to look down the precipitous cleft and to think that, after all, it was exceptionally steep and exceptionally rough, but I felt vexed all the same that I had not a gear of five to one in place of my much higher one, or, better still, a variable gear. The contour book gives the hill as one in eight, so I should think it would be safe to say that there are portions nearer one in four.

We rested awhile after our labours at the top of the pass, regaling ourselves with sandwiches which we had brought with us, and taking copious drinks of the sweet water that bubbles over the clean stones in the mountain rivulets. Restarting presently, we descended the other side of the pass, which commences with only a moderate gradient for two miles. A brisk shower came on, and, not having recovered from the humiliation of the big-big push, I re-adjusted the carburetter, which I had purposely choked before setting out so that I should not run away from the lesser machine. W could see the road curling over the hills in front, an seeming hopelessly steep, but when the shower ha passed an improvement in our going seemed to tak place. We both tackled the steeps bravely, and mad light and fast work of the long ascent, given in th road book as one in ten—in reality, I am sure, muc steeper. We presently pulled up at a gate, of whic there are quite a number on this road. Sometimes the occur in awkward places, too, and one has t be very careful if a collision with one them is not desired. Besides, it is not alwa very easy to effect a start on the other sid The climb now became more gradual, an we felt to be getting to a tremendous heig on the bleak moors. Suddenly the Fairy engine went off at a startling roar. It w only the belt-fastener, and in a few minut we were again on our way, till we gained th highest point the roadway attains.

Magnificent View from a High Tow

Here from the "Jubilee" tower a magn ficent view of the country stretches below on all sides. Morecambe Bay is outlin like the coast line of a map. The billo mountains of the Lake District rise on t other side of the bay, and the familiar pea of the Langdales, Coniston Old Man, Bla Coombe, and many others which a La District lover might name confront us all their rugged majesty. South of the b Blackpool's tower and wheel are plain visible, and away round us the towerin forms of Ingleborough and Whernside and the w uplands of West Yorkshire contribute their quota the magnificence of the scene.

Getting astride our mounts once more, we made Lancaster, which could be seen from the tow Although only half a dozen miles away, those miles w pregnant with possibilities of trouble in the way steep hills and sudden curves and gates. To beg

The Jubilee Tower, from the top of which a manificent view is obtained.

Through the Trough of Bowland.—

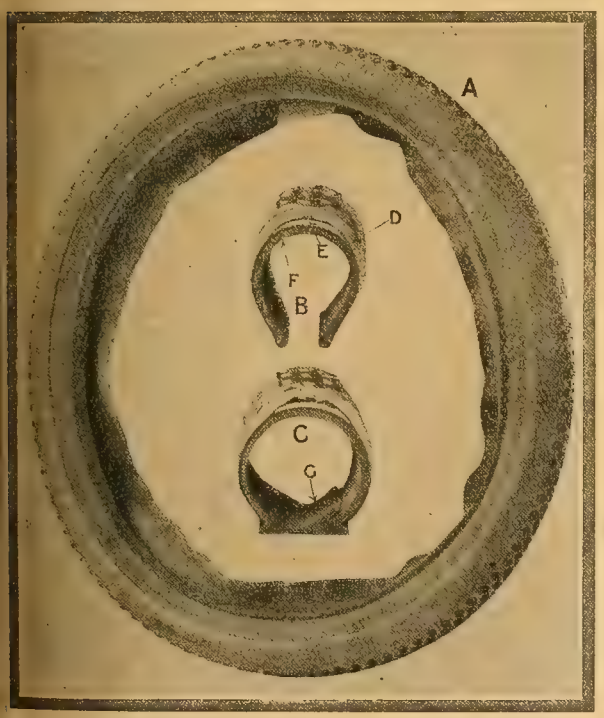
with, we dropped down a dangerous hill two miles in length, with an average gradient of one in ten. There is a right-angle curve halfway down, but although we were not aware of it we very fortunately had our machines well in hand. After negotiating the hill, a mile or two of comparatively level road gave us a little respite, until we reached the last "teaser." It was a tit-bit to finish up with, but our engines seemed to be pulling grandly—certainly mine was much better than it was in the Trough—and we took the bends in good style, and even started on a stiff gradient on the other side of a gate. That was the last hill, and we soon arrived in Lancaster, where we discovered that the small machine had been prodigally laying the dust with petrol from a leaky union. We remedied this, and after replenishing our petrol supplies to make up for the waste we worked our way through Lancaster's crowded and narrow streets, where Saturday market was being held, and out upon the good, broad, high road to Preston. It was a nice change to have a free and open seaboard, and we cantered briskly homewards, arriving in good time in the afternoon.

The trip was an arduous one, but we thoroughly enjoyed it. The light machine was, on the whole, more manageable in such a country, and more useful than the big machine, which latter ought to have been more suitably geared for the journey.

In conclusion, I would highly recommend the excursion to Lancashire and North-country men, but would say, have a variable gear, or, if a single gear, a reasonably low one—five or five and a half to one. There is a certain note of humour in the contour book's description of this road. Under heading "Objects of Interest," it is described as "dreary moorland road," which, in my opinon, is somewhat misleading. T. R.

Motor Cycle Tyres.

THOUGH they have been on the market for some years, the Michelin Tyre Co., Ltd., 49, Sussex Place, S.W., have not until recently pushed the sale of their motor cycle tyres. On motor cars they have given great satisfaction as regards durability and reliability, and are now used widely throughout the kingdom. The company's efforts have met with great success, which has resulted in their being honoured by receiving the Royal Warrant to supply Michelin tyres to His Majesty the King. In the manufacture of their tyres for motor cycles, the company have exercised the same care and skill as in the case of their car tyres. The motor cycle covers are strongly made, and have substantial treads. They are made either with beaded edges or with wired-on edges, and may be procured in various sizes, particulars of which will be sent on application to the firm.



The New Michelin Non-skid Tyre for Motor Cycles.

A. 26×2in. non-skid tyre.
B. Wired-on section—D, leather cover; E, strip to prevent studs reaching rubber; F, rubber cover.
C. Beaded edge section—G, flap to prevent "nipping" of tube.

The following remarks to be found in the 1908 Michelin Tyre Co.'s catalogue concerning the interchangeability of motor cycle outer covers will prove interesting. The 1⅝in. wired-on cover will fit a 1¾in. rim; the 1⅝in. beaded cover will do likewise; 2⅜in. and 2¼in. wired-on covers will fit 2in. rims; and 2¼in. beaded edge covers will fit 2in. rims. The 2⅜in. and 2½in. beaded edge covers require special rims. Michelin motor cycle covers are also made to fit Westwood rims. The Michelin butt-ended tube can be used with either wired-on or beaded edge covers.

A novel departure for 1908 is the Michelin-Semelle non-skid tyre for motor cycles. This is a reduced facsimile of the famous Michelin non-skid used with unparalleled success on motor cars for the last two years. The accompanying illustration clearly shows the construction of the cover. The studs, which are of hardened steel, project through a substantial leather tread vulcanised on to the cover, while behind the studs there is a thick leather strip, which effectually prevents the studs from penetrating to the inner tube. These non-skids are made with either wired-on or beaded edges, and it will be noticed that in the case of the latter a flap is provided to prevent the tube from being nipped.

The Centipede all-leather belt made by W. Pollin, of Spalding, has made a good name for itself both at home and abroad. It is a low-priced belt, capable of giving many hundreds of miles of satisfactory service. A

sample of a new pattern Simplex belt has reached us from the maker, and the drawing shows its construction. The introduction of the canvas core should make the belt still stronger and less liable to stretch and slip. The new Centipede belt is similar to the above, but stronger, having an extra strip of leather.

QUESTIONS & REPLIES

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and, whether intended for publication or not, **must be accompanied with a stamped addressed envelope for reply.**

Twin-cylinder for Passenger Work.

I have just purchased a 5-6 h.p. twin Antoine motor bicycle, Chater-Lea frame, which is geared 3½ to 1. Would you kindly let me know if I could fit a sidecar to this machine for my brother and I to use (our combined weights being twenty-two stones) on the road, say, from London to Exeter? Could you tell me about the number of miles per gallon I could expect with a Longuemare carburetter, No. 10 spray, on this combination?—M.C.

Yes, a sidecar can be fitted to the machine in question, and you could get about the country a good deal with only one gear of 4½ to 1, but a two-speed gear would be advisable if you do not wish to use the pedals on hills. The machine would not climb all the hills between London and Exeter unless a lower gear were fitted. The consumption would be about sixty miles to the gallon with sidecar.

Manipulation of Air and Throttle Levers.

Which of the following methods of driving would keep my 6 h.p. Riley engine the cooler? When I get going on level roads I close all extra air and then close throttle as much as possible without stopping engine. I then see if it will take any extra air and give it as much as it will take. Spark fully advanced. A friend of mine contends that my method of driving does not keep my engine as cool as it might do. He says if I opened the extra air about full and then throttled down as much as possible I should keep the engine cooler. His argument is (and it seems reasonable to me) that with the extra air fully open the suction on the jet is reduced, and that consequently I should get a weaker mixture than the way I drive, and that I should probably use less petrol.—BC 403.

We should say yours is the most effective method of driving, viz., to set the throttle at the speed at which you require to travel, and adjust the air to suit the quantity of gas admitted. If you open the extra air fully with throttle partly closed you will probably stop the engine. Again, with extra air fully open the throttle will require to be more open than actually necessary for a moderate speed, and engine will get hotter.

Gear for Tricar and Loose Bearing.

I have a 4½ h.p. tricar with Stevens engine, water-cooled, and it is geared 5 to 1. I find that it travels all right on level roads, but when I come to the slightest hill it slows down. Is this gear too high (passengers twenty stones), and if so, would you advise me to get a two-speed or variable gear? The big end of engine is very slack, and I have been trying to get at it, but I could not loosen the nut of flywheel, so I do not know whether it will require tightening or a new bush. What would you advise?—W.S.

The gear is about right for ordinary purposes, and the tricar should go up slight hills with comparative ease. The engine, without doubt, requires to be carefully overhauled, as there should be no play in the big end. A new bush will probably be necessary. Careful attention should be paid to the compression. Of course, no tricar is much use without a two-speed gear. We should, therefore, advise you to have one fitted, if possible. By reducing the gear still further the engine would most probably overheat.

Making the Engine Run at Slow Speeds.

The only fault I find with my Rex de Luxe twin is that it is too fast, and I cannot control the speed to much under 20 m.p.h., otherwise the engine stops. Do you think I could overcome this by fitting a smaller spray nozzle and choke tube? I do not know what number of nozzle I have in at present. Would this regulate the speed, say, to 20 m.p.h. or under? What would you recommend? I usually drive with the spark retarded one notch, the throttle almost closed, and the air full or half open.—G.H.A., N.B.

Try closing off the air supply still more when you close the throttle and attempt to make the machine run slowly. If this will not do you must fit a slightly smaller air adapter. Exactly what sized spray and choke tube are required can only be found out by experiment. It appears that the inlet valve springs of your engine are too strong. Procure two spare ones made of finer gauge wire or with a less number of coils in them, and you should be able to drive the machine regularly at ten miles per hour or even less.

Controlling Air Supply from Saddle.

The carburetter on my machine is a F.N. with a small hole on one side of spray chamber covered by a small cover moving radially on a set-screw. I am thinking of fitting a lever control to this. Would it be advantageous to make another inlet for air on the other side, so as to equalise the draught, and if so would the benefit be worth the trouble? In common with another enquirer in *The Motor Cycle*, I have had to solder up a small pinhole in the bottom of the spray chamber, thereby making a previously exceptionally bad starter, when cold, into an exceptionally easy starter, cold or warm.—E.W.C., Colchester.

Yes, an extra air inlet to the carburetter controlled from the saddle would undoubtedly be an advantage, and make driving more interesting. If you make an extra hole on the opposite side of the vaposising chamber, you would, of course, have to make arrangements to be able to close it. The latest patterns of the F.N. carburetter are fitted with an extra air inlet controlled from the saddle.

Difficulty in Starting and Running Slowly.

I have a 3½ h.p. Peugeot engine fitted to a Chater-Lea frame. The carburetter is a Longuemare. It takes me about five minutes to get the engine to fire, although there is a good spark at the plug. When once going I cannot throttle it down under eighteen miles per hour, which is not very safe on greasy roads. The carburetter is in good order, but I have to open throttle fully before engine will start. The contact breaker is clean, but I am renewing the platinum screw and blade, as they are worn. I may say the machine has always been known for its speed. A friend suggests a slow speed trembler coil. Do you advise this. J.H.C.

The symptoms entirely point to the air supply being too great. If you fit a smaller choke tube we think you will find the machine will run more slowly and start more easily. You must make sure that no air is being drawn into the engine owing to badly fitting nuts on the induction pipe, or owing to the throttle spindle being a very loose fit. This helps to make starting difficult. Do not use a trembler coil. It is not nearly so efficient as a plain coil.

THE LIVE AXLE.

WHAT IT MEANS.

THE LIVE BACK AXLE applied to a motor bicycle provides for the application of a starting handle on the axle, and permits of the same easy starting process as a car—distinct from the undignified and laborious method of pedalling. The ROC Live Axle system was initiated five years ago, and has since been incorporated with a perfect speed gear device under Patent No. 25054/06. Other makers are entitled to use the system under Roc license, **but the public are cautioned against infringements.** When ordering your new mount, specify **"live back axle."** It is the most important item in your specification. Most makers are already prepared to undertake this order, but in case of difficulty any competent agent can adapt the Roc Live Axle with Roc Clutch and Roc Speed Gear Appliance, or this company will undertake the conversion for you. The system means, of course, abolition of the pedal gear—a relic of the pedal bicycle. It enables one's machine to be controlled by foot levers precisely as a car. The appliance includes commodious footrests, and lends a new note of comfort to the rider.

If you already possess a serviceable mount, there is no longer the same need to change now this important improvement can be added. The inclusive price of the appliance and conversion is Ten Guineas. It is, of course, an integral part of the Roc machine marketed in two forms, viz.,

ROC, 4 h.p Single-cylinder Ball-bearing Engine .. .. .. 48 Guineas.
ROC, 5 h.p. Twin .. .. 55 „

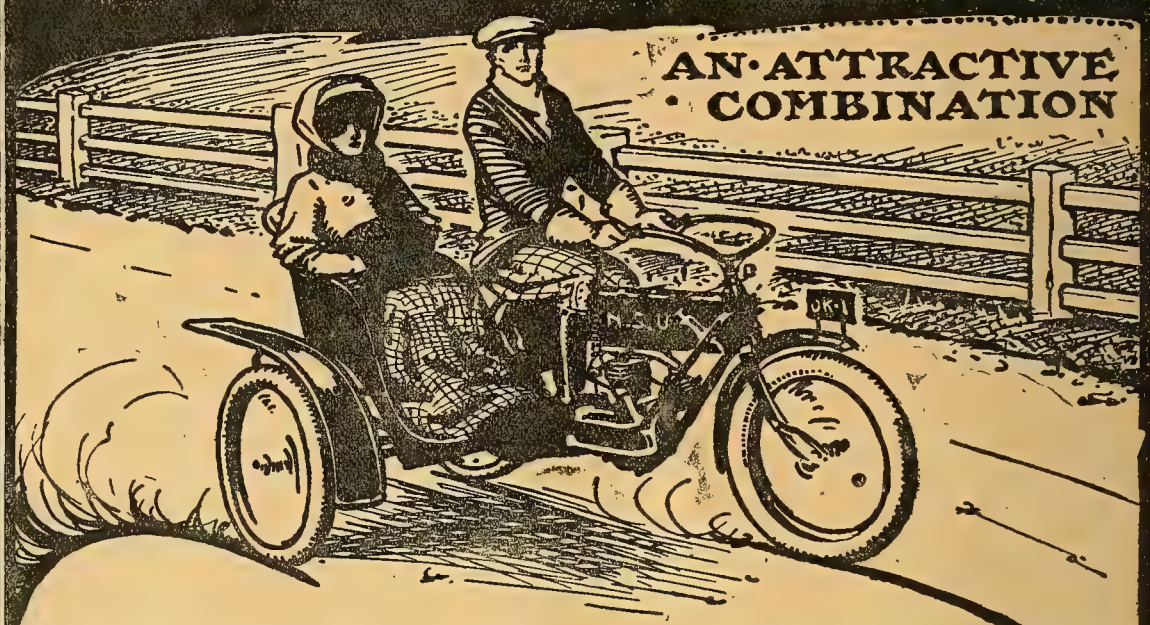
N·S·U



N.S.U. 6 h.p. Twin Cylinder, N.S.U. Side-car Attachment,

—the reliability of the former ensuring the safety of the latter. The N.S.U. Twin-cylinder is admirably suited to sidecar and forecar attachments. It is stoutly built, particular attention having been given to secure a strong rigid frame. Considerable thought, too, has been devoted to arrange the seat in such a manner as will enable the average rider to enjoy freedom of movement and comfort, and to converse in just the ordinary tone of conversation with companion. A point in favour of the N.S.U. attachment is that it can be adapted to any type of machine.

TO N.S.U. OWNERS. We have a repair department especially equipped and staffed to deal promptly and efficiently with all requirements. If your machine requires overhauling send it now. Spare parts can be supplied per return.

The N.S.U. Two-speed Gear can be easily fitted by just removing the ordinary pulley.

1908 Catalogue free on request.

Send for full particulars to—

N.S.U. MOTOR CO., LTD.,

78, Charlotte Street, LONDON, W.

A.J.W.

Gummed Up Piston Rings.

(1.) I have a 4½ h.p. Stevens motor bicycle, but find when trying to start that the back wheel sticks and will not go round. Have had belt off, and find that it is not the fault of the road wheel. Of course, I use the exhaust lifter. What do you think is the cause? Do you think the piston sticks? (2.) How can I find the gear of a motor cycle? (3.) Do you know any method of starting my engine on the stand, it being pedalless?—AUTO, Staffordshire.

(1.) See that the exhaust valve is lifting properly, and inject paraffin through the small tap on the top of the cylinder before starting. If there is no tap you had better have one fitted, or you will have to remove the sparking plug every time you want to inject paraffin. (2.) You find the ratio of gear between engine and road wheel by revolving the back wheel and counting how many revolutions the engine pulley makes to one revolution of the road wheel. (3.) There is no safe method of starting the engine on the stand without pedals, but on a well tuned up machine it can be done by smartly pulling up the back wheel over compression. Be very careful when attempting this or you might cut your hand or arm on the mudguard; it is a most dangerous practice. Why not have a free engine like the Roc, with a starting handle on back axle?

Proposed Alteration of Contact Breaker.

I have a 5 h.p. Riley tricar which has always given satisfaction except for one thing. The contact breaker is make and break, and the oil from crankcase works out on to it and accumulates on the platinum points, causing misfires, the temporary cure being to dismount and clean the oil away and re-adjust platinum points. To avoid this I am thinking of changing contact breaker to wipe. This, of course, would avoid need for trimming up platinums, but should I get good results from the change, or can you suggest any disadvantage likely to accrue from fitting wipe contact, other than the usual wear which takes place on fibre and ring, and would it be at all difficult? The coil is a Fuller Syntonic. I suppose no other alteration is required than fitting the wipe contact to half-time shaft?—ED 84.

You must bear in mind that a make and break contact breaker is more efficient than a wipe contact and more economical. The average contact breaker, if a good coil is supplied, will stand a good deal of oil, but when pitting ensues, added to dirty oil, misfiring occurs. Probably if you fit iridium points to contact maker and coil it will cure the trouble altogether. It is not the oil that causes the misfiring so much as pitting of soft platinum. We have often run a make and break contact breaker in a very oily condition if the points have been rather firmly adjusted. Of course, you can cure the leakage of oil by rebushing, or fitting a felt washer. If you fit a wipe contact cam must be changed.

A Novice's Interesting Queries.

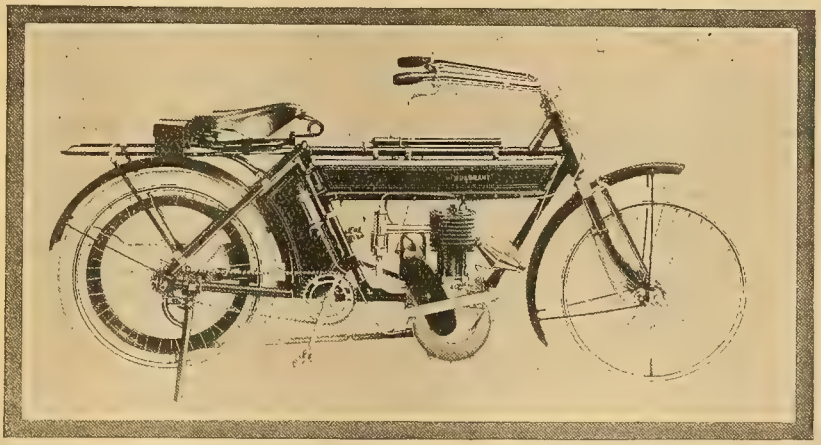
I have a 2¾ h.p. Kerry, 76 by 85 mm., plain coil, make and break, F.N. carburetter. When I advance spark lever half-way the machine goes well, but if I advance it fully the speed does not increase. The machine goes very well, but not fast enough. It takes all the air after starting, at slow or fast speeds. Do you think if I fitted a B. and B. or Longuemare carburetter I should get better results? The platinum points are properly adjusted as per your advice to other readers. Compression is perfect and carburetter clean, also batteries all right. I can climb a hill of 1 in 9 with a 5½ to 1 gear, but if I have a 4¾ to 1 gear I have to pedal. Kindly explain. Do you think that 1in. leather belt is too wide for a 2¾ h.p. engine? Another mystery is if I give a pumpful of oil every five miles I never notice smoke coming out of the silencer. Please explain why. My petrol consumption is about eighty to ninety-five miles per gallon.—C.H.E., Ruabon.

Probably the spark is advanced to its limit when the lever is half-way forward. You will improve matters by fitting a slightly larger choke tube, or else you could increase the size of the extra air inlet so that the machine will take the full amount of air when running at full speed. It is unnecessary to fit another carburetter. The performances as regards the two gears are about right. The lower the gear the slower the machine on the level, but steeper hills can be climbed. The engine does not smoke probably because the oil will stand a high temperature, and there is room in the crankcase for it; if the space between flywheels and crankcase is small the oil soon gets past the rings, as there is nowhere else for it to go, and when it arrives in the combustion head the heat of the explosions vaporises it. Some engines smoke immediately they are over-oiled, whereas others run better with a good supply of oil and do not smoke.

Output of 2¾ h.p. Engine.

(1.) Under ordinary conditions should a 2¾ h.p. Minerva take a rider of eleven stones up all hills? (2.) Does reboring increase the h.p. of a motor, and would you advise this being done, or does it weaken the sides of the cylinder too much? (3.) What would it cost, roughly, to fit a trembler coil and wipe contact in place of a plain and make and break? Would the result compensate for the outlay? (4.) Would iridium points on make and break last longer or require less frequent adjusting than platinum, and would they give better results?—J.G.B., Cardiff.

(1.) A 2¾ h.p. machine with an eleven stone rider should climb most hills without difficulty, but not all, unless the gear is sufficiently low. (2.) Reboring naturally increases the horse-power as it increases the diameter of the cylinder. Whether or not it will weaken the cylinder walls too much is a matter for the engineers who undertake the job to decide. Very few motor cycle cylinders are thick enough to allow for reboring, but compression may be improved by grinding out cylinder and fitting new rings. (3.) We do not quote prices. No, we should say it is not worth while to have a trembler coil fitted, and you would lose heavily in efficiency, though probably with it starting would be rather easier. (4.) Yes, iridium points would last longer, require less cleaning and adjustment, and give better results provided the coil has an efficient condenser.



The new pattern Quadrant is undoubtedly an improvement over its predecessors. The engine has a m.o.i.v., handle-bar control is fitted, longer handle-bars, a lower frame, foot plates, a round tubular carrier, and Price's stand. This new model is also neater, and has a symmetrical appearance.

¶ *"THE AUTOCAR," which is published under the same proprietorship as "The Motor Cycle," is to the automobilist what this journal is to the motor cyclist. Any reader of "The Motor Cycle" who is also considering the purchase of a car should make a point of obtaining "The Autocar"—the leading motor journal. Price 3d. Issued weekly.*

OCCASIONAL COMMENTS

By "IXION."

The Tyre Spoon Brake.

An interesting discussion in an American contemporary recalls the days when pedal cycles were fitted with a front brake consisting of a metal spoon, which was worked into pressure on the tyre itself by the usual lever. This brake is a distinctly powerful one, and whatever its defects, it does not wear the tyre, as was strikingly illustrated by a photograph published in *The Motor Cycle* last year. A stone stuck between the mudguard and tyre of a motor cycle, and the rider proceeded twenty miles with the stone rubbing on his tyre all the way; yet at the finish it was the stone that was nearly worn through, the tyre evincing no damage whatever. The explanation is the difference in the size of the two surfaces under friction, the brake spoon being perhaps 2in. long and the tread of a 28in. tyre over 7ft. The reason I mention this form of brake is that several times of late I have been consulted about an additional emergency brake for passenger combinations—both sidecars and tricars. The regular brakes have proved unequal to great stresses, and there is no room to fit another drum and band, while perhaps the contour of the tyre rim does not lend itself to a horseshoe brake. Under these circumstances I certainly ought to have suggested a tyre spoon brake, which is very powerful and very simply and inexpensively rigged up at home by any clever amateur. My omission is the greater because I have owned a small voiturette and an Eadie quad, each of which had a pair of these brakes. There is always the risk of a punctured tyre, of course, but it would be a rare case when tyre and brake collapsed together. I would a good deal rather rely on one of these brakes than on any other motor cycle brake of modern days, excepting only the belt rim shoe, and that, unfortunately, we cannot have in passenger work when we use a chain drive.

A Lubrication Point.

Some riders appear to find a marvellous difference in the running of their engines according to the brand of lubricant that is employed, while others find their engines so entirely indifferent to the consistency of oils that they are frankly incredulous about the troubles of their less fortunate brethren. Wherever I have found an engine supremely sensitive to the quality of its lubricant, it has been an engine in which there was only a very limited clearance between the flywheels and the crankcase. Of late most makers have slightly increased this clearance, and this disturbing sensitiveness to brands of lubricant will, I fancy, practically disappear during 1908. Two instances have come under my notice this week. One is a letter from a friend, who says his 1908 mount will accept any lubricant, whereas the 1907 edition of the same make always sulked unless fed with a particular oil. A second is the experience of a maker, who had an engine returned to him because it would not climb hills. He tried a fresh oil with it, and it behaved admirably; and to cure this tendency he is enlarging the flywheel clearance. Where this sensitiveness exists, it is sometimes possible to cure it by reducing the web at the top of the crank case.

An Extraordinary Experience.

A well-known athlete underwent an extraordinary experience on one of the early rides of his novitiate. I wonder if any rider can parallel it? His single-cylinder vertical engine had its gudgeon pin secured by the set screw system of odious memory. One of these set screws came adrift after the fashion of the wee beasties. As some of us know, this usually means a wrecked engine. But perhaps because the aforesaid athlete used his motor cycle for business purposes and not for sinful scorching his fate was very different. The errant set screw emerged from the engine *viâ* a hole it knocked for itself through the wall of the cylinder; but, the owner's lucky star being in the ascendant, this hole was at the very bottom of the piston's stroke. Consequently the engine continued to run, and with increased power, owing to the freer exhaust. The rider puffed blithely to his journey's end, somewhat bespattered with oil, and creating no small barking. He still rides with the same cylinder, albeit with a plate clamped around the auxiliary exhaust hole. Some men have all the luck. But why, in the name of all that is wonderful, did that screw emerge sideways through the cylinder? One would have said the piston could only jerk it against the glass-smooth cylinder wall at a very acute angle, and, if so, how did it make its way clean through? Truth is again stranger than fiction. I should never have dared to incorporate such an idea in one of my motor cycling yarns.

Magneto Switches.

A rider enquires why accumulator switches and magneto switches work in directly opposite ways, the accumulator switch opening up a gap in a previously complete circuit, and the magneto switch bridging a gap already existent. The accumulator switch is a "cut out" switch; it stops the firing by interrupting the primary circuit, and so preventing the electricity stored in the accumulator from circulating. Hence this switch opens up a gap. With the magneto, on the contrary, we have not got to deal with stored electricity at all, but with a current that is being constantly generated, and not only generated, but simultaneously impelled over a circuit; if we broke this circuit by a cut-out or interrupter switch, the current would continue to accumulate at and behind the point of rupture, and would burst a path through some part of the insulation. Consequently, instead of breaking the circuit, we open up a new and shorter circuit which guides the curent away from the sparking plug, and so stops the firing without damaging the magneto. Consequently, a magneto switch is nothing more or less than deliberately procuring a short circuit.

Watawata

POWER POSSIBILITIES

The actual limitations of your machine's power are never touched unless it is economised and rightly directed. That is what the Watawata is for—to show you just what can be done if all power wastage be checked.

There's no question of slipping or stretching about the Watawata—it preserves its tenacity of grip under all conditions. Motor cyclists everywhere praise it and we cannot recall a single instance of dissatisfaction.

"JUST ARRIVED."

To All Motor Cyclists

who have been waiting the arrival of a perfect "all rubber" non-skid Motor Cycle Tyre, this latest arrival from the PETER UNION FACTORY will appeal with peculiar interest. Some special points to note—the Basket pattern tread, its extension over the walls of the cover, the large amount of rubber which ensures great resiliency without loss of speed, and offers sure resistance to punctures.

Write for particulars to—**PETER UNION TYRE CO., LTD., 6, Upper St. Martin's Lane, London, W.C.**

Some Interesting Accessories.

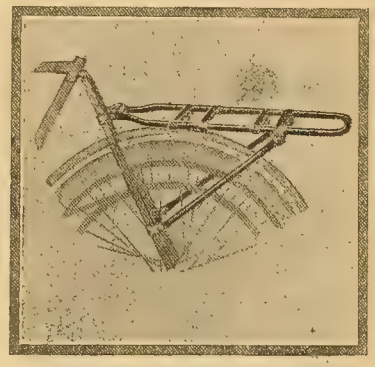
SINCE the early introduction of the motor cycle the firm of Lycett's Rawido Belt Co., Ltd., Bromley Street, Birmingham, has always catered for riders' wants, and can be relied upon to turn out articles of practical value, the principal, Mr. E. Lycett, being an enthusiastic motor cyclist himself.

The Lightning stand, new pattern, for attach ng to chain stays.

[Lycett's rubber and canvas belt with transverse grooves top and bottom.

The latest introductions of this firm are a new pattern Lightning stand, which is attached to the chain stays to facilitate the removal of the rear wheel while the machine is jacked up. The other well-known features of the Lightning stand are retained. A round tubular carrier is another new accessory illustrated in this article.

The remaining illustration is that of a new registered pattern of rubber and canvas motor cycle belt. The transverse grooves, which are moulded in the rubber during the process of manufacture, unlike other patterns, are moulded both on the top and underneath the belt, but, as will be observed from the illustration, the under grooves are altogether finer than those which are provided at the top. The double grooves should tend towards greater flexibility. An important point in connection with this belt, but not shown, is the Lycett patent fastener. Most readers know the Lycett fastener for leather belts, and how quickly it can be attached or detached. The same system has been adopted for the new rubber belt. It is fitted with metal eyelets during the process of manufacture, without injury to the rubber or canvas, and as a rubber belt does not stretch as rapidly as a leather one, it has been possible to reduce the number of holes at each end.



The tubular carrier for motor-cycles.

Experiences with a Twin-cylinder Lightweight.

OUR first riding experience with the lightweight twin-cylinder Moto-Rêve was on the day of the quarterly trials last January. On that occasion the roads were atrociously bad. For days previously alternate frost and thaw had rendered the surface a mass of greasy ruts, intermingled with slush and new metal, and we cannot recollect having seen roads in a worse condition. We rode the machine about sixty-five miles that day, and our first impression was distinctly good. There was an entire absence of side-slip or unsteadiness, and the Druid spring fork absorbed all vibration. The handle-bar control is well nigh perfect. On the left side of the bar are two small levers—one fixed horizontally controlling the throttle, the other underneath the handle grip operating the double valve lifter. Once the extra air lever is set the carburetter works quite automatically, although it is an advantage, we find, to open the extra air hole on the carburetter if a long hill has to be climbed with the throttle full open. Since our first ride in January the Moto-Rêve has been ridden a further 250 miles without the slightest adjustment being required to the engine or magneto—in fact, we have not found it necessary to place a spanner on those parts. The round twisted belt has given very little trouble, the record up to date being one broken belt fastener. On a long ride, if there is any sign of slipping, the belt can be instantly tightened by means of the jockey pulley, but there arrives a time—usually at the end of about 100 miles—when the belt requires shortening. This is best done by cutting a piece out, as it is inadvisable to shorten the belt by twisting the coils closer together. In a few weeks the company will be in a position to supply machines with a direct drive and V belt in place of the round belt and jockey pulley. Under favourable conditions the machine will average a little over twenty miles an hour on average roads. It climbs hills splendidly considering its power, and recently successfully negotiated a steep hill outside Stratford-on-Avon on the road to Bidford, locally known as Bardon Hill. With about thirteen stones in the saddle it climbed a little over three parts of the way without pedal assistance, and with a few light strokes of the pedals the remainder was ascended practically without exertion. Regular readers of *The Motor Cycle* will remember that we were the first to call attention to this miniature twin-cylinder engine, a description and illustration being published on May 22nd, 1907. We are continuing our experiments, but in the meantime we know readers will be interested to hear our experiences with this new pattern lightweight. It is a most pleasant little machine to ride, is very silent, gives no trouble, and is just the machine for those riders who desire a lightweight with some reserve power. The engine and magneto are beautifully made—in fact, this portion of the machine is a marvellous example of ingenuity and compactness. If the machine continues to give the same satisfaction as it has done up to the present, we shall have no hesitation in recommending it as quite the best of the lightweight patterns that we have yet had the opportunity of riding. Riders of about ten stones would find the machine a far better hill-climber than we have done. The makers are the Moto-Rêve Co., 138, Gray's Inn Road, W.C.

Expenses in the End-to-end.

By B. H. DAVIES.

THE editor has asked me to give intending competitors some idea of their probable outlay in the End-to-end. I have no doubt the R.A.C. Journal will publish a theoretical balance sheet, as I believe it did in 1906, but I must warn any rider whose pocket will only run to the minimum that unexpected expenses are often encountered on a prolonged motor cycle ride. I myself considerably exceeded my estimates, owing to various causes. All I can do in this article is to indicate the minimum, and riders can then judge for themselves whether they care to face the chance of exceeding it. The point is that when a rider has got a certain distance he will be intent on finishing at any cost, and though some accident may necessitate professional help in the way of repairs, which disqualifies for a gold medal, he would nevertheless pay for it rather than not finish the course.

As regards the journeys to the start and from the finish. Penzance can be reached in a long day from London on a motor cycle, but if time is to be allowed for overhauling it afterwards, as is only prudent, the cost of meals and beds will exceed the railway fare. The same is true of the return journey from Wick. The A.C.U. may arrange cheap tickets to Penzance, but the saving will be small.

The A.C.U. makes special terms at all the hotels, averaging 8s. 6d. for supper, bed, breakfast, and attendance, say 9s. with tips at the lowest. They also arrange for a midday lunch at a cost of about half a crown; cheaper lunches may be had, but riding creates an enormous appetite, and as there is often no chance of a proper afternoon meal, it will be found false economy to go to a cheaper house for lunch. There is also the supreme advantage that there is no tiresome waiting for the official lunch.

My estimate is liable to be exceeded by means of tyre replacements, refreshments between meals, and sundries. It must also be remembered that a rather costly kit of spares, in which extra inner tubes are the largest item, is required before starting; that the rear outer cover is likely to exhaust about half its life; that clothing, goggles, horn, lamps, etc., are quite likely to need some expenditure after the run; and that several small spares in the way of plugs, belts, etc., are fairly certain to be used up.

ESTIMATE.

Entry fee, £2 2s. (members of A.C.U., private owners); add subscription and entrance fee—town members £1 6s., country ditto 15s. 6d. ...	£2 17 6 to	£3 8	0
Fare, London to Penzance		1 5	3
Motor bicycle, owner accompanying, owner's risk		9	0
Fare, Wick to London		2 13	3
Motor bicycle, owner accompanying, owner's risk		12	0
Hotels—Eight beds, suppers, and breakfasts, at 9s. per night		3 12	0
Eight lunches at 2s. 6d.		1 0	0
Petrol—900 miles, 100 miles per gallon, at 1s. 4d. per gallon		12	0
Oil—say one gallon at 4s.		4	0
Minimum expense	£13 5 0 to	£13 15	6

RIDING HINTS.

THE difference in the amount of attention bestowed by motor cyclists on their machines is amusing. One man likes to put his machine away at a week end and take it out the next without having touched it in any way—in fact, rides it until it won't go any longer—and the other, usually the most enthusiastic rider, is never happy unless tinkering and trying to improve his machine. Fortunately, present day motor bicycles need very scant attention, and, although it is not wise to wait until one gets on the road to find something needs adjusting, we do not encourage riders to do too much dismantling "to see how the wheels go round." A certain amount of periodical attention to a motor cycle is desirable and necessary, and does much to prolong its life, and a few minutes spent in looking over the machine before starting out ensure an enjoyable day's run. We have recently received some very practical hints from a Partick motor cyclist who has had a 3 h.p. Triumph machine two years, during which time he has ridden it well over 6,000 miles, and as much as 208 miles in a day. He assures us that, although his machine has had to carry fourteen stones regularly, it is as good now as the day he got it except for the tyres, and it has never been in a repairer's hands.

In addition to the usual tool bag, he carries a spare one full of tools and spare parts. Many of his friends laugh at him, but are nevertheless very glad to meet him on the road if they are in trouble.

Some Useful Tips.

Here are a few interesting particulars of the little alterations made and attention paid to the machine. He first bent the levers in towards the centre line, as they previously stuck straight up and caught on his trousers. They were set in exactly 1in. Next the steel split pins were all taken out and replaced with copper ones. The rubber tube connecting the oil pipe to the crank case was made a screw coupling, which entirely prevented any leakage. At the ends of the footrests side plates were fitted, similar to those on a pedal, to prevent the feet from slipping sideways. Whenever he returns after a ride over muddy roads he puts little oilskin covers made out of linen cloth soaked in linseed oil and dried, similar to a seaman's oilskin coat, over the carburetter and magneto, and throws buckets of warm water all over the machine, or uses a hose till all dirt is off, then dries down with white clean waste. [We think the oilskin covers should be extended to the wheel bearings, otherwise there is great risk of washing grit into the bearings.—ED.] Afterwards he paints all over the machine excepting the saddle, toolbag, and tyres with paraffin. A special paint pot and sash tool are kept ready for this work. Once every fortnight, whether the machine is used or not, the lamp, horn, and all silver plated parts are "painted" with paraffin, and there is not one single spot of rust on any part. A motor cycle naturally commands a higher price second-hand after careful usage.

THE MOST COMFORTABLE MOTOR CYCLE in the WORLD.

The reasons why the average motor cycle is uncomfortable are numerous; three occur to one's mind immediately:

1. The excessive weight, which makes it difficult—at times dangerous—to handle
2. The overlarge engine, which develops its power too vigorously—especially when working slowly
3. The difficulty of control when riding through towns, round blind corners, in winding lanes, etc.

The MOTO-REVE removes all th se objections.

1. It scales under 80lbs
2. Its 2 h.p. two-cylinder engine runs with a gentle purr, yet is powerful enough to carry the rider up any hill.
3. Its handle-bar control enables the rider to regulate his pace by a touch of the finger.

Spring Seat.

What is the Best Title for This?

A Novel Competition for Photographers.

£15 IN PRIZES.

In this week's "**Photography**" (dated March 17th) is a coupon, to be filled in with the best title for this picture and sent in, with a Postal Order for 6d., to the Editor. The whole of the money so obtained will be distributed in prizes, and in this (the first of the series) the Publishers guarantee a minimum of **£15** as the prize money. All entries have to be in by March 24.

FIRST PRIZE = = = = £5.

The issue of "**Photography**," dated March 17th, is on sale this week at all Newsagents and Bookstalls, price 1d., or will be sent post free for 1½d. on application to the Publishers—Iliffe and Sons, Ltd., 20, Tudor Street, London, E.C.

CURRENT CHAT

Special Feature

THE BALANCING OF PETROL ENGINES :
INTERESTING CORRESPONDENCE.

International Auto Cycle Tourist Trophy Race.

Mr. M. J. Schulte offered to present a silver cup to the winner of the above race, and one gold medal each to the second and third in the single-cylinder class. The A.C.U. Committee thanked Mr. Schulte for his kind offer, which they have been pleased to accept.

Ripley Roadmenders' Dinners.

The second of the dinners and entertainments to roadmenders employed on the Ripley Road took place on Saturday last, at the White Lion Hotel, Cobham, when about thirty-six men were entertained. The A.C.U. secretary will be pleased to receive further contributions to the dinner fund.

The Auto Cycle Union.

At the end of last year thirty-three clubs were affiliated to the Auto Cycle Union, representing a total membership of about 1,900. The A.C.U. Revenue account for the year ending December 31st, 1907, shows a turnover of £745 17s. 6d., with a small deficit balance of £13 12s. 5d.

A Gymkhana in Germany.

Prince Louis Ferdinand of Bavaria has accepted the honorary presidency of a gymkhana which is to be arranged co-jointly by the Bavarian Motor Club and the German Motor Cycle Association for cars and motor cycles on July 28th, at Munich. Prizes are valued at £75, amongst the donors being His Royal Highness Prince Ferdinand of Bourbon, the Duke of Calabria, the Munich Corporation, and the organising club and association.

Private Hill-climbing Trials.

Last week-end we were invited by Mr. M. J. Schulte to witness some trials on Edge Hills with a number of 3½ h.p. motor bicycles just out of the Triumph shops—their test climb, in fact. In all there were ten 1908 model machines, and it says much for the accuracy of finish and the systematic production of the machines under mention that all successfully scaled a noted Warwickshire hill which has a gradient of 1 in 6 at the steepest part. Added interest was infused into the trial by the unexpected appearance of those two rival and enthusiastic amateurs, O. L. Bickford and W. G. McMinnies, of Oxford. They did not hesitate to try the paces of their respective machines —a Triumph and a Vindec against one another, but in two trials honours were even. Both machines were in excellent tune, and climbed the hill without slackening speed.

No Revenue Tax in Ireland.

It is not generally known that there is no revenue tax on motor cycles or motor cars in Ireland.

Police Trap at Edgware.

We have received information of a trap working in various positions at Edgware, both day and night, and sometimes as late as midnight.

The Number of Motor Cycles in Germany.

From the annual automobile census just taken by the German authorities for the whole Empire we note that at the beginning of January there were 19,573 motor cycles in Germany, or 3,800 more than twelve months previously.

Dangerous Dogs.

It is a matter of general interest to motor cyclists that a cyclist residing in Staines has been awarded £150 for damages sustained through a large Airedale terrier rushing at him and knocking him over. There is no doubt that some dog owners do not take the trouble to prevent their pets rushing after road vehicles, and a lesson or two such as the above will doubtless affect a speedy alteration.

Brooklands First Open Motor Cycle Race.

Motor cyclists will welcome the news that the first Brooklands motor cycle races, consisting of a match or private sweepstakes and other events, are included in the B.A.R.C. Easter programme. The dates of the Easter meeting are Saturday, April 18th, and Monday, April 20th. We have, as our readers are aware, frequently urged the encouragement of motor cycle racing on the Brooklands Track, and we look forward to a well filled entry list and some good sport. We shall publish the conditions in a future issue.

Motor Taxation.

The Sheffield and Hallamshire Motor Cycle Club has sent us a copy of a letter which it has addressed to five members of Parliament who represent the electors of Sheffield and district. This letter is signed by the committee of the club, and asks the Parliamentary representatives for their valued help in watching future legislation, especially when the forthcoming Budget and the new Motor Car Act are introduced. The letter points out that motor cyclists have been very unfairly dealt with, and have been actually taxed higher in proportion than car owners. In proof of this the average value of a car weighing under one ton is given as £350, and that of a motor cycle as £15. On this basis the autocarist pays 2¼d. in the £ taxation, while the motor cyclist pays 1s. 8d. in the £, or eight times more per cent. than the autocarist. Other motor cycle clubs might reasonably follow the example of the Sheffield and Hallamshire M.C.C., and so prevent further injustice to motor cyclists, who are threatened with additional taxation on the recommendation of the Royal Commission. Club secretaries can have a copy of the above letter on application to the Editor of *The Motor Cycle*.

Damages for a Guards' Officer.

Lieut. F. R. Harford, of the Scots Guards, was awarded £500 damages in the Law Courts last Thursday against Mrs. Alice Gray Hubbard. He was riding a motor bicycle at Aldershot when he was knocked down by Mrs. Hubbard's motor car, and so badly injured that an operation was performed, and his left leg is now shorter than the other. In summing up Mr. Justice Darling said Lieut. Harford was an officer in what remained of the Scots Guards, and it was necessary that no harm should come to him, because he gathered that officers were exceedingly scarce. It might be expedient to reduce the Scots Guards, but it was not expedient to reduce the officers unevenly.—*Daily Mail.*

The Royal A.C. Annual General Meeting and Annual Dinner.

On the afternoon of the 12th inst. the annual general meeting of the Royal Automobile Club was held in the old War Office buildings, on the site of which it is proposed to erect the club's new premises. The report of the year 1907 was an interesting, lengthy, and momentous one, of which a considerable portion was devoted to the doings of its vigorous offspring, the Auto Cycle Union. Mention was also made by the chairman, Mr. C. D. Rose, M.P., of the dissolution between the R.A.C. and the Motor Union. The same evening, at 8 o'clock, the R.A.C.'s eleventh annual dinner was held at the Covent Garden Theatre. The function was one well worthy of the august body which was responsible for its organisation. Amongst the guests were Prince Alexander of Teck, the Chinese Ambassador, the Greek Minister, the Swedish Minister, Sir Edward Henry, and numerous other notabilities. After the dinner a splendid entertainment was provided, which included performances by the most famous of the shining lights of the variety stage.

Motor Cycle Races at the Stadium.

A permit has been granted to the proprietors of *Cycling* to hold motor cycle races at their meeting to be held at the Stadium, Shepherd's Bush, on Saturday, May 9th.

The Shepherd's Bush Track.

Whether or not the racing track at the Stadium is the fastest and most suitable one in London for motor cycle racing, it is interesting to note that the two most important annual race meetings, the Auto Cycle Union and the Essex Motor Club, are down for decision at the Shepherd's Bush track. A well-known racer does not consider it faster than Canning Town, and it will be interesting to note the speeds accomplished at the first meeting on May 9th.

The Life of a Motor Cycle Engine.

Mr. R. C. Clincker, of Clifton-on-Dunsmore, near Rugby, has forwarded for our inspection some parts of a 2¾ h.p. genuine De Dion engine which has run 18,000 miles, fitted most of the time to a Trimo attachment with Phœnix two-speed gear. The parts sent were the gudgeon pin, crank pin, two connecting rod bushes, and a piston ring. As Mr. Clincker says, the condition of the parts is a striking testimony to the first-class material and workmanship put into these engines. We have seen the same parts in some other makes of engines entirely worn out in less than half the distance. It would be interesting to know whether the long life of the old pattern De Dion engines is due entirely to superiority of material and workmanship, or to the fact that these engines had rather a low compression, and were usually fitted to machines having a gear ratio much lower than those employed in the majority of cases nowadays.

The Economical Motor Bicycle.

A Fifeshire reader tells us in a query respecting a new machine that during the whole of 1907 the total expenses with his motor bicycle—a 2 h.p. Quadrant—amounted to only £6. He cannot say how far he travelled in that period, but assures us that he enjoyed rides most week-ends.

Annual General Meeting of the A.C.U. Council.

Delegates attending the annual general meeting of the A.C.U. council on Saturday next are hereby reminded that the venue has been altered to the Imperial Restaurant, 60 and 62, Regent Street, W.

The Number of Licensed Motor Vehicles.

Regarding Mr. John Burns's recent statement in the House of Commons that license duty was paid on 76,567 motor vehicles in 1907 (*not registered*, as a writer in a contemporary has it), many overlook the fact that no license duty is paid on motor cycles or cars—amounting to several thousands—used in Ireland. Obviously, the above figures, whether right or wrong, apply to private motors in use in England, Scotland, and Wales only.

Motor Cycles in the Grand Duchy of Baden.

An extraordinary rise in the number of motor cycles in the Grand Duchy of Baden is to be chronicled. Whereas on January 1st, 1907, this class of automobile numbered 596, exactly a year afterwards they numbered 843, which means an increase of some forty-two per cent. Only eight cycles were used for carrying goods, and as to the rest, it is interesting to note how large a percentage serve commercial, professional, and agricultural ends. We furnish an analysis of the latter category from this standpoint. In the service of public authorities (post, army, corporations, etc.), 2 cycles (1 in 1907); for purposes of trade and industry, 485 cycles (376 in 1907); for professional use (doctors, land surveyors, etc.), 64 cycles (same as 1907). The number of cycles acquired for mere sport or amusement jumped from 135 to 279.

FUTURE EVENTS.

Mar. 21—A.C.U. Annual General Meeting of Council.
" 21-28—Cordingley's Motor Show, Agricultural Hall.
" 28—M.C.C. Opening Week-end Run to Brighton.
April 4—Lewisham A.C. Open Hill Climb for Motor Cycles
" 16-20—M.C.C. Easter Tour.
" 18 and 20—Brooklands Car and Motor Cycle Races.
" ——A.C.U. Quarterly Trial.
" 19 (Easter Monday)—Lincolnshire M.C.C. Hill Climb.
May 2—M.C.C. Members' Hill-climb.
" 9—Brooklands Motor Races.
" ——A.C.U. Annual Hill Climb.
June 5-8—M.C.C. London-Edinburgh Run and return for Schulte Cup Competition, and special cup for motor bicyclists.
" 27—M.C.C. Inter-team Trials for "The Motor Cycle" Challenge Cup.
" ——A.C.U. 24 Hours Ride.
" ——A.C.U. Land's End to John-o'-Groat's Six Days' Reliability Trial.
July 25—Motor Cycling Club's Petrol Consumption Tests.
Aug. 3-4—M.C.C. Run from London to Land's End and Back for Charles Jarrott Cup.

A.C.U. Open Hill-climb Hill Wanted.

Sir F. S. Philipson-Stow, Bart., advised the Auto Cycle Union that he would be unable to allow the use of the grounds at Blackdown House, Haslemere, for the purpose of holding the annual hill-climbing competition this year. A letter of thanks has been sent to him for kindly allowing the use of the grounds in the past, and expressing the hope that at some future date the Union might again be allowed to hold the competition there.

An Unreasonable Request.

The County Council of Shetland has applied to the Secretary for Scotland to approve of a law prohibiting motors travelling at a greater speed than ten miles per hour. It is a somewhat ridiculous request, as our informant says that one may travel miles without sighting a house, and there are only two motor cyclists and one autocarist in the whole island! "Can nothing be done to oppose the county council?" he asks. The question is one that the governing bodies have taken up on our recommendation.

Cordingley's Show.

By courtesy of Messrs. Cordingley and Co. members of the A.A. will be admitted free to the Agricultural Hall every day during the exhibition from March 21st to 28th on presentation of their membership ticket. Free space has also been granted the Association for a stand on the ground floor of the hall, where the secretary and some of the staff will be in daily attendance.

A Big Programme.

In addition to the winter hill-climb organised by the Lewisham A.C. for the 4th prox. (locality known only to competitors), the club proposes holding a similar form of competition at Westerham during the year, also a speed judgment contest, consumption trial, penalty run, non-stop run, and two reliability trials.

Bombay to England by Motor Cycle.

Lieut. Edward Noel, who we announced some weeks ago intended to ride home from India by way of the Balkans, Austria, Germany, and France, on a motor bicycle, advises us that he hopes to start about the middle of next month. He has fitted his 3½ h.p. Triumph with an Osborne four-speed gear, an N.A.B. spring seat-pillar, and the heaviest motor cycle tyres. He will carry as spares one Whittle and two Shamrock-Gloria belts, and two spare inner tubes. He is wondering whether in case his petrol supply ran short in Asia Minor or Turkey, he could use paraffin as fuel. This should be quite possible, provided he does not allow the engine to get cold before starting up on the paraffin. A Brown and Barlow carburetter will run an engine on paraffin, but it is almost impossible to start the engine when stone cold with this fuel. Paraffin should only be used as a makeshift, however, as thick deposits accumulate on the valves, piston, and cylinder heads, necessitating frequent removal of the cylinder.

Track Racers.

With the encouragement that is to be given at the Stadium to motor cyclists, there should be a number of recruits to the ranks of track racers this year. There are a lot of prizes to be competed for, not only at Shepherd's Bush, but throughout the country, particularly at holiday times, and the field of competitors is comparatively small.

Ten Miles Limit at Bromley.

Last week the official notice duly appeared that the ten miles speed limit at Bromley, part of Beckenham Road, including Swan and Mason Hills, was to come into operation from Monday last, the 16th inst.

Sale of a Famous Racer.

Chase's famous 5 h.p. Soncin pacing machine has been sold to an Anerley amateur pace follower. The machine with its red single-cylinder Soncin engine has made frequent appearance on the Palace track during the past five years. It is said to be still good for a mile a minute.

Newcastle and District M.C.C.

Members are reminded to keep to-day (March 18th) vacant for the annual general meeting, which all are expected to attend. Members please refer to Rules 22-30, 32, and 33.

Dundee and District M.C.C.

The annual general meeting of the above club will be held in Mather's Hotel, Dundee, on the 25th inst., at 7.30 p.m. Business—appointing of office bearers, arranging programme for the year, etc. All interested are cordially invited.

Lincolnshire M.C.C. (Scunthorpe Centre).

The above club will hold a hill-climbing competition on April 8th and 11th at Trafford Hill. There will be classes for lightweights, medium ditto, and twins. On April 11th the same club will organise a reliability trial.

Bolton and District M.C.C.

At the annual general meeting of the above-named club it was unanimously decided to affiliate to the Auto Cycle Union. The hon. sec. is Mr. Arthur Richards, "Sunny View," High Street, Bolton, who will be pleased to give every information to intending members.

Essex M.C.

The opening run is to Witham on the 5th prox. Other important fixtures are as follows: May 9th, hill-climb; May 17th, speed judgment test; May 31st, non-stop run to Clacton; July 4th, 200 miles non-stop for motor bicycles; July 11th, gymkhana; August 8th, annual race meeting on the Stadium track, Shepherd's Bush; August 15th, twenty-four hours ride.

A Club Formed at Earl Shilton (Leicestershire).

A motor cycle club has been formed for Earl Shilton and district, under the title of the Earl Shilton and District Motor Cycle Club. Mr. A. T. Peacock was elected president and Mr. L. M. P. Ney, Earl Shilton, hon. secretary and treasurer. Earl Shilton is comparatively a small but growing town, with a population of about 4,000, and, considering there are already ten motor cyclists in the place, it speaks well for the popularity of the sport.

Harlesdon Cycling and Motor Cycling Club.

The Harlesdon Cycling Club has now changed its name to the Harlesdon Cycling and Motor Cycling Club, and local motor cyclists not already members are invited to join. A long list of club runs has been arranged, including a speed-judging competition. The annual subscription is 10s. 6d., with an entrance fee of 2s. 6d. The next run is on the 22nd inst. to Cobham, starting from the Harlesdon Public Library at 9.30 a.m., and on the 29th inst. to St. Albans. All motor cyclists are invited. The joint hon. sec., Mr. E. Ward Bishop, 25, Bolton Road, Harlesdon, N.W., will furnish particulars of membership.

Motor Cycle Union of Ireland (Dublin Centre).

The opening run was to be held yesterday (Tuesday) to Bray. The first hill-climbing competition is arranged to take place on Saturday, April 25th, 1908. Speed trials at Portmarnock will take place on Saturday, May 30th, July 11th, August 22nd, and October 10th, and a sub-committee has been appointed to make arrangements for the laying of boards, if possible, or in some other way to facilitate the wheeling of the motor cycles down on to the hard sand. Medals will be presented as prizes this year.

An ordinary general meeting of the club will be held at Wynne's Hotel, Abbey Street, on Monday, March 23rd, at 8 p.m.

The president (Mr. J. B. Dunlop) has kindly presented a cup for competition during the season, for which the committee take this opportunity of publicly thanking him.

Cardiff M.C.

On Monday evening of last week, Mr. J. W. G. Brooker read a paper before members of the above club on "Lubrication." His paper dealt with the theory of lubrication, solid friction and fluid friction, the evolutions of methods of lubrication, and carbon deposit. The paper was much appreciated, and several interesting problems were introduced.

Southern M.C.

At a committee meeting held on Wednesday last, the 11th inst., it was decided to hold the annual general meeting on Wednesday next, the 25th inst. Further details will be sent to members in due course. Several new members were elected, and the balance-sheet and accounts were discussed.

Birmingham M.C.C.

On Saturday next the run is to Leamington. The annual meeting is fixed for the 28th inst., and all members are requested to attend. On the following day there is a run to Evesham. Meet King's Heath tram terminus, 10.45 a.m.

Coventry M.C.

The annual general meeting is to be held this evening (Wednesday) at eight o'clock, at the Craven Arms Hotel. On Saturday the opening run takes place. Members will meet at four o'clock at the Unicorn Hotel, Stratford-on-Avon, for a photograph, and tea will be taken at the Bath Hotel, Leamington, at 5.30 p.m. A simple but novel form of competition will be held in connection with the run from Stratford to Leamington, particulars of which will be given to members at the start.

Bradford M.C.C.

The above club's balance-sheet for the year ending December 31st, 1907, shows an amount of £13 9s. 8d. in hand after payment of all liabilities. The officials intend to pursue a vigorous programme during the present year, says our local correspondent, the following list of events having been arranged: (1) Bradford to Edinburgh, 400 miles in 24 hours for Triumph Cup; (2) 200 miles reliability N.S.U. Cup; (3) Dyson Shield for hill-climb; (4) Merrall's Cup, sunrise to sunset competition; (5) speed judging competition; (6) minor hill-climb; (7) combined competition; (8) fast and slow hill-climb; (9) circular route (absolutely non-stop run).

It is satisfactory to note that the membership is approaching the century.

Western District M.C. (London).

A most successful competition and opening run was held by the above club on Saturday last, the 14th inst. The event took the form of a paperchase through the lanes which abound in the neighbourhood of the Bath Road. The club was favoured with a fine day, and after a most enjoyable run of about an hour the hares were overtaken by the sports secretary at Uxbridge. There was a record attendance of members, and it is hoped that the monthly competitions which the club intends holding will lead to many new members joining and to an increased attendance at the runs. The following was the result of paperchase: 1st, C. N. Gould (3½ h.p. W. and P.); 2nd, H. W. Beach (5 h.p. Vindec); 3rd, W. J. Barratt (3 h.p. Fafnir).

Lincolnshire M.C.C.

A very well attended meeting of the committee was held at Lincoln on Saturday last when representatives attended from Gainsborough, Grantham, Barrowby, Sleaford, Scunthorpe, and Louth. Thirty-one new members were elected, twenty-one being sent in from the Scunthorpe Centre of the club, which is going well. It was decided that "this club regrets its inability to assist the Motor Union petition as to taxation, the principle of singling out a class of road users

Club News.—

for the maintenance of the roads being considered to be wrong." The resolution of the R.A.C. that "there is no justification for any additional taxation on motors" was endorsed, and each member of Parliament in the county and district covered by the Lincolnshire Club is being written to, the motor cyclists' case being presented. The agenda for the council meeting of the A.C.U. on Saturday next was discussed, and the ten delegates informed of the wishes of the club. It was decided to hold the opening hill-climb at Waddington on Easter Monday afternoon, and a special committee was elected to deal with the detail work. After a long discussion, it was unanimously decided to have only one course for the reliability trial on Whit-Monday to consist of a circular run of 140 miles in the county. It was reported by the secretary that a good centre had been formed at Louth, with Mr. Cusworth as chairman, and Mr. W. J. Clarke as secretary. The question of an inclusive policy for insurance was discussed. Mr. Brooke, the chairman of the Scunthorpe Centre, offered a cup for a team trial between the various centres. Mr. Foster, the chairman of the Lincolnshire M.C.C., announced his intention of offering a trophy, and Mr. Brunning, a vice-chairman, offered a prize. It was decided to have a long distance trial; the course suggested is Lincoln to Yarmouth and back. The membership is now 246.

Dublin and District M.C.C.

The opening run of the above club was fixed for yesterday (the 17th inst.), when it was arranged to meet the Dublin Centre of the M.C.U.I. at the Royal Hotel, Bray, Co. Wicklow, at 3 p.m. The year's programme will include a reliability trial, hill-climbing competition, speed and consumption trials.

The following is a list of officers elected at the recent general meeting: President, Dr. Reginald White; vice-presidents, C. B. Franklin and P. S. Sheardown; hon. secretary, Mr. M. J. Chambers, 15, Edenvale Road, Ranelagh, Co. Dublin; hon. treasurer, Mr. Henry Molloy, 8, Sandford Avenue, Donnybrook, Co. Dublin; committee, the hon. secretary, the hon. treasurer, Jas. Browne, Thos. W. Collins, F. J. Walker, Wm. H. Mowlds, Wm. Molloy, and H. McAdoo.

Cambridgeshire M.C.C.

The above club was successfully formed on Wednesday evening last at Ye Olde Castle Hotel, Cambridge. The chairman was Councillor F. Morley, who presided over a representative meeting, and explained the advantages of the club, which he said was being organised for the purpose of holding competitions, club runs, and social intercourse. There was some discussion on the similarity of the initials for badge purposes of this and the University Club, but it was finally decided to call the club the Cambridgeshire Motor Cycle Club, the subscription is fixed at 7s. 6d. The hon. secretary is Mr. C. W. Wilson, 38, Victoria Park, Chesterton, Cambridge, who will be glad to receive names of motor cyclists wishing to join the club. Mr. Wilson is kind enough to mention that the article recently published in *The Motor Cycle*, "How to Form a Motor Cycle Club," by J. H. Hall, was of very great assistance in organising the meeting.

Motor Cycle Union of Ireland (Ulster Centre).

The A.G.M. was held in the Grand Central Hotel, Belfast, on Thursday last, the 12th inst., Mr. R. Graham Lindsay occupying the chair. There was a very good attendance.

The Secretary (E. B. Waring) read the annual report, which gave a summary of the work done during 1907, including the various competitions and names of winners. The membership showed a very satisfactory increase, thirty-five names having been added during the year, the total number on the roll to date being 102.

The Treasurer's statement was also of a gratifying nature, the total receipts being far in advance of the previous year and the balance in the bank considerably larger.

Both reports were unanimously adopted.

Special reference was made to the agreement with the Irish Cyclists' Association regarding motor-paced races, also to the recent speed limit inquiry, and the valuable assistance rendered by Mr. Rees Jeffreys in connection with the latter.

Correspondence from the Motor Union and the Royal Automobile Club with reference to affiliation was referred to the committee for their consideration and report at a subsequent meeting, as was also a communication from the Motor Union dealing with the question of taxation of motor vehicles.

The election of officers resulted as follows: President, the Marquis de Mouzilly St. Mars; vice-presidents, Messrs. H. C. Craig, W. C. Mitchell, T. Macgregor Greer, H. Berrington, Thomas Greer, and Dr. Sidney Brice-Smyth; committee, Messrs. H. G. Ferguson, T. H. Dunlop, T. Moles, T. Dickson, G. Kirkpatrick, W. Wilson, J. J. Kennedy, R. G. Lindsay, T. Denby, J. L. Williams, T. Ireland, J. A. M'Kee, and A. W. Hamilton. Mr. J. S. Garrett was re-elected hon. sec. and Mr. J. Holden was elected hon. treasurer. Mr. P. S. Bray was re-elected hon. solicitor, and a vote of thanks was accorded him for his valuable services during the year, more especially in connection with the speed limit inquiry. Messrs. T. A. Clapham and J. Stewart were elected auditors. The following new members were elected: Messrs. C. B. Hurst, S. Johnston M'Dowell, Thos. T. Maclean, F. H. Maclean, C. E. Murphy, and Jas. Kane.

The Chairman intimated his intention of presenting prizes for a special reliability run during the year, and a vote of thanks was unanimously passed to him.

THE A.C.U. COUNCIL MEETING.

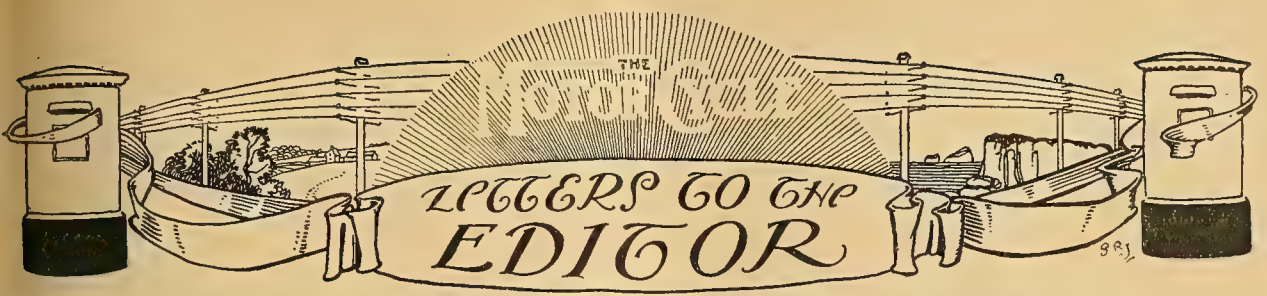
We have received a lengthy letter from Mr. G. J. Wilkinson, the hon. secretary of the Lincolnshire Motor Cycle Club. The letter is to urge club delegates and representatives of private members of the A.C.U. to support the proposals standing in Mr. Wilkinson's name for the A.C.U. council meeting on Saturday next. We regret we have not sufficient space to publish the whole of the letter, but doubtless all club delegates and representatives of private members will read the proposals in the agenda paper which will be circulated by the secretary of the A.C.U. Mr. Wilkinson is strongly in favour of dividing the country into centres on the lines of the N.C.U., and thinks it would be quite possible for this to be done before the end of 1908. With regard to the payment of delegates' railway fares, Mr. Wilkinson rightly points out that the provinces remain practically unrepresented, partly because of the expense in attending the meetings, which are always held in London. He therefore has so worded his proposal that expenses be paid when the meeting is held over thirty miles from the delegate's residence. Mr. Wilkinson concludes by hoping that the delegates and representatives will work together and assist the committee of the A.C.U. to place the Union on an ideal basis.

The business of Messrs. H. Collier and Sons, Herbert Road, Plumstead, has been formed into a limited liability company with the title of H. Collier Ltd., and in future the Matchless motor cycles will be made in new works, May Place, Plumstead, in addition to the old premises.

A NOVEL COMPETITION.

Our contemporary *Photography* announces a radical departure in competitions which ought to commend itself to all users of the camera. The idea is capable of considerable development. In the current issue of the journal is published a picture for which its readers are asked to provide a title. This title must be sent to the Editor on a coupon which is issued with the paper, together with a postal order for 6d. and the most appropriate title will receive one-third of the total prize money, which the publishers of the paper guarantee shall amount to at least £15, so that here is a chance of getting £5 as a minimum for the best title. Consolation prizes of approximately £1 each will be distributed; thus the whole of the money sent in will be returned to successful competitors. The titles for this picture must be sent on the coupon issued in the current issue of *Photography*, and must reach the publishers, 20, Tudor Street, E.C., not later than March 24th.

Handle-bar control has so much to recommend it that it is not surprising to find it steadily gaining in favour among motor cyclists. Only those who have given a trial to some efficient system of this kind—such as that supplied by the E. M. Bowden's Patents Syndicate, Ltd., for instance—can fully appreciate the comfort and sense of security it gives to the motor cyclist, and they who have once given handle-bar control a fair trial are rarely found to revert to any other system.



The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Outside Flywheels.

[3177.]—Might I venture a few remarks *re* outside flywheels? In my own experience they have one serious drawback, and that is, if by any chance the engine backfires, some damage is bound to occur sooner or later. I started my favourite pastime on a Calvert machine, which had a large heavy outside flywheel. Once I had the crankshaft bent, also connecting rod, and lastly I broke the boss off the flywheel, all through backfires.

With inside flywheels no such damage can occur, as there is not the twisting movement brought into play as in the case of an outside flywheel, and I think that this fact alone renders the inside flywheel type more mechanically correct.

T. F. COX.

Silence.

[3178.]—I am greatly honoured by such an expert on silencers as Mr. Aldington condescending to criticise my poor little silencer. Perhaps I may be allowed to point out that not for a moment did I intend the size of the silencer nor the number of holes in either pipe to be a fixed and unalterable quantity. The engine for which I made the original silencer is a 74 × 76 mm. De Dion Bouton, and, naturally, for an ordinary 3½ h.p. engine about 85 mm. bore I should greatly increase the number of holes in the central pipe, and possibly enlarge them to ⅜in. with a corresponding increase in number, though not, I think, in size of the holes in the outer shell. As for Mr. Aldington's scornful remark about this being the result of two years' thinking out, may I inform him that I have only made two silencers in that time; I am, in fact, far too busy in matters other than motor matters to give more than a little time to these problems at the ordinary holiday times. The De Dion engines, as Mr. Aldington will remember, have abnormally small exhaust pipes. Mine is only ¾in. outside diameter, but I question whether anyone has ever made a De Dion engine any better by increasing the size of the pipe. This matter is frequently referred to in the columns of the motor papers, and that opinion is, I think, almost universally held.

G. D. MONICE.

Military Motor Cycling.

[3179.]—Whilst thanking you for the hospitality you extended to me in your columns last year, I again beg you to repeat the courtesy. Last year, by means of a letter published in your columns, we were enabled to fill all the vacancies we had for motor cyclists, and were obliged to disappoint some candidates for membership. Under our new organisation, which comes into force on April 1st, we shall have vacancies for fifteen or more motor cyclists.

There are two points to which I wish to draw the attention of your readers:

(1.) That any man who joins us before March 31st need only engage to serve in the Territorial Army for one year, whilst anyone who joins after that date (unless he is already a member of a volunteer corps) will have to engage for four years.

(2.) That out of the dozen readers of *The Motor Cycle* who joined us last year under the then existing volunteer regulations, every single one has found motor volunteering so attractive that he has decided to re-engage with us under the Territorial Army regulations. This, I think, is in itself the best testimonial possible.

I may add that this cyclist regiment will be the only one formed in the vicinity of London, and that it consists entirely of cyclists and motor cyclists, and has an establishment of 21 officers and 532 men.

Any further information I can give your readers is at your service; also, intending recruits should apply at the headquarters of the London Cyclist Regiment, 45a, Horseferry Road, Westminster, S.W., any Tuesday or Thursday evening between the hours of 7 and 9, and ask for yours faithfully,

ALBERT H. TRAPMANN,
Captain and Acting Adjutant.

The Motor Union and Taxation.

[3180.]—There seems to be some misapprehension as to the attitude of the Motor Union in the matter of taxation of motor cycles. It arises partly from the fact that more publicity has been given to the conversation which took place between the Chancellor of the Exchequer and the chairman of the Union than to the memorandum handed in to the Chancellor, which embodied the considered proposals of the Union, and formed the basis of the conversation. These misapprehensions may be removed by showing the Union's taxation proposals in a comparative form. They are set out in the following table, side by side with the present scale of taxation and the scale proposed by the Royal Commission:

Vehicle.	Present taxation.	Taxation proposed by—Royal Commission.	Taxation proposed by—Motor Union.
	£ s. d.	£ s. d.	£ s. d.
Motor bicycles weighing less than 2 cwts.	0 15 0	1 0 0	0 7 6
Motor cycles weighing 2 cwts. and less than 7 cwts. ...	0 15 0	1 0 0	0 15 0
Motor cars up to 12 cwts. unladen	2 2 0	2 2 0	1 10 0
Motor cars exceeding 12 cwts. and up to 15 cwts. ...	2 2 0	3 3 0	2 0 0
Motor cars exceeding 15 cwts. and up to 20 cwts. ...	2 2 0	5 5 0	3 0 0
Motor cars exceeding 20 cwts. and up to 25 cwts. ...	4 4 0	5 5 0	4 0 0
Motor cars exceeding 25 cwts. and above (commercial vehicles excepted)	4 4 0	8 8 0	*6 0 0

*£6 up to 30 cwts. and £2 for every additional 5 cwts.

An examination of this table will show that the Motor Union asks for a reduction upon the taxes paid by the users of small-powered motor vehicles.

The Union also strongly supported the recommendation of the Royal Commission that the proceeds of taxation should be devoted to the roads.

There are two ways of opposing obnoxious proposals, viz., fierce denunciation, or by formulating a reasonable alternative scheme. Fierce denunciation wins a passing popularity, but it gains for those who indulge in it the fatal reputation of being entirely impracticable enthusiasts. The very great influence which the Motor Union possesses with public authorities is due to their appreciation of the fact that the Union is a thoroughly practical body with whom they can deal.

It must be left to motorists to say whether a reasonable proposal put forward in a conciliatory manner will not be more likely to receive attention from the Chancellor of the Exchequer than threats of opposition.

W. REES JEFFREYS, Secretary.

The Future of Motor Cycling.

[3181.]—In the discussion which followed the reading of this paper, I see Mr. M. J. Tuchmann remarked that there is not, so far as he knows, an efficiently sprung machine so far as the back is concerned. Has he tried the Rex cantilever seat as fitted to that company's models? If not, he need go no further before knowing of, at all events, one satisfactory machine, and I feel sure that one short ride would convince him.

He also says that spring forks leave a good deal to be desired. Some certainly do. One may wish for a good deal more "spring" in some, and a good deal less in others. However, again let me draw attention to the Rex machine and ask Mr. Tuchmann what more he desires. From a practical point of view I consider the Rex spring fork to be all that is necessary, and quite the best I have ever seen. It does not increase any tendency to "skidding."

I may add that I have no axe to grind; in fact, I am in no way interested in any firm of motor cycle makers or traders, but I am a well-satisfied and perfectly comfortable rider—up to 400 miles per day—of Rex motor cycles, and I never wish for anything better sprung or more efficient generally than my new mount. FRED C. BAGSHAW.

[3182.]—I note that during the discussion which followed the reading of Mr. Bell's paper, "The Future of Motor Cycling," it was observed by one speaker that "An efficiently sprung machine, as far as the back was concerned, had not yet appeared on the market."

This statement is erroneous. The Bat is so sprung, and the result is a complete success; even the footboards being suspended along with the saddle pillar, etc. The rider is admirably protected. Anyone testing the difference between a machine sprung on Bat lines and the ordinary motor cycle will recognise the sterling value of the device fitted to the Penge Co.'s two-wheeler. My last spin on a modern rigid frame machine showed me that the latter is no longer satisfactory for the tourist, to whom both pace and comfort are essential. The shaking was altogether too pronounced.

It is only just that mention should be made of the excellence of design of the Bat machine, which, in so very important a matter, has given all its rivals a lead. It is important also to note that the strength of the main frame of this motor cycle is in no way sacrificed to comfort. My weight is about fourteen stones, and I show no mercy in the matter of driving the "twin" engine for all it is worth. My conviction is that the combination of strength and comfort is well nigh perfect. No more rigid frame productions for me! I would not now ride the ordinary motor cycle, and more especially the light one, on bad roads, for touring becomes then a misery rather than a sport.

Given a good engine, especially a "twin," the rider has never to complain of vibration from this source. The road shocks are the only causes of any discomfort which he may experience. Travelling slowly, the motor cycle is far more comfortable than any push bicycle that ever was designed. But the speed at which we travel tends to make the inequalities of the road sharply felt. The Bat spring suspension, which includes that important detail, suspended footboards, goes far to meet the difficulty, and assuredly marks a splendid advance. It is simple and satisfactory in every way. The claim that this machine is the "Pullman car of motor cycling" seems to me thoroughly justified.

The abolition of those absurd survivals, pedals, and their replacement by footboards, insulated from road shocks, will be appreciated by all riders whose ideas are not dominated by memories of the discarded push bicycle.

Switzerland. E. DOUGLAS FAWCETT.

How to Prevent Punctures.

[3183.]—I have read your valuable paper for the last four years, and I find in all the recent trials that punctures have been the chief cause of stoppage. Yet strange to say, how few try to find a remedy to prevent them. Of my five years' of motor cycling I have never had a puncture in the front wheel, but I have had my share in the back wheel, and they have always been caused by either wire or nails. Now the front wheel treads upon a nail or some sharp wire, but it does not penetrate the front tyre; it tilts upon its end, and the back wheel coming on in quick succession treads upon the nail whilst it is in its vertical position, with the result that the tyre is punctured. I do not think any puncture-proof band will prevent a nail piercing the tyre in such a case, unless it is made of a material equally as strong as the nail. (How would a finely woven mat of wire do to be woven in with the tyre?)

My own preventive last year has proved highly successful, and I have not had any punctures since I adopted it. I have fitted a large leather flap to the front mudguard extending to about ¼in. from the ground, so if the front wheel tilts any sharp metal up upon its end, the flap knocks it over before the back wheel comes upon it. One objection to the flap is its close proximity to the ground, causing a lot of dust. To remedy that a chain could be fitted to hang immediately in front of the back wheel. In addition, I have always had a wire fixed across the tyres, which is a fairly good preventive. I propose to say a few words regarding tyres with respect to the gear of a machine. My machine was fitted with a certain make of 2¼in. tyres. There is a certain hill in our district I could never climb without pedalling. Now I have fitted another make of tyre, and I can simply fly up, proving that tyres have a deal to do with hill-climbing, and have either reduced the gear or they are quicker and better tyres. Some tyres are thick, heavy, and dead, and are made of a mixture of composition and rubber, and quickly wear through to the canvas.

HAROLD T. ANDERSON.

Motor Cycling in Ceylon.

[3184.]—The enclosed photograph may be of interest as coming from the Colonies. The 2¾ h.p. Minerva shown has done three and a half years' hard service, and has never suffered from anything worse than a punctured tyre, and although it has done many thousands of miles over our very trying roads, it is running better now than when new. Overheating is quite unknown on this machine, thanks to the air scoops.

I also have a 4½ h.p. twin Minerva which has given entire satisfaction for the last two years, having only played up once, viz., when water was allowed to get into the petrol. The Eisemann magneto and distributer are foolproof and apparently indestructible. We have never had to ask for

expert advice concerning either machine, which is just as well, as experts here are few and far between.

Your paper is much appreciated here, being the only one from which we can learn anything.

L. M. W. WILKINS.

P.S.—I need hardly add I have no interest in Minerva Motors, Ltd.

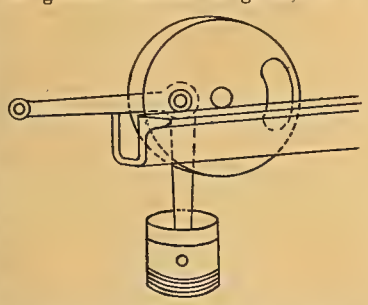
Non-skid Tyres.

[3185.]—I should like to endorse the remarks made by W. Dann [3151] with regard to the twin-tyred wheel and side slip. I have ridden on some atrociously bad roads here (North Wales) this winter. I must say I have not had a single side slip—in fact, I have not had the slightest fear or indication of one. T. E. GARRATT.

The Balancing of Petrol Engines.

[3186.]—"Shazbazzik" in his letter [3159] seems to forget at if the piston, gudgeon pin, and connecting rod small d of a petrol motor are exactly balanced by masses on e flywheels, the engine as a whole will be as much out of lance in the horizontal as it was before in the vertical ane. The general practice of locomotive and other engineers to balance about two-thirds only of the reciprocating parts revolving masses. Of course, in a single-cylinder motor cle the most suitable proportion is affected by the relative portance (from the rider's point of view) of vertical and rizontal vibrations, remembering always that it is impossible balance completely any reciprocating mass by a rotating e. Factors which have a considerable bearing on this matter e the strength, design, and elasticity of the frame; the sition and method of attachment of the engine; and the rangement of the saddle, footrests, and handle-bars with gard to the engine. In "Shazbazzik's" case the vibration as only noticed to be excessive when the sidecar was tached. I presume that the front cross tube of the sidecar is fixed close to the engine crank case.

The makers, in designing the balance weights, probably did t take into account the effect on sidecar footboards of the gine vibration; but with the increasing use of sidecar tachments the balance of many motor cycle engines will ve to be considered. No general rule can be given, but it seldom advisable to lance more than reequarters of the iprocating parts in motor cycle engine ving one vertical linder. In a twin chine with cylinders 90° (very few en- les are so made) a st excellent balance every direction is tained if the weights e just equal to lift- one piston and nnecting rod with the other connecting rod horizontal— e test being carried out on a lathe bed or a couple of iron rs levelled up with a spirit level. Most twins are made th the cylinders at 60°, in which case about one and two- rds of the weight of a piston and connecting rod little d and both big ends should be balanced.



Some little time ago I came across a twin of reputed make, e engine of which vibrated badly at high speeds. I found at the balance weights more than lifted both pistons and ds. As the machine was going to have new pistons fitted simply made these heavier than the old ones (as a matter fact the new castings were of a much heavier pattern). hen thus altered the machine ran beautifully at all speeds, e improvement being most marked. This case was, of urse, a fault in the opposite direction to that described in ter No. 3159, our engine being over-balanced.

OSPREY.

[3187.]—Having read "Shazbazzik's" letter on the ove subject, perhaps a few words on the same may not be t of place. It is obviously impossible to balance the ciprocating parts of a single-cylinder engine by revolving lance weights. If an attempt is made to do this an un- lanced couple is set up at right angles to the movement the reciprocating parts. This is very undesirable in a otor cycle, as the following incident will show. In a cer- in engine no attempt had been made to balance the piston connecting rods, and the vibration in a vertical direction as very bad. The engine was taken down and three ⅜in. les were drilled in each flywheel rim. This had the effect quite curing the vibration in the engine, but caused an cessive vibration in the front fork which resulted in a acture of the steering tube just above the fork crown, and e owner narrowly escaped a very severe accident. The gine was again taken down and one hole in each flywheel as plugged up, with the result that there is now a very ight vibration in a vertical direction, but none in the front rks.

The best that can be done with a single-cylinder engine to adopt a compromise between a perfect balance verti- lly and the same horizontally. This can be done approxi- ately by balancing the crank pin and the whole of the connecting rod, and leaving the piston to take care of itself

Of course, by using reciprocating balance weights, as is done in some of Yarrow's torpedo boat engines, a practically perfect balance may be obtained, but this is not practical on a motor cycle engine.

Perhaps such firms as the J.A.P., L.M.C., or the Triumph, would give us their views on this interesting subject.

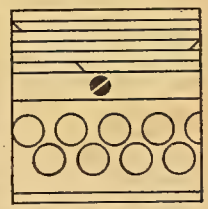
J. E. GREENWOOD.

[3188.]—Being designer at one of the leading motor firms, I would like to point out to your correspondent "Shazbazzik" [3159] that the only correct way to perfectly balance a reciprocating mass, such as the piston, gudgeon-pin, and a portion of the connecting rod, would be by another reciprocating mass of equal weight. A fair compromise is, however, effected by taking the weight of the crank pin, adding to this the weight of one-third of the lower length of the connecting rod, and considering the whole of this weight as revolving in a circle the diameter of which is equal to the piston stroke; this can then be accurately balanced by suitable weights in the flywheels.

I have noticed the vibration complained of by "Shazbazzik" in the Quadrant engine, but am inclined to think that this is more due to high compression than to incorrect balancing of parts. I have yet to see a single-cylinder petrol engine of 3½ h.p. and over which runs smoothly and without vibration at any speed above 2,000 r.p.m. The smoothest running engine I ever possessed was the bulky and heavy old 2¾ h.p. 80 by 80 M.M.C. as fitted to the good old Excelsior machines. The sweet running and flexibility of this engine were chiefly due to its very low compression. Of course this meant sacrificing a certain amount of power for hill-climbing.

J. T. CLARKE.

[3189.]—My experience agrees with that of "Shazbazzik." I have a 3½ h.p. engine which has been greatly improved by fitting a very light piston, and altering the balance weights so that the piston and counterweights balance each other. This has made the engine run much faster and with much less vibration at all speeds. Very heavy flywheels are fitted, which is an important point.



The piston is something of a novelty in this way. It is drilled with ⅜in. holes to assist lubrication, as shown in the sketch. Parts of the baffle plates are cut away from the top of the crank case, but no trouble is experienced with over-lubrication. This engine took me from Lyme Regis to Exeter recently without a touch of the pedals. Gear 4½ to 1, 80×85 engine, beating a 3½ h.p. Triumph. A glance at the "Contour Road Book" will show what the hills are like. (Coast road *viâ* Sidford.)

L. MOGRIDGE.

First Motor Cycle Race at Brooklands.

[3190.]—Referring to Mr. Wells's letter concerning the race at Brooklands Track between two private sportsmen, the conditions of this match were well known to Mr. Wells, who intended to be present but for the alteration of the original date.

Mr. McMinnies's machine was his own 3½ h.p. T.T. Triumph on which he made a non-stop run in the quarterly trials, and Mr. Bickford's a 5 h.p. T.T. Vindec Special 1907 model. Naturally both competitors left no stone unturned to get the fastest possible speed out of their machines, there being no restrictions whatever.

We are too busy to accept Mr. Wells's challenge, and it does not concern us whether or not a 5 h.p. Vindec Special can do over sixty miles per hour, and Mr. McMinnies's performance is quite sufficient to prove the speed that can be accomplished on a T.T.T.

F. HULBERT.

(Several letters are unavoidably held over.)

EXPERIENCES WANTED.

"J. A. V." (Cambridge) wishes for owners' experiences of the Riley 6 and 9 h.p. tricars.

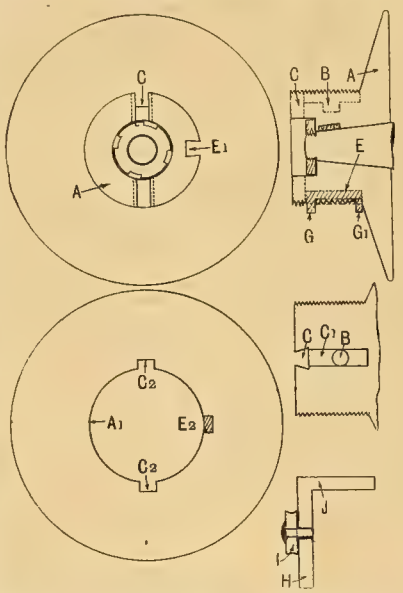
"S. T. R." (Hastings) would like readers' experiences with the latest type of Roc all speed gear, as exhibited at the Stanley Show in November last.

RECENT PATENTS

By ERIC W. WALFORD, F.C.I.P.A.

Another Variable Pulley.

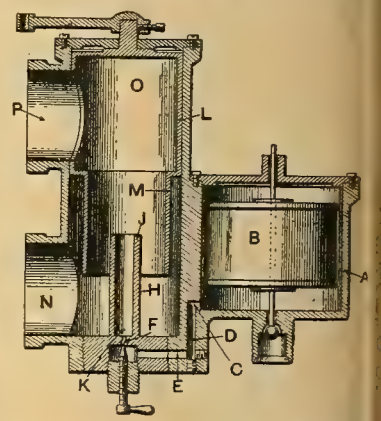
THE inventor of this pulley is Mr. T. W. Cairns, of 2, North Road, Birkenhead. Its principal merit appears to be in the fact that it can be adjusted while in use. In a screwed boss A a slot is cut across the threads and also across the face or end of the boss as at C, and a hole B is drilled in the bed of the slot to receive a spiral spring. Where the slot crosses the pulley face it is undercut. In this slot is placed a key, and this key has a radial or upward movement when pushed by a spring in the hole at B, but cannot move laterally by reason of the undercut slot C, the key being shaped to fit. Upon this screwed boss, which is chased with a left-hand thread, is screwed the loose flange A_1. This has one or more slots C_2 cut across its threads, and when one of these slots registers with the slots C and C_1, the key H J, pushed outwards by a spring, enters it. These slots in the loose flange are of sufficient depth to allow the key to enter for about half its depth, so that half the parallel part of the key is engaged with the loose flange and half with the fixed flange, thus locking them together and driving solid.



The means of pulling this moving key out of engagement with the loose flange independently of the rotation of the pulley are as follows: On the moving key H is mounted a small wheel on a stud I. It is so mounted that when the key H J is depressed below the screw-threads on the pulley boss the stud centre coincides with the shaft centre, but when the moving key is in engagement with a slot in the loose flange the stud centre does not now coincide with the shaft centre, but describes a small circle round it. To restrict the diameter of this circle and to bring the stud centre to the shaft or pulley centre, a lever is pivoted at one end and pulled or pushed at the other end; the central part of this lever being adapted to bear against the small wheel on the stud I, a part of each revolution of the pulley, or in other words the edge of the lever, cuts the aforesaid circular path described by the stud centre. As the diameter of the path is lessened the key is also drawn out of the slot in the loose flange, until at last the flange is free. Thus the flange may be locked and unlocked at will. As the loose flange under the influence or action of the belt would have a tendency to jam against the fixed flange or else to run itself off the boss, according to its direction of travel, travel limit stops are combined in the shape of the key E. Fixed in the loose flange is a key E_2, which projects at each side of the flange. When the flange screws, say, outwardly, the side of the key E_2 eventually comes into contact with one side of the key E at G, thus preventing its further travel in that direction. When the flange travels inwards, G_1 limits it in that direction. The key is fixed in a dovetail or undercut slot E_1, being shaped to fit the slot.

An American Carburetter.

THIS carburetter is the invention of Mr. P. Jenness, of Philadelphia, U.S.A. It will be seen that there are no automatically moving parts, the throttle being the only movable element. Nevertheless, it is claimed that perfect automatic action is obtained by virtue of the arrangement and relative dimensions of the petrol passage. The carburetter is provided with the float-feed chamber A having the float B therein. C designates a port in the lower portion of the float-feed chamber, through which liquid hydrocarbon flows through the passages D and E to the port F, and thence into the nozzle H, the internal diameter J of which depends upon the size of the admission port F.



The lower end of the bore J terminates in a plane extending perpendicular to the longitudinal axis of the nozzle H, as indicated at K, since such a construction gives in practice the desired reduction in pressure at the lower end of the nozzle H, in proximity to the port F. The throttle drum L has a reduced end M, into which the nozzle H extends, said reduced end forming the strangle tube. N designates the air inlet of constant area, and O the commingling chamber for the air and liquid hydrocarbon, which latter in their commingled state pass through the outlet P. The loss of head due to the impact of the liquid passing at high velocity through port F against the liquid in the nozzle H, the velocity in which is always less than in port F, increases as the velocity increases, thus lowering the co-efficient of discharge as will be clearly understood by those skilled in this art, and the amount of liquid hydrocarbon has the same relative proportion to the air for all speeds of the engine, thus producing a substantially constant explosive mixture at varying speeds. The inventor states that he has found as the result of numerous experiments that by employing a construction such as is illustrated in the drawings, the desired results may be attained It is, however, essential that in all cases the admission port be smaller than the discharge end of the nozzle.

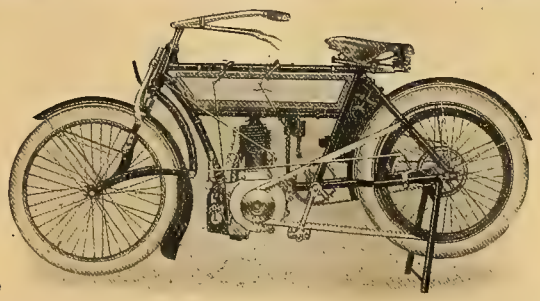
Messrs. L. Ripault and Co., 64a, Poland Street, W., agents for the K D lightweight motor bicycle, have organised a novel competition. The "entrance fee" consists in the competitor trying a half-crown mouth siren, and stating why he considers he should be awarded a K.D. motor bicycle for nothing. Our well-known contributor, Mr. B. H. Davies, has consented to act as judge, and on his decision the machine will be awarded to the competitor who gives the most satisfactory reply. The K.D. motor bicycle may be seen at the company's showrooms

The Metropolitan Machinists' Co., 75, Bishopsgate Street Without, have sent us a copy of their 1908 catalogue. This firm make specialities of two types of motor bicycles: The 1½ h.p. Featherweight, fitted with an engine which possesses an outside flywheel, total weight only 60 lbs., and a medium power machine of 3½ h.p., bore and stroke 80×80 mm., fitted with gear driven magneto and spring forks. The machine is well designed and substantially built. The firm in question also make a point of stocking a full range of accessories including belts, chain belts, accumulators, coils, lamps, and almost every known motor cycle accessory.

VINDEC · SPECIAL

THE · MOTOR · CYCLE · OF · MERIT.

S.B.T. Co LTD



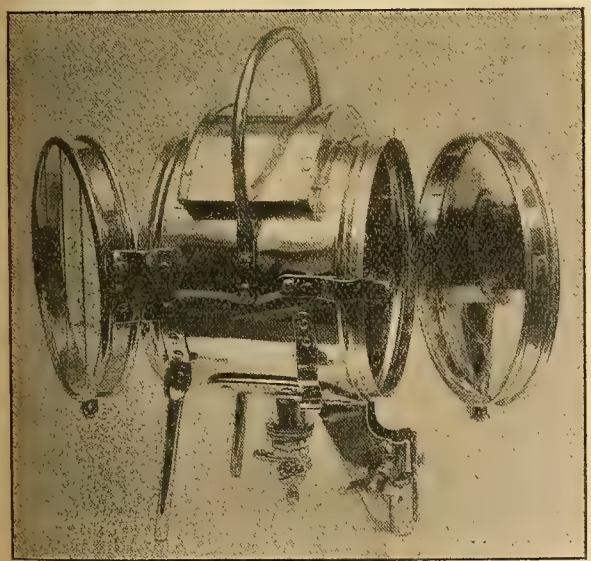
Model H, single cylinder, 3½ h.p., with "Vindec" Two-speed Gear, makes an ideal combination for the discriminating buyer who wants solid comfort combined with absolute reliability. It will take you anywhere—can be started without the least difficulty in the middle of a steep hill—and is a worthy companion to the twin-cylinder "Vindec," which is acknowledged to be one of the best motor cycles in existence.

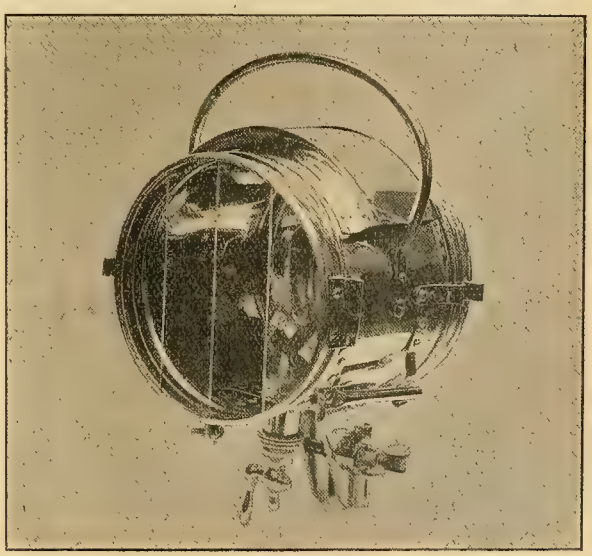
Our profusely illustrated "Book of the Vindec Special" is interesting reading—sent free upon receipt of request.

ORDER AT ONCE TO SECURE DELIVERY BEFORE EASTER.

SOUTH BRITISH TRADING Co LTD

13 & 15 WILSON ST, FINSBURY. LONDON. E.C.





We shall shortly place on market an automatic six-hour Generator.

Gas refining chamber, movable burner to stop glare in traffic, folding legs, top handle.

Weight 2¼ lbs., length 5 inches, diameter of lens 5 inches, power 1500 candle, direct beam 250 feet, light extends 450 feet, shadows thrown at 500 feet, small newspaper print read at 400 feet.

FITTED WITH

PATENT LEVERAGE BRACKET

which absorbs most of weight and so saves any likelihood of breaking bracket of cycle.

F.R.S.

PLATED OR BRASS

25/-

This lamp is also made in a larger size, very powerful, 32/-, for tricars and small cars of 15 h.p.

To introduce to riders who have not taken interest in this question of lamps we are offering a free trial of three days on receipt of P.O. for amount, payable to F. Swinburne. Dealers' terms on receipt of enquiry.

No soldering, but riveted and brazed throughout.

12, Clyde St., S. HALL & SONS, LTD., EDINBURGH.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—1d. per word, minimum 1s. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, on the Friday morning, or if sent to London, by the Thursday afternoon previous to the date of publication.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at *The Motor Cycle* Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed "No. 000, c/o *The Motor Cycle*, Coventry," or if "London" is added to the address, then to the number given, c/o *The Motor Cycle*, 20, Tudor St., E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with *The Motor Cycle*, both parties are advised of this receipt, and upon intimation of the arrival and acceptance of the goods, the money is forwarded less a charge of 1s. for registration. The time allowed for a decision after receipt of the goods is three days. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR BICYCLES FOR SALE.

HALIFAX Motor Exchange. — As the largest dealers in Rex machines, we have a few 1907 shop-soiled machines at clearance prices. Great bargains. Exchanges in all 1908 Rex and N.S.U. models.

HALIFAX.—1908 2¾ h.p. Peugeot, light, low, Bat frame, brand new; £21; cannot repeat.

HALIFAX. — 1907 35 guinea twin Rex, spring forks, soiled; £23; you save £13 15s.; we gain your confidence.

HALIFAX.—1907 magneto twin Rex, unridden, November price, £42, our price £28 10s.; another £13 10s. saved.

HALIFAX.—Shop-soiled 1907 black and gold Rex de Luxe, twin tyre, magneto, Roc clutch; 1908 price £55 13s., our price £35; you save £20 13s. Only a Rex agent can do it.

HALIFAX. — 1908 Rex de Luxe, Roc clutch, two-speed gear, magneto; 55 guineas; liberal exchange.

HALIFAX. — 1908 Rex featherweight, magneto, magnificent hill-climber, recommended; 25 guineas.

HALIFAX.—1908 3½ h.p. N.S.U., magneto, just delivered; £40; allow £25 for last year's model.

HALIFAX.—1908 5½ h.p. twin N.S.U., magneto; £52; allow £25 for 1907 single magneto, in good condition.

HALIFAX Motor Exchange. — Extended payments, exchanges; high-class machines purchased for spot cash. — 16, Westgate, Halifax. Telephone, 766. Telegrams, Perfection.

MOTOR BICYCLES FOR SALE.

HALIFAX Motor Exchange. — All machines are despatched in running order, with charged and guaranteed accumulators.

HALIFAX. — Very fine light low Rex, spring forks, Longuemare, in very good order; £12 17s. 6d.

HALIFAX.—4 h.p. twin-cylinder Werner, 26 by 2¼ Michelins, very smart mount; £18.

HALIFAX.—Fine 3½ h.p. Rex, spray, adjustable pulley, very smart and good; £11 10s., tyres excellent.

HALIFAX.—3 h.p. Rover, 26 by 2¼in. Palmers, front rim and Bowden rear brakes, Brooks B100; £13 10s.

HALIFAX.—3½ h.p. Rex, spring forks, vertical engine, spray, 26in. wheels, special finish; £12 10s.

HALIFAX. — 2 h.p. Minerva, 21 frame, 26 by 2 tyres, good little jigger; £8 10s.

HALIFAX.—Special light low 1905 Rex, 3½ h.p., Rex spring forks; £13.

HALIFAX.—Fine 3½ h.p. Rex, 50 guinea model, spray carburetter, good order; £11 10s.

HALIFAX. — 2 h.p. Humber, spray, special tank, tyres good, well attended to; £9.

HALIFAX.—3 h.p. Lloyds, vertical engine, Chater-Lea, long bars, low seat, 2¼ Palmers; £14 10s.

HALIFAX.—3½ h.p. Clarendon, vertical engine, footboards, ball bearings to engineshaft, 100 miles non-stop; £13 10s.

HALIFAX.—3 h.p. M.M.C., vertical engine, trembler coil, goes like a chronometer, fine Palmers; £13.

HALIFAX. — 3½ h.p. Rex, 22in. frame, vertical engine, trembler, good order; snap this; £11 10s.

HALIFAX.—2 h.p. Minerva, mechanical valves, spray carburetter, magnificent climber; only wants seeing; £8 10s.

HALIFAX. — 2¾ h.p. Minerva, spray, accumulator ignition, very efficient mount; £14 10s.

HALIFAX. — 3 h.p. Hobart, vertical, spray carburetter, trembler coil, splendid condition; £14.

HALIFAX.—1907 twin Rex, shop-soiled, and unridden, 2¼ tyres, fully guaranteed; £23; don't delay.

HALIFAX.—2¾ h.p. Antoine, spray carburetter, trembler coil, tyres good; bargain, £10 10s.

HALIFAX.—6 h.p. twin Rex, cantilever seat, non-skids to back wheels; £22 10s., or £11 and 3¼ h.p. Rex, surface.

HALIFAX. — 2½ h.p. Coventry Eagle, Buchet engine, vertical, spray, tyres, enamel, and plating excellent; £12.

HALIFAX. — 2¾ h.p. Antoine, spray, trembler coil, accumulator ignition, girder forks; only £9 10s.

HALIFAX.—2¾ h.p. Minerva, mechanical valves, 26 wheels, 2¼ tyres, perfect order and condition; £14 10s.

HALIFAX.—£2 deposit and six monthly payments of 27s. 6d. secures 2¾ h.p. Antoine, 2¾ h.p. Humber, 3 h.p. Hobart, 3 h.p. Lloyds, 2¾ h.p. Minerva, 2½ h.p. Buchet, 3½ h.p. Rex; all guaranteed running order.

HALIFAX Motor Exchange.—Unrivalled offer. In going order. 20s. deposit and six monthly payments of 22s. 6d. secures 1¾ h.p. Quadrant, 1¾ h.p. Minerva, 2 h.p. Minerva (mechanical valves, spray), 2½ h.p. magneto Singer, and 2 h.p. magneto Simms.

HALIFAX Motor Exchange. — Cash, exchange, or extended payments. High-grade machines purchased for spot cash.—16, Westgate, Halifax. Telephone 766. Telegrams, Perfection.

MOTOR BICYCLES FOR SALE.

REPLIES to every advertisement on this column must be addressed to Booth's Motor Exchange, Wade Street, Halifax.

MINERVA, 3½ h.p., 1907, spring forks, 2¼in. tyres, shop-soiled only; £25 10s.

QUADRANT, 3½ h.p., 1907, nearly new, 2¼in. tyres, spring forks; £25 10s.—Booth.

QUADRANT, new 1908 model, magneto; liberal allowance for your old machine.—Booth.

FOUR-CYLINDER F.N., magneto; £26 10s.; new lightweight F.N.; cash or exchange.—Booth.

TRIUMPH, 3½ h.p., 1907 model, like new, £35; Vindec twin, magneto, £35.—Booth.

REX de Luxe, black finish, magneto, Roc clutch, twin tyres; £28 10s.—Booth.

REX Twin, spring forks, black finish, specially built for sidecar; £22.—Booth.

MINERVA, 3½ h.p., smart machine, low built, £16 16s.; Fairy, 2¾ h.p., £20.

ANTOINE Twin, 6 h.p., low built, non-skid, nearly new; £22.—Booth.

G.B. Twin, magneto, spring forks, 2¼in. tyres, a beauty, long and low; £26 10s.

ROVER, 3½ h.p., free engine, spring forks, 26in. wheels, smart looking; £12 12s.

CLYDE, 3 h.p., vertical engine, magneto, £12 12s.; 3½ h.p. Excelsior, £10 10s.—Booth.

N.S.U., 3½ h.p., magneto, low built, £22 10s.; twin N.S.U., magneto, £28 10s.—Booth

STEVENS, 4 h.p., low built, long bars, most reliable; £16 16s.; Bat pattern.

CHATER-LEA, 3½ h.p., low built, 26in. wheels, smart; £12 12s.; reliable.—Booth.

KERRY Twin, long and low, £22 10s.; Kerry, 2¾ h.p., low built, £12 12s.

MAGNETO Rex, 3½ h.p., 1906 model, variable speed pulley, little used; £18 18s.

CLEMENT-GARRARD Twin, spring forks, 2¼in. Palmers, two-speed gear, smart; £18 18s.

ARIEL, 3 h.p., low built, vertical engine, £11 10s.; 2½ h.p. Minerva, £9 15s.

LIGHTWEIGHTS, 1¾ h.p., Clement-Garrard, £6 15s.; 1¾ h.p. Minerva, £5 10s. Cycles taken part payment.

LIGHTWEIGHTS.—Minerva, 2 h.p., £6 15s.; Minerva, 2½ h.p., £8 15s.—Booth's Motor Exchange.

LIGHTWEIGHTS.—Quadrant, 1¾ h.p., £6 15s.; Centaur, 2½ h.p., £7 15s.; cycles part payment.

LIGHTWEIGHTS.—Jap, 2½ h.p., £8 5s.; Ormonde, 2¾ h.p., £6 15s.; all guaranteed.—Booth, Wade Street, Halifax.

ALL the above can be seen and tried at Booth's Motor Exchange, Wade Street, Halifax.

4½ h.p. Twin Minerva, Chater-Lea frame, Druid spring forks, 2¼in. Palmer tyres, in first-class order; price, including numerous spares, £27 10s.—Hayward, Skinnergate, Darlington.

TWIN Antoine, 5 h.p., Liberty upholstered sidecar, powerful, fast, good tyres, accumulators, belts, tools, etc.; price, complete, £24; owners buying car.—Sanford, Oatlands, Harrogate.

BAT Twin, 7-9 h.p., and sidecar, all accessories, and spares, £45; Minerva twin, 4½ h.p., both superb condition, £22; trial; take push bike part payment.—Sidney, 41, Green Street, Cambridge.

£9 for a 50 guinea 1905 3½ h.p. Rex, in good running order, with two belts, stand, lamp, horn, toolbag, Bowden lift, Longuemare carburetter, new A Won Clincher tyres, low build; not allowed to ride.—Read, Accarsane, Hook Road, Surbiton.

EVERYTHING DESIRABLE.

you will find in that superb machine, a

5½ h.p. REX DE LUXE.

Fitments—

ROC CLUTCH.	TWIN TYRES.
MAGNETO.	SPRING SEAT.
BLACK FINISH.	GOLD LINES.

Advantages—

Takes a sidecar up any hill.
Handle starting just like a car.
Side-slip unknown with twin tyres.
In traffic can be driven 3 miles per hour.

We supply one for £35 (shop-soiled).
We take your machine in part payment.
We can give instant delivery.
We save your money and patience.
We give you every satisfaction.

A Lovely TWIN REX, £22.

Plenty of power, plenty of comfort (spring forks), and we guarantee you a good machine. We will accept £6 and a decent 1906 3½ h.p. machine; liberal allowances for lesser powered machines. Write us, and you will be agreeably surprised.

A Smart 3½ h.p. LOW-BUILT REX, £16 16s.

Spring forks, will take any hill. We will relieve you of a small amount of cash and your present machine and supply you with above. Write us to-day.

WRITE FOR OUR FULL LIST

of motor cycles and accessories. We are certain to have something you require.

NEW TYRES FOR OLD.

PALMERS. Fully
CONTINENTALS. Guaranteed.

We take your old cover or tube in part payment. State your requirements. Immediate delivery.

SIDECARS.

SHAMROCK - GLORIA

Rubber and Canvas Belts command the largest sales all over the world.

WARNING.

These belts should not be confused with composition belts, or such made almost entirely of canvas.

SHAMROCK-GLORIAS are made of best India Rubber with a very strong canvas core. Durability is our first consideration, and in combination with many years of experience, improvements have been introduced which make the

1908

SHAMROCK - GLORIA

incomparable with any other belt on the market.

The best possible results are obtained only by Shamrock-Glorias, and this fact is well recognised by leading experts, as well as by the majority of motor cycling enthusiasts. Read this.

The Rev. R. M—— writes:
"13/2/08.

"I do not know a belt to equal it. I say this after running your belts for the last two years, and doing 8,200 miles, with only two belts, each one doing well over 4,000 miles."

At the first Motor Cycle Race at Brooklands, Shamrock-Gloria Belts only were used! See "*The Motor Cycle.*"

For a good performance and satisfactory transmission you must have the 1908 Shamrock-Gloria.

Unlike others, Shamrock-Glorias have long passed the experimental stage.

All sizes, ⅝in., ¾in., ⅞in., and 1in., ma e. Instructive Booklet on application.

Sole Manufacturers:
THE
Hanover Rubber Co.,
29-81, Old St., London, E.C.

THE PREMIER TWO-SPEED GEAR

With (Roc Licensed) INTERNAL EXPANDING CLUTCH.

? WHY DO YOU WANT IT?

When fitted to your Machine—

1. You can run a sidecar, though low-powered
2. You can negotiate traffic, though high-powered.
3. You can climb all hills under all conditions.
4. You can abandon pedals and start like a car.
5. You can start up or down hill without acrobatics.

There are lots of other reasons—all good ones—but this is only a 3 inch advertisement.

Just let us know what your machine is, and we will quote you for conversion.

IMMEDIATE DELIVERY.

STANLEY DERMATINE MOTOR BELT

AND

The Burning Question: LEATHER v. CANVAS AND RUBBER.

On the 7th February, 1908, Mr. H. G. Cove read a paper before the members of the Auto Cycle Union on "Motor Cycles and Accessories." The following are extracts from "The Motor Cycle," Feb. 12th, pages 127 and 128. The burning question of "Leather v. Canvas and Rubber Belts" was fully dealt with in the paper:

The next interesting item was a very good hint with regard to the canvas and rubber belts, which had been sent to the lecturer by the maker of the Stanley Dermatine Belt. His advice is that when the belt is taken off it should be replaced to run in the same direction, as if the pull comes in the reverse direction, the strain is likely to draw back the canvas, and, as a result, the rubber on the top of the belt cracks. The advent of the adjustable pulley had created a demand for an adjustable belt fastener, and two fasteners were shown which have just been placed on the market, one the Stanley, in which the hook is detachable and can be used in conjunction with an adjustable pulley to alter the gear ratio from 4 to 4¼.

In the discussion which followed, Mr. W. H. Wells remarked: There was a time when he used leather belts; that was when there was nothing else. Now he used a rubber belt, and nothing now would induce him to use a leather one. He was able to keep his hands and gloves clean. The best leather belt he was never able to ride more than 100 miles without cleaning it.

Mr. A. C. Pemberton said: Rubber belts were as good as could be wished for. The great fault of leather belts was that they would not stand the weather; when soaked with rain they commenced to slip.

Mr. H. G. Bell said: Speaking of belts, he always used a rubber belt now, but if we could get a good preparation for leather belts it would be a satisfaction.

Mr. M. I. Tuchmann remarked: As to belts, he considered the rubber and canvas belt the only possible one. It had no serious disadvantages. The belt had a tendency to assume a certain shape. He considered one of the best things they had seen that evening was the Stanley Fastener for Belts; he thought it would be greatly used this year.

The only original Canvas and Rubber Belt is the

STANLEY DERMATINE.

WANTED, gear box, chain drive, for tricar, also clutch, and any other parts.—4, Frances Street, Woolwich.

WANTED, 3½ h.p. motor cycle, Bat or Quadrant preferred, must be cheap.—Fox, 6, Hertford Road, Worthing.

WANTED, twin motor cycle; exchange 3½ h.p. Linon and cash, or sell £18. —Seen at 152, Crossbrook Street, Cheshunt, Herts.

WANTED, 3½ h.p. water-cooled De Dion engine, or similar; will pay £1, balance instalments.—Westfield, Pitsea, Essex.

WANTED, motor cycle, 3 h.p., or higher, perfect condition; approval, deposit.—Wood, Haile, Cumberland.

WANTED, twin engine, good make; also bucket seat; state lowest price for cash.—4, Frances Street, Woolwich.

1907 Motor Cycle wanted, not under 3½ h.p., magneto; cheap for cash. —Motorist, 6, St. Agnes Place, Kennington, S.E.

WANTED, twin Vindec, two-speed, late 1907 or 1908, with accessories; cheap for cash.—Smith, 66, Durban Road, Beckenham.

WANTED, spare valves, springs, trembler, voltmeter, accumulator, etc., for 2¾ h.p. Minerva.—George, 11, Liverpool Road, Islington, N.

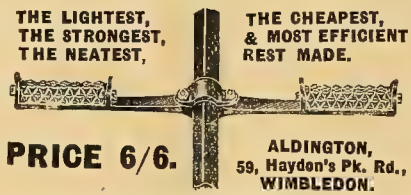
M.M.C. Cylinder Head wanted (2¾ h.p., 79 by 80), genuine or pattern, but first-class condition.—Broad, Cheltenham House, Hotwells, Bristol.

WANTED, tricar change speed lever and brake lever combined, or separate, also acetylene head lamp, also irreversible steering column (without wheel), for tricar.—Full particulars and drawings to Copper, 21, Fitzwarren Street, Salford, Manchester.

G. T. RICHES & CO.,
19, STORE STREET, LONDON.
RICH DETACHABLE AIR TUBE,
Fitted with the new Protective Sleeve

26in. x 2¼in., 14/6; 26in. x 2¼in., 15/6.
Your own tube converted. Please write for special list, with all prices for new tubes and prices for conversion, with instructions and hints. Our general accessory catalogue M free on application.

THE LIGHTEST, THE STRONGEST, THE NEATEST,
THE CHEAPEST, & MOST EFFICIENT REST MADE.



PRICE 6/6.
ALDINGTON, 59, Haydon's Pk. Rd., WIMBLEDON.

WANTED.

WANTED, Orient Buckboard, Eagle Trimo, or runabout; exchange 3 h.p. Fafnir bike, cash adjustment.—Reed, 7, Argyle Street, Gateshead.

2½-3 h.p. Inclined Engine, new condition, cheap cash; or 2 h.p. Minerva, carburetter, silencer, part exchange.—Hunt, Llanbradach.

WANTED, 3½ h.p. Quadrant, magneto preferred; must be in good condition, and cheap; London.—Box No. 9,428, *The Motor Cycle* Offices, Coventry.

WANTED, 1908 or 1907 motor cycle, perfect, magneto, spring forks; full particulars, lowest spot cash price. — Jeweller, 19, Upperhead Row, Leeds.

WANTED, F.N. lightweight, Motosacoche, Moto-Reve, or good lightweight; also 5 h.p. good twin; cash waiting.—5, Lorrimore Buildings, Walworth, S.E.

SIDECAR, Montgomery or Millford, castor, to fit Minerva, 26in. wheel, for right side; must stand expert test; cheap.—Thompson, 22, Chancery Lane, London.

WANTED, push cycle and cash, for 2¾ h.p. Minerva, perfect, like new; sell £14, lowest; will bring it 30 miles.—84, Loughrigg Street, Bradford.

WANTED, Open Frame Tricar, Riley or Singer preferred, exchange two-seater, 6 h.p. De Dion, cash adjustment, or sell £58.—Williams, 8, Lansdowne Terrace, Hampton Wick.

WANTED, 5½ h.p. Rex de Luxe, latest pattern, twin tyres, magneto, or 1907 Triumph, 3½ h.p., magneto, in exchange for 50 guinea Rex (very little wear) and cash.—J. Simmonds, Twyford, Berks.

LINCOLN-ELK, or other well-known make, lightweight bicycle, 2-3 h.p., free engine preferred, must be in excellent condition and cheap; push cycle adjustment, — J. Hargreaves, Bolton-le-Sands, Carnforth.

WANTED, Motosacoche, or lightweight low-geared motor cycle; will exchange piano player and music rolls; would give cash in addition for really good machine. — W. S. France, Broad Quay, Bideford.

WANTED.

WANTED, for cash, 6 or 8 h.p. genuine De Dion motor car, must be in first-class condition.—W. Ainsworth and 7, Hyde Road, Gorton, Manchester.

CYCLE Agents should read "The Cycle and Motor Trades' Review," the leading trade organ; specimen copy will be sent on receipt of trade card. — Address, "The Cycle and Motor Trades' Review" Offices, Coventry.

MISCELLANEOUS.

5 h.p. Water-cooled Hobart Tricar, seats three, new last year; £20.

DOUBLE Coach-built Forecarriage Attachment, large rubber footboards, seats two adults; £5 10s.

4½ h.p. Water-cooled Stevens Engine with tank, radiators, Longuemare carburetter, and silencers, nearly new £7 10s.

5Ft. Back-geared Lathe, treadle or power, very good condition; £4 10

PARAFFIN Brazing Lamp, largest size nearly new; £2.

6IN. Self-centring Cushman Three-jawed Chuck, new; £2.

TWO-SPEED Gear Box, all enclosed, chain drive; £3 10s.—Richmond, 2 Neachell's Lane, Wednesfield.

FULLER Four-cell Charging Battery, cost £2 2s., sell 15s.—Harry Eaton Witney, Oxon.

WHIPCORD Breeches, latest cut; 10 6d. — J. C. Savage, 119, Donegal Street, Belfast.

FOR Sale, Triumph 1907, 1908, magneto covers, registered; 6s.—John Guest and Sons, Walsall.

1¼ h.p. Light Motor Attachment, complete, good condition; 40s.—Motor 1, Rose Place, Oxford.

CHAIN-DRIVEN Motor Cycles, design for relieving shocks for sale. Museum, Warrington.

SHEDS for Motor Cycles, 45s.; portable.—Stevens, 82a, Leighton Road, Kentish Town, London.

COIL, double-cylinder, trembler, good condition; bargain, 15s. — 92, Melbourne Road, Eastbourne.

BUCHET Engine, 6 h.p., two cylinder, side by side, suit tricar; £5 10s. Genn, Gap Road, Wimbledon.

FOR Sale, Eldorado V Belts, price, ⅞in. 9d.; ¾in., 10½d.; ⅞in., 1s.; 1in., 1s. 2d. Pollin, belt maker, Spalding.

WHIPCORD Cycling Breeches, latest cut; 10s. 6d.; write for patterns. Booth, tailor, Longton, Staffs.

ENGINES, air or water-cooled, 3, 6, 9 h.p.; write for particulars.—Advance Motors, Ltd., Northampton.

FRANKS'S Lamp, and large separate generator, little used; 12s. 6d. Whittle, Blackdown, Farnborough.

NEARLY 9ft. new Stanley-Dermatine belt, 1in., not used five miles; 9s. 6 —Jones, Hendre, Penprys, Pwllheli.

BOWDEN Back Wheel Motor Cycle Brake, complete, new, never used 13s.—Parry, 60, East Hill, Colchester.

WHIPCORD Cycling Breeches, latest cut; 10s. 6d.; write for pattern —Booth, tailor, Longton, Staffs.

CHEAP Motor Cycle Houses; catalogue sent free.—Portable Building Company, Felsham Road, Putney, London.

PAIR 28 by 2½ Beaded Palmer Cord Tyres, new, £1 each; also free engine clutch, £1.—33, Killyon Road, Clapham.

OSBORNE Four-speed and free engine pulley, fit Rex; £2.—Winstanley, 2 Gloucester Mews West, Montague Square London.

YOUR New Mount is incomplete without the Advance adjustable pulley, £1.—Advance Motor Mfg. Co., Ltd., Northampton.

MAYFAIR Accumulators, guaranteed 15 a.h., 10s. 6d.; 20 a.h., 17s. 6d 40 a.h., 30s. — Fellows, Hertford Street Mayfair.

Exclusion of Dust.

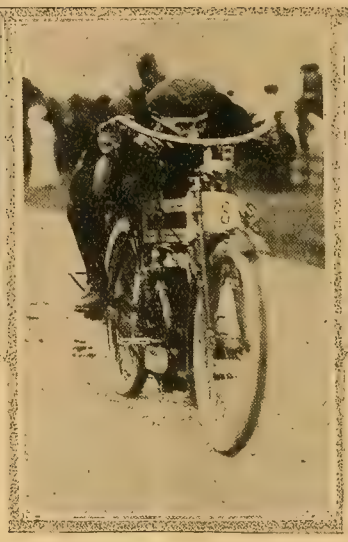
WE have consulted an engineer who thoroughly understands the sieving of very fine cement, flour, and other powder substances with a view to discovering if it is really possible to prevent the ingress of dust to the engine *viâ* the carburetter. From the enquiries made, we have come to the conclusion that any material employed for the exclusion of dust would have to be so fine in mesh that a very large area would be required to pass the requisite amount of air. Our engineer friend recommends a cloth material soaked in ether as the very best means of excluding dust, but as dust is so fine and the induction is so rapid in the case of a motor cycle engine, it would cause the ether to rapidly evaporate, and the cloth would require perpetually saturating with the ether to keep it moist. Under the circumstances, it would appear that it is almost impossible to prevent fine dust entering the engine, without going to extremes in the way of dust excluders which would be practically prohibitive on a car, let alone on a motor cycle. The particles of dust raised by motor and other traffic are so fine that ordinary wire gauze, or even muslin of a reasonable mesh, would not entirely prevent the ingress of particles, although it might do so partly. Readers will remember that an article appeared in these columns advocating that all the passages for air should be carefully guarded with gauze, but from closer investigation we have come to the conclusion that at present any gauze fitted to a carburetter would be practically useless in keeping out dust particles which are found in the analysis of deposit on the piston head and cylinder. These particles are so extremely fine that they could not be excluded from the engine without special appliances, such as are used in factories where work has to be carried on free from dust. There is also another thing in connection with this matter which renders gauzes practically inoperative, and that is the very finest gauze defeats its object by becoming in a few hours absolutely clogged up, one or two very fine particles of dust being sufficient to stop each hole in the gauze when it is a matter of several thousand meshes to the inch. We had the idea at first of entirely enclosing the carburetter in a metal box, fitted with gauze sides and ends, but when it came to working it out, we found that the size of the box would be prohibitive on a motor bicycle, and, even if constructed, the intakes would probably become too clogged to pass the requisite amount of air after a few hours riding.

The New Patents Act.

THE Act which was passed in August regarding the manufacture of foreign articles patented in England will have a considerable effect upon the Continental trade in motor cycles and accessories. An article on the subject is published elsewhere from the pen of Mr. Douglas Leechman, barrister-at-law—a writer thoroughly acquainted with motor cycle manufacture.

A person or firm manufacturing motor cycles or accessories on the Continent which are patented in England, will, when the Act comes into force, be compelled under certain conditions which are set forth in the article to make arrangements for their manufacture in England. According to the daily press, a large German firm has already made arrangements for a plot of land in Lancashire or Cheshire upon which to erect a factory for the manufacture of a patented article, we believe, of general use in the textile and dyeing trades.

HOW TO WIN HILL-CLIMBS.



THE FOLLOWING ARTICLE HAS BEEN PREPARED FOR US BY AN UNMECHANICAL AMATEUR, WHO SECURED FIRST AWARD IN EVERY HILL-CLIMBING TRIAL HE COMPETED IN LAST YEAR.

THERE are two points connected with the winning of a hill-climb outright, one or other of which nearly every amateur one sees competing fails to take into proper consideration. One relates to the preparation of the machine, and the other to the riding of it.

As regards the machine, it is commonly thought some secret "dope" is requisite for success, the fact being that mere *thoroughness* of preparation is what the trade riders attain, and the amateur usually overlooks. Careful, ordinary attention to every detail at the last minute is the clue rather than the furtive and frantic employment of some specially skilled knowledge.

Then having got his machine into perfect tune, the amateur is apt to forget that when fifths of a second decide the awards, the actual *riding* of his steed is at least as important as the bringing of it to the post in tiptop order. I propose to devote a little space to both these points.

And first as regards the riding of it. I may divide this under three heads—starting, windage, and levers.

Standing and Flying Starts.

1. STARTING.—Some hill-climbs commence with a flying start, which means that a hundred yards or so are allowed to get up speed before the bottom watch-holder is reached, and in others the time occupied in getting under way is included in the handicap. In both alike every fifth of a second is of equal importance, for I never rode yet in a flying start event where I had time to get going at my best before I struck the starting tape. For a winning start, three things are necessary:

The machine must start in a yard or so.

It must leap off the mark at high speed, *i.e.*, with spark as near as possible fully advanced, and the throttle wide open, not commencing at the ten or fifteen miles an hour which serve for a starting pace in ordinary riding.

From this second point it follows that the rider must waste no time in feeling for a pedal or footrest; if he did, the machine would leave him behind. He must go straight from the ground into the saddle as soon as the valve is dropped, and as clean as a whistle, so that he may get his hands on the levers and his body down along the top tube at the earliest possible moment. (This mount is very easily acquired by practice at lower speeds; if you have not enough nerve to learn it, you will not win a climb held by a "warm" club.)

2. WINDAGE.—The power absorbed by wind resistance increases inversely as the speed. Therefore the nose must be tucked down behind the steering column or close down on the lamp bracket, the back almost flat along the tube, and the knees kept well in to the tank. An uncomfortable pose truly, but the dash up the hill only lasts half a minute or so. This is why the reversed head-gearing is necessary, and not pure swagger as it is often supposed to be. With a big cap turned peak forward, it is impossible to see in a crouched riding position. No cap at all is preferable. The handle-bars must be of a design that leaves real control in this position. If the control be poor—and this position is not ideal for wrist work—to strike a stone at high speeds leads to a wobbling that means either a loss of several seconds or a smash.

Preliminary Trials.

3. LEVERS.—Every tiny mistake in handling the spark, throttle, or air lever means a second or two gone beyond recall. The lever control cannot be learnt on other hills than the actual venue of the trial. The probability is that, if you are good enough to win at all, your engine will never audibly slow from bottom to top; therefore you cannot learn lever settings by ear. Consequently, the only safe plan is to reach the hill in time to have a few preliminary bursts; it will still remain somewhat of a fluke whether you actually get the last two or three-fifths of a second out of your machine in the all-important timed spin, and you can not satisfactorily time yourself in practice. But you probably learn that an extra notch of gas or air at one or two points increases the speed, and save yourself the mortification of learning *en route* to the top that you have dropped a second or so that were really within your reach.

As regards preparation, every single item should be gone over, not at home the night before, but after ar

low to Win Hill Climbs.—

arly arrival at the hill an hour or two before the start. do not propose to go into all the preliminary work, vhich would mean a treatise in itself, but into one or wo points relating to preliminaries, and into one or wo more relating to the finishing touches just before unch.

1. The compression must be dead perfect before ou leave home. It will almost certainly have lost its nal veneer of polish *en route* to the hill, and this

Crossing the starting line at full speed.

ust be restored at any price. Test it while the engine warm, and test it by actual proof, not by feel. If e valves were a sound fit the night before, they will a sound fit still, unless you have recklessly scorched the morning. But take an oilcan of thick oil, and iear oil on all the compression joints externally, viz., .lve cap washers, compression taps, inlet valve domes automatically operated), and sparking plug. You ill almost certainly detect bubbles when the engine is rced over compression. First use a spanner to tighten ıy leaky parts, and then try again; if the leakage is ill evident, you must renew the copper and asbestos ashers, and tighten them well home, giving them a final ghtening after warming the engine just previous to the art. In 1906 I lost two climbs I ought to have won, ause the warming up of my engine in a long delay fore the start, had developed leaks through the spark-g plug washer.

Cleanliness Essential.

2. IGNITION.—Go over the whole of this system r cleanliness and tightness of connections. If the djustment was right on leaving home, it will still be ght in all probability, but there may be a little dust a slight greasiness which just detracts from perfec-on and robs you of two or three seconds. The con-cts at all events will be the better for flushing with trol and mopping with a bit of rag. The magneto ntact-breaker should be clear of oil. The sparking lug setting should be confirmed, and the lock-nut hich holds the porcelain in place lightly tested with a anner.

3. LUBRICATION.—Run all waste oil out of the crank chamber, and refill it with at least four pump-fuls of fresh. Start up the hill with your pump filled, and in the preliminary bursts see if a pumpful halfway up gives the engine fresh heart. After draining and again lubricating with four charges, pedal it round a few times to distribute the fresh oil.

4. CARBURETTER.—Many amateurs imagine the secret of their defeats lies in the carburetter. I doubt if it ever does in singles, but I know it often does in twins. A larger jet will pay in short bursts than is advisable in touring practice, say a 10-slot jet on a 5 h.p. twin, for instance, whereas in touring a 10-slot jet serves an engine of double the power. Having decided on the jet, the next thing is to make sure that the engine is receiving as much extra air as it will take at full speed. I do not know a single twin-cylinder carburetter which supplies enough air for a 5 h.p. twin at fifty miles an hour. The engine will almost drink neat air; and I find a huge tertiary inlet in the intake pipe the secret of winning on twin-cylinder machines. As such an improvised intake is difficult to work from the saddle when racing, I open it at the start, and commence with the lever operated air intake closed, and as the speed rises supply the needed extra air by the lever provided. With a single-cylinder engine, the normal air supply can usually be induced to provide all the air that is needed, but these machines are far more delicate to drive in hill-climbs. An hour before the start the jet should be dismounted, and its absolute cleanliness verified. Two minutes before the start the engine should be warmed up. A cold engine is almost as bad as an overheated one. If the carburetter is accurately adjusted, its lever need not be touched in a half-mile incline from bottom to top. On a mile climb, the engine should be started on full throttle, and the throttle closed down a little at different parts of the run as the gradient eases a trifle. On a half-mile incline, probably the throttle may be left full open all the way up, and the air lever just closed down a shade near the top, or where the grade is stiffest. In both cases the

Soaring over the brow of a steep hill.

How to Win Hill Climbs.—

ignition should stand full advance the whole way up with a twin, and with a single should need retarding only on the very steepest part of an extremely steep hill.

The Wheel Bearings Require Attention.

5. DETAILS.—There must obviously be as little belt slip and bearing friction as possible. How many amateurs remember to test, oil, and adjust their wheel bearings and free-wheel clutch, for instance, before competing in a timed climb?

6. LIGHTENING THE MACHINE.—If you are to score fastest time, everything of which the machine can be stripped under the entering agreement should undoubtedly be taken off. If, however, you are going for first award on formula, it is well to work out the formula as a test on the following lines: Take two identical machines, say two 5 h.p. Blizzards. Credit each with different times and different weights, *e.g.*, fifty and fifty-three seconds and weights of 150 lbs. and 160 lbs. If the extra weight of the second machine scores better than the faster time of the first machine, and would be placed first in the handicap, take down some unneeded weight to the venue in the form of tools, clothes, etc. Then make your trial spins under different weights till you have arrived at that weight which allows your machine to go full buzz from the bottom to the top as near as you can say. Ride that weight in the trial, neither more nor less. A few pounds of extra weight do not appreciably slow your machine, and yet score as much or more on the formula as those extra seconds you cannot secure. I have never ridden in a climb as light as I could have done under the rules. I first coax the machine to go up as fast as I can, and I then add as much weight as I can without appreciably slowing the machine.

7. GEAR.—The gear ratio is a most important point. Do not adopt a gear which takes the foot-hill at a furious pace and causes you to retard the spark on the stiff knuckle higher up. Select a gear—an adjustable pulley makes this simple—which will allow the engine to be doing full buzz on the crux of the hill. If limited to one gear through not having an adjustable pulley or through using a chain drive, you are more likely to show up well with too low gear than with too high a gear.

On the Course.

8. COURSE.—Study the course beforehand. Mark out mentally a line on the road which you intend to follow in the timed trial, cutting across the bends as straight as ever you can. If you neglect this you may have to use the brakes to round a corner, or may find yourself on the rough edges of the road, and lose time through jolting or wobbling.

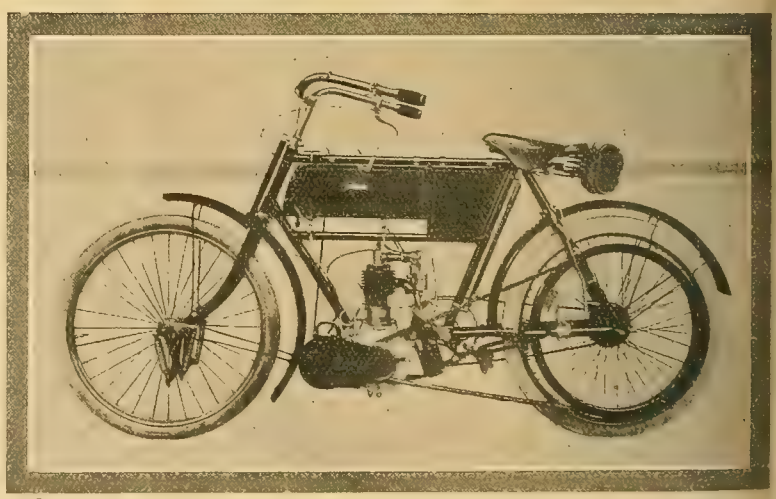
9. Before starting do not forget to see that all the holes of the silencer are clear of mud and burnt oil.

10. Screw the petrol tap tight in the wide open position before starting, lest it should shake into a partially closed angle. Have the tank fairly full; a good head of spirit in the tank ensures a good feed to the carburetter. It is well to see in preliminary practice if pressing down the float tickler increases speed up the hill. If it does, the petrol should be set at a higher level in the jet. Moreover, if the carburetter gets externally wet in trial practice, the vibration is causing it to flood, and some form of damping cap should be used on the top of the needle.

11 (and last). Don't let the officials bustle you at the start. Some men when clad in a little brief authority become amazingly fussy, and want you to start before you are ready or while the road is not clear. On the other hand, don't keep them waiting.

THE 1908 ARIEL LIGHTWEIGHT.

THE illustration herewith is from a photograph of the latest 2½ h.p. Ariel lightweight motor bicycle, manufactured by the Components, Ltd. (Ariel Department), Bournbrook, Birmingham. A number of improvements have been made in this model, including spring forks, longer handle-bars, backward seat-pillar, extra wide mudguards (the rear one made in two halves, so that it is easily removable for tyre repairs), and separate exhaust valve lifter. Magneto ignition can now be fitted if desired, the magneto being driven by a chain from the engine-shaft. The chain is enclosed in a case, which will readily be seen in the photograph. The Ariel 2½ h.p. lightweight brought up to date should find a ready sale among those riders who desire a moderately powerful machine, yet a motor cycle throughout; that is to say, specially built with motor cycle tyres, mudguards, frame, and fittings. We have been offered one of the new lightweight models fitted with magneto ignition for trial very shortly, and shall then have something to say regarding the machine's performances.



Some new improvements will be noticed in the 2½ h.p. magneto lightweight Ariel depicted above.

Ferrofix brazing is a new process for brazing cast-iron which it is claimed renders a cracked water jacket as new without injury to the cylinder. Borfix is a new flux introduced by the same firm, the Ferrofix Brazing Company, Dock House, Billiter Street, from whom all particulars can be obtained.

The Selection of Gear Ratio.

By A. G. LEE, B.Sc.

THE last few years have seen the introduction of variable gears, capable of more or less rapid adjustment, either from the saddle or by dismounting. The problem of the best gear ratio to be used for a particular purpose therefore presents itself, and the object of the present article is to offer an indication of the method of solving it.

It may, I think, be taken as an axiom that the best gear ratio is the one that allows the engine to give its maximum power at the maximum speed which it is capable of propelling the machine against the given adverse conditions, *e.g.*, head winds or hills. This statement does not take overheating into account, but, if the hill is not too long, this may be neglected.

Horse-power Required on the Level.

The question of a machine on level ground will first be considered.

The resistances which have to be overcome in riding on the level are:

(1.) Transmission losses.
(2.) Air resistance.
(3.) Resistance to traction (chiefly pneumatic tyre losses).

In the results shown below the transmission efficiency is taken at eighty-five per cent. and the other resistances are multiplied by the efficiency factor $\frac{100}{85}$ to refer them to the engine pulley as the common basis.

The horse-power at the engine pulley required to overcome the air resistance has been calculated from the following formula, which is a modification of that given, I believe, by Hutton:

$$\text{b.h.p. required} = V^3 A \times 0.00001145.$$

The brake horse-power required against traction resistance is

$$\text{b.h.p. required} = W V \times 0.0000575.$$

Where V = velocity in miles per hour.
W = total weight of machine plus rider in lbs.
A = area exposed to air resistance in square ft.

Fig. 1 shows the horse-power required against air resistance and traction separately at different speeds for a machine and rider with W = 300 lbs. The total horse-power curve shown is the sum of the vertical ordinates of the separate air resistance and traction curves.

It will be observed that above sixteen miles per hour the air resistance becomes the more important factor. Another fact which may be noticed is that at twenty-seven miles per hour the total horse-power required is double that at twenty miles per hour, and at thirty-five miles per hour it is double that at twenty-seven miles per hour, showing the very rapid increase of the horse-power required with the speed.

The curve at the top is the brake horse-power curve of the particular engine under consideration, at full open throttle and with a gear of 4½ to 1 at the different speeds.

It will be seen that the maximum horse-power is 4.3, which is developed at thirty-seven and a half miles per hour. This is exactly equal to the horse-power required at that speed, so that this particular machine can travel no faster. (I may here remark that the area opposed to the air resistance has been taken to be six square feet, a figure which does not apply to a racing rider sitting in a crouched position.)

For the fastest speed on the level, then, the gear must be chosen as follows:

Find the maximum horse-power of the engine by a brake or other test, and also the number of revolutions per minute at which it is developed. In this particular case it is 4.3 h.p. at 2,200 revolutions per minute.

Next find the speed on the "total horse-power required" curve in fig. 1 at which 4.3 horse-power is required. In this case it is thirty-seven and a half

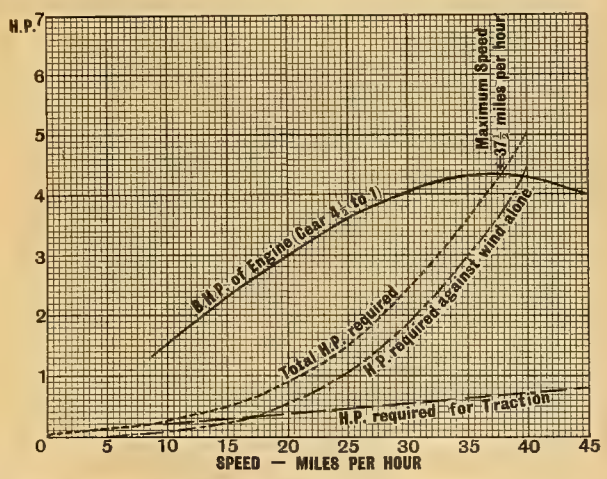


Fig. 1. Horse-power against air resistance and traction resistance on level. W = 300 lbs.

miles per hour. The required gear ratio may then be found as follows:

$$37.5 \text{ m.p.h.} = 37.5 \times 1.467 \text{ feet per second} = 55 \text{ feet per second.}$$

The distance travelled in one revolution of a 26in. wheel is $\frac{26}{12} \times 3.14 = 6.8$ feet. Therefore, number of revolutions of back wheel are $\frac{55}{6.8} \times 60 = 485$ per minute, and the ratio should be $\frac{2{,}200}{485} = 4\frac{1}{2}$ to 1.

I may add that this gear also happens to be a fairly efficient one from the point of view of petrol consumption, as the internal engine losses are very much greater near the point of maximum horse-power than they are at half load, as indicated by the bending over of the brake horse-power curve. Taking twenty miles an hour as the average speed of this machine, it will be seen that the engine is worked at a very efficient point. This does not, of course, allow for the slight loss of efficiency due to throttling at the lower speeds.

Horse-power Required on a Hill.

The horse-power required in this case includes the air and traction losses and, in addition, the power necessary to lift the machine up the hill.

The latter may be taken to be brake horse-power required $= \frac{V W}{X} \times 0.00314$ where the gradient is 1 in X.

The Selection of Gear Ratio.—

Fig. 2 gives the total horse-power required on various gradients at different speeds by the same machine and rider. The brake horse-power has also

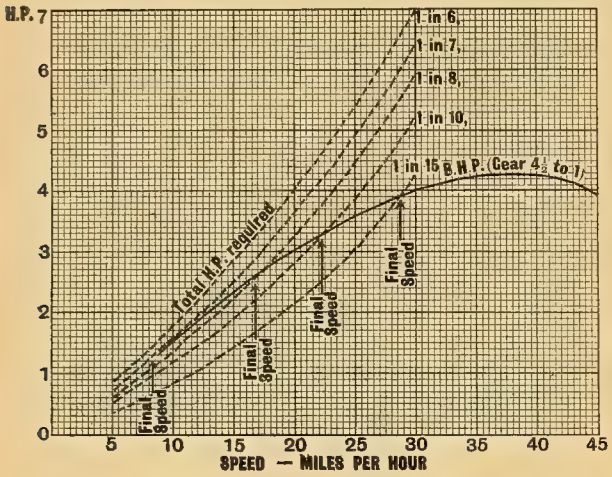

Fig. 2. Horse-power on different gradients. W=300 lbs.

been shown on this diagram. It will be seen that where the horse-power available becomes equal to the horse-power required on any particular gradient, that point determines the final speed to which the machine will settle down after the effect of the rush at the bottom has gone.

The final speeds with a gear of 4½ to 1 will be seen to be:

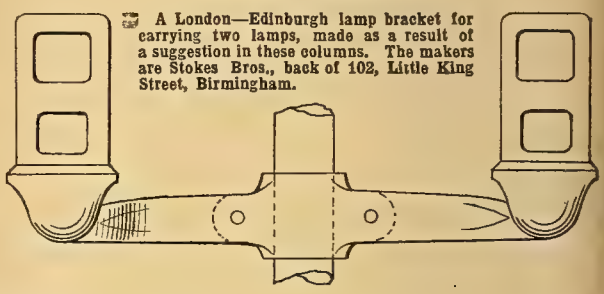
Gradient.			Final speed.
1 in 15	...	...	28.5 miles per hour.
1 in 10	...	...	22.5 ,, ,, ,,
1 in 8	...	...	16 ,, ,, ,,
1 in 7	...	...	7.5 ,, ,, ,,
1 in 6	...	...	Machine will not climb.

To Find the Best Gear.

The following are the speeds on each gradient at which the total horse-power required is equal to 4.3. The gear ratio given in the right-hand column is calculated in the same way as described above for the machine on the level. If the maximum horse-power of the engine is lower or higher, then the speeds corresponding to the actual horse-power available must be taken.

Gradient.		Maximum speed.		Best gear ratio.
1 in 15	...	30 miles per hour	...	5½ to 1
1 in 10	...	27 ,, ,, ,,	...	6¼ to 1
1 in 8	...	24.5 ,, ,, ,,	...	7 to 1
1 in 7	...	23 ,, ,, ,,	...	7¼ to 1
1 in 6	...	21 ,, ,, ,,	...	8 to 1

(To be continued.)



A London—Edinburgh lamp bracket for carrying two lamps, made as a result of a suggestion in these columns. The makers are Stokes Bros., back of 102, Little King Street, Birmingham.

MAGNETO IGNITION.

IN his remarks in a recent issue "Geoffrey" discusses the question of ignition timing as applied to magnetos. In this connection it is a point worth noting that, if the alteration of the firing position is so provided that the spark occurs always at the position of maximum strength of the field, then the range of movement required would be much less than is necessary in the case of accumulator and coil ignition. The reason for this is, of course, to be found in the fact that as the speed of the armature increases the spark produced becomes larger and hotter, and combustion is commenced and progresses more rapidly. No doubt magneto makers have depended upon this automatic timing action in designing magnetos for motor cycles without providing any means for adjusting the timing of the spark. The present method of giving the contact breaker a range of movement independently of the armature defeats its object to a large extent, because any alteration of the instant of firing either behind or in advance of the maximum point means a weakened spark, and most of what is gained by advancing the spark is lost through the spark itself being reduced in heating power. It is probable that a greater range of engine acceleration is possible with a fixed ignition point, than can be obtained by varying the instant of rupture of the primary to positions other than that at which the armature is cutting the strongest field. J.B.

[Shortly we hope to describe a device for retarding and advancing ignition, and obtaining a spark of equal strength at all speeds.—ED.]

INCORRECT SPRING FORKS.

HOW is it that so few of the spring forks on the market are designed on correct lines? The essential qualities are sufficiently simple and obvious. The shock-absorbing movement should occur in a vertical, or nearly vertical, direction, and the wheel should be so held in the forks that one end of the spindle cannot lift except in unison with the other. Sidewise rolling of the wheel in the forks should be impossible, and the front spindle should never lose its parallelism with the back one. Yet contrivances are made and sold in which up and down travel of the wheel is possible only in conjunction with a large backward and forward movement, and quite a number of types are marketed in which each end of the front spindle is independently pivoted to the corresponding fork end, so that any lateral pressure tending to lift one side of the wheel more than the other has to be transmitted to the opposite side of the fork by the spindle itself. It is not necessary to point out that in this way the spindle may be subjected to strains immensely greater than would occur if the wheel were carried in a rigid fork whose two sides were incapable of separate motion.

The essential feature for a correct spring fork is that the wheel should be carried in a rigid fork, and the fork and wheel as a whole should be provided with the necessary up and down range of travel to take up road shocks. In addition to preventing strains on the spindles and erratic steering, such an arrangement allows of the employment of a front rim brake. J. B.

The Future of Motor Cycling.

EASTER, 1908. The ROC Already Five Years Ahead

HAS STARTED A PATTERN WHICH ALL MUST SOONER OR LATER FOLLOW.

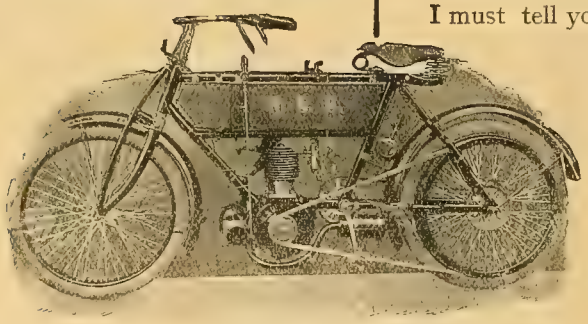
Why wait for delivery?

By placing your order for an N.S.U. delivery of any model is ensured at once.

An instance: ☛



3½ h.p. Single cylinder N.S.U.

Progress Cycle Depot,
New Road, Blackpool,
March 8th, 1908.

Gentlemen,

I received the 3 h.p. Motor Cycle yesterday and I am delighted in so quick a dispatch after you received my telegram. I was only 24 hours getting the machine after my order, which I think is a record in all my 15 years' experience, considering the distance of about 300 miles it had to come. I must tell you I think it is the smartest Motor Cycle on the market to-day. Not only do I think this but all the other motor cyclists in Blackpool and District.

Yours faithfully,
(Signed), J. STANWORTH.

We have a repair department especially organised and equipped to undertake all repairs. Spare parts can be obtained per return. The N.S.U. Two-Speed Gear can be fitted to any existing model.

Our 1908 Catalogue will be sent on request. Write

The N.S.U. Motor Co., LTD.,

78, Charlotte Street, London, W

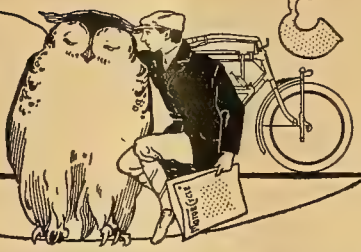
QUESTIONS & REPLIES



A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and, whether intended for publication or not, **must be accompanied with a stamped addressed envelope for reply.**

More Air Wanted.

(1.) I have recently bought a 3¾ h.p. magneto N.S.U. It will only start with air inlet fully open. Does that mean it wants an extra air inlet? If so, where? (2.) When slowing up by raising compression lever the engine backfires before stopping. What is the reason?—T.H., Leeds.

1.) Yes, it seems as if an extra air inlet is required. You will find auxiliary shutters on the sides of the carburetter which can probably be opened further. The extra lever should be closed at starting and opened when under way. 2.) You can cure the backfiring by closing the throttle when pulling up, or switching off the spark.

Piston Rings on F.N. Machines.

I have a 2¾ h.p. F.N. motor bicycle, and find on stripping the engine to clean the piston and combustion head that there are only two rings fitted to the piston. Kindly say if there should be two or three rings fitted to this engine, as one of the grooves is minus a ring.—L.L.C.

We find on communicating with the makers that the only F.N. engines fitted with three rings are the 3 h.p. and 3½ h.p. four-cylinder engines, and the 1¾ h.p. lightweight. The 2 h.p., 2½ h.p., and 4½ h.p. four-cylinder engines are fitted with two rings only. The remaining groove is to assist in the lubrication, we believe.

Sidecar Attachments.

(1.) Is it legal to ride a motor cycle with a car driver's license? (2.) Is it compulsory to have a separate number-plate on the back of a sidecar when the back number on the bicycle is visible, and if so, has it to be illuminated at night? (3.) I have noticed that you advise two-speed gears with twin engines and a sidecar. Do you consider a two-speed gear indispensable with a gear of 5½ to 1, or is it a luxury? (4.) How much more power does it take to drive a sidecar than a trailer?—H.W.E., Burslem.

1.) A car driver's license allows the holder to also drive a motor cycle. 2.) No, a separate number-plate is not required on a sidecar, nor is it compulsory to have it illuminated at night. We should, however, advise you to carry a rear light for your own safety's sake. (3.) With a sidecar, a two-speed gear is practically indispensable for touring purposes. (4.) Very little more power is required to drive a sidecar than a trailer, except when travelling against the wind; the larger area exposed to the wind then requires more power to propel it.

The Use of Two Coils.

(1.) I carry two accumulators and have switch for same. I also wish to carry two coils—one trembler and one non-trembler. Kindly tell me how to wire up? (2.) I have travelled over 18,000 miles with my present machine. Carburetter Longuemare, slots soldered up, and one small hole in centre of nipple, choke tube 21. These have never been altered, nor has the exhaust ever been connected up to carburetter winter or summer. I ride every day wet or fine. Lately I have had a lot of trouble with engine coming to a stop very quickly. First signs a peculiar popping sound in exhaust, but no misfires. Second, engine begins to slow down. Third, and almost immediately stops as if all brakes were on. I get off and flood carburetter and start again at once, and the same thing happens again in a quarter of a mile. Flooding carburetter on first signs does not help matters. It now does this every day—wet, fine, fog, frosty, or warm. Petrol supply and carburetter are all clear. Wires good, plug ditto. Coil Bassée-Michel quite new. Can you tell me where to look for the fault? The engine is a 3½ h.p. Minerva, air-cooled by fan.—A.M., Hanley.

(1.) You seem to have overlooked the fact that in the case of a non-trembler coil the spark takes place when the contact is broken, and in the case of a trembler coil the spark takes place at the moment the contact is made. You would therefore have some difficulty in correcting this trouble, and we should hardly think the conversion would be worth while. (2.) The trouble mentioned in your letter is a most mysterious one, and it is almost impossible for us to say what is its cause without personally examining the machine. Are you sure that the valves are working properly and do not become jammed at any time? Also overhaul the wiring for anything that may cause a temporary short circuit. If the coil is a trembler, it may be due to the platinum points sticking.

High Gear and Exhaust Valve Lift Affecting Hill-climbing.

My 3½ h.p. N.S.U. is quite fast on the level but weak on hills, and I suspect two things, but should like your opinion on it. (1.) The pulley is 4in. in diameter and belt rim 16in. in diameter. This is a gear of 4 to 1, is it not? Do you think this is too high for my weight (11½ stones), engine 80 by 80 mm.? (2.) I do not think there is sufficient lift of the exhaust valve because, if when I am running about usual speed I lift Bowden exhaust lifter up about ⅛in., I seem to feel quite a difference in power; in fact, I feel a distinct pull forward. So I think that the exhaust does not lift sufficiently. What is the best way to measure the lift, as it is rather difficult to see on my engine? Will it be the tappet or the cam worn? (3.) The grooves of the pulleys are ⅜in. wide, and belt is 13-16in. wide. I should very much like to know whether I could fit a 1in. pulley and 1in. belt rim to my machine as it stands, as I need a new pulley, and so would like to make the change now. Would you recommend a belt rim of larger diameter, say 19in.? What gear would you recommend me to use, 5 to 1? I do not want great speed, but general good running and hill-climbing. I may say engine has just been overhauled and all carbon deposit, etc., scraped from cylinder and piston.—F.B.B., N.B.

(1.) It appears that the gear of 4 to 1 is rather too high for your weight. (2.) The lift of the exhaust valve is probably sufficient, and very likely too much. The increase of power is due to your not allowing the valve to close completely, with the result that more air is admitted to the mixture during the induction stroke. Going uphill, slightly raising the valve in this manner would be of no advantage, but on the level it gives a slight increase of engine speed. Probably it is an indication that the carburetter is not receiving sufficient air at high speeds. (3.) There is no reason why 1in. pulleys and belt should not be fitted, but both pulleys must be 1in. A ⅞in. belt is quite sufficient for an 80 by 80 engine. Yes, the 19in. belt rim would be much more suitable. 4¾ or 5 to 1 gear would be about right if the wheels measure 26in. Poor compression would account for bad hill-climbing.

Size of Wheels and Gear. Magnetos.

(1.) Does the size of the road wheel affect the gear of the machine, as, for instance, if there are two machines, one with 24in. and the other 26in. wheels, both geared 4½ to 1, has the one with 24in. any advantage over the 26in. on hills? I have been told that the small wheel lowers the gear, but should like your opinion. (2.) How often do the magnets of a magneto require remagnetising? Is it possible to tell when the time is getting near for it to be done, as although the magneto sparks all right now, I wish to be quite sure it will be all right for the whole season?—A.J., Scarborough.

(1.) The gear ratio remains the same if pulleys are the same size, but the smaller the wheels the less distance they cover at each revolution, so it can be said that small wheels lower the gear. A machine with 24in. wheels and the same gear ratio would be faster uphill than one with 26in. wheels. (2.) The magnets should not require remagnetising oftener than once in three years, and not then unless armature is removed from tunnel without placing a keeper across the magnets.

Misfiring and Stoppage of Engine.

My machine is a 2¾ h.p. Vindec with F.N. engine, automatic inlet valve. It has been standing idle for some time, and when I took it out it started right away after injecting petrol, but stopped in a few seconds. I cannot make it keep going, unless I continually flood the carburetter. The jet is quite clean, but still I cannot succeed in keeping the engine going. Could the inlet valve have anything to do with the trouble? Would you advise me to fit to a 5½ h.p. twin Rex a R.O.M. contact breaker? Does it fulfil all that the makers claim?—T.B.G., Ireland.

The trouble seems to be entirely due to the carburetter, which appears to be getting too much air. See if the choke tube has become detached, or that there is no special leak through which more air than is required can get. If you can find no cause, try partially obstructing the fixed air supply by fitting a sleeve behind the gauze-covered funnel. Anything will do temporarily, so as to aid you to find the trouble. For instance, a piece of rubber tube fitted in the orifice would reduce the air supply to a considerable extent. We do not think the trouble is caused by the inlet valve if the spring is satisfactory and the lift is about right. It might be covered with lubricating oil and sticking occasionally, in which case it should be washed with paraffin. Yes, the contact breaker in question should effect an improvement in the running of your engine.

How to Increase Speed.

I am trying to make my friend's single-cylinder 1905 model Rex motor cycle attain a better speed, and keep up with my twin of the same make. I have scraped away all carbon deposit from piston and cylinder head, fitted new exhaust and inlet valves well ground in, obtaining perfect compression; also made new tappet for exhaust, giving nearly ¼in. lift, and when the valve is seated there is plenty of clearance between valve stem and tappet to allow for expansion. The ignition appears to be good and not late. When retarded, spark occurs at top of stroke, and yet it will not obtain the speed it ought to, although it climbs hills excellently. (1.) Would you kindly suggest anything else I could do? (2.) Should a mechanical inlet valve lift when the piston is just over the top after exhausting, or about quarter-way down?—Y.L., Birmingham.

(1.) The symptoms described in your query seem to show that the carburetter is not receiving sufficient air at high speeds; you must therefore experiment and try the effect of a larger air adapter. You have not mentioned the coil. If it is a trembler the platinum points might be trimmed and the screw adjusted as lightly as possible consistent with even firing at full engine speed. The gear might also be raised slightly. Have you tried new valve springs? (2.) You should set the mechanical inlet valve to close simultaneously with the piston reaching the bottom of the induction stroke.

Interested in Motor Attachments.

I have a Sunbeam two-speed gear (59 and 78) cycle fitted with oilbath gearcase, frame 24in., weight about 33 lbs. (1.) Would my machine be strong enough to bear the strain of a 1908 1¼ h.p. Motosacoche set? (2.) Could I average fifteen miles an hour with this combination, say from London to Brighton and back? My weight is ten stones. (3.) Would the change-speed gear be an advantage for starting easily and assisting machine to climb steep hills? (4.) In your opinion is the Motosacoche a well made and reliable machine, and suitable for rides of 100 miles or so at a moderate pace?—A.H., West Ealing.

(1.) The cycle in question might be strong enough with the addition of spring forks, but we should advise you to consult the makers of the Motosacoche and take their advice, as to have too light a bicycle with a motor on it is apt to prove dangerous to the rider. You should also ascertain if there is sufficient clearance for belt rim and belt. The majority of pedal bicycles are too narrow at the back and chain stays. (2.) Yes, you could easily average fifteen miles an hour. (3.) A change-speed pedalling gear is undoubtedly an advantage for assisting the machine by pedalling. (4.) The attachment in question is well made and would prove quite reliable with fair usage and attention.

We have had under consideration for some time the introduction of a new feature in our "Questions and Replies" columns. Although we endeavour to diagnose a complaint as well as we possibly can from particulars (sometimes very scant) given by correspondents, it is impossible to trace a fault accurately every time, without having the machine by us for examination. This being the case, we shall continue the "Questions and Replies" as hitherto, but we shall be also willing to publish, when space permits, short letters from riders of the particular machines enquired about, who have experienced similar failures, stating what they think will cure any trouble described. Different makes of machines have ailments peculiar to them, and no one can possibly diagnose a complaint better than the rider who is thoroughly conversant with his mount. In any case, an exchange of ideas will do much good, and we have pleasure in publishing a letter received from "A.S." (Northumberland) in reply to "Puzzled," who enquired in the issue of March 11th for information with regard to a second-hand four-cylinder F. N. motor bicycle.

Seeing your query under the name of "Puzzled" in *The Motor Cycle*, and having learned to ride on a second-hand four-cylinder F.N. which came to me entirely out of gear, I am very keen on the four-cylinder F.N., but realise that it takes some mastering. My old 1905 machine, improved by adding the later transmission, is quite good enough for me, and holds its own with any machine about here.

1. I presume you have changed the plugs and still found the front cylinder misfire, so presume plug is O.K. Have magneto contacts .5 mm. apart when broken.

2. See if the rings are sound and set with their slots evenly spaced round the piston. The middle ring should be slotted opposite to the other two. If they seem to have worn much put in three new rings and see that all carbon is cleaned out of the grooves in the piston with a sharp knife, or you may think the rings are too big, when they are not.

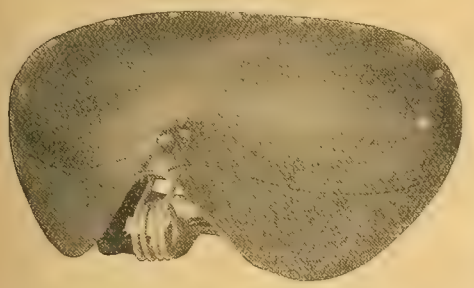
To make sure that the inlet valve does not stick change it with one from another cylinder; have all the inlet springs of equal strength. Then see if the disc in the distributer is not worn hollow. If so, get some emery and clean the whole distributer out. File (or fit) the brass discs flat. Always keep them dry. Some oil gets out past the end of the camshaft, and I fit little washers of cloth to prevent it getting into the distributer.

If it still misfires I can only suggest that the tappet is too long, and the exhaust valve does not close down hard. There should be the least bit of play between the tappet and the end of the exhaust stem, just enough to feel and no more, or else if the machine is old it does not lift enough. I solder little pieces of an old saw on to the tappets every year to get as much lift as possible, but there must be just as much play as will let a piece of thin paper between. I cannot think carburation is at fault, as three of the plugs are right. Finally, make sure the wire is sound from the distributer to the plug. I have such confidence in the machine that I feel sure your fault can be remedied.—A.S., Northumberland.

BROOKS

BROOKS Motor-cycle Saddles

are the most easy and smooth riding seats for the motor cycle. They are made in two styles—B.100 for the ordinary frame and B.105 for the special frame having the seat pillar extended horizontally from the top tube. In other respects they are alike—and both are the most popular models made.

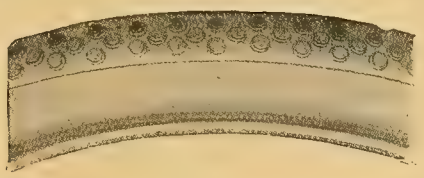


BROOKS Spring Seat

for the luxury-lover are a revelation. They are constructed on the same anti-vibratory principles as the B.100 model, but in shape are of chair seat proportions. Nothing so comfortable is the verdict of all riders who have tried a spring seat—would you like one.

BROOKS "Stratex" Motor Belt (Berisford's Patent)

is pre-eminently the belt for all motor cycles, etc. It suits all makes, and its special features cater for just what every motor cyclist requires—strength, grip, even pull, flexibility, smooth running, and everlasting wear. These are its leading features and those which make this belt the very best to buy.



BROOKS Non-skids

have earned rich expressions of satisfaction from all users. We have many letters testifying to their perfect efficiency in defying puncture and skidding. The perfect chrome leather—strong and well fitted. The special "Long-life" Studs—same pattern as used on the big cars, only smaller—correct size, shape, and fit—these are the advantages of the Brooks non-skids. Do they appeal to you?

Ask for Complete Catalogue of these and our many other specialities.

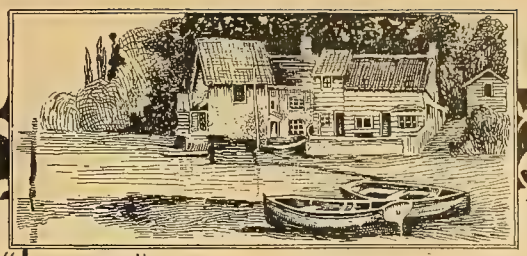
Occasional Comment



By "Ixion"

Handle Grips.

Apropos of my note on a patent hooked handle grip designed to avoid the hands slipping off the bar, Mr. Wells writes me about another patent device named the Kumfo, made of sponge rubber, and designed with the double purpose of affording a surer grip and insulating the palm and fingers from vibration. Mr. Wells used these grips in the last Edinburgh run, and I can well understand they saved his hands a great deal. The question of the ideal grip is a difficult one. One firm uses ordinary pedal cycle grips, and the inverted levers keep the hands on; the Vindec people use the Kumfo; other firms use a corrugated celluloid pattern with a raised ridge round the outer edge. I find objections to all. The edge of one's glove or the hem of one's coat sleeve is apt to get nipped by the part of inverted lever which protrudes from the bar when lever is operated; the celluloid grips get very greasy when the hands are hot, and are a little bit slippery even when used with gloves or cool hands; and, though the rubber grips are splendid insulators from vibration, I do not consider they safeguard the grip at all when the hands are only lightly clenched on the bar, and that is just the moment when a bump over a stone does the damage. I am going to try the combination of Kumfo grips first with inverted levers, and then, if I can get a pair of the Hill hooked grips small enough, I shall try a pair of Kumfos on the top of them—the Kumfo for insulation, and the hooked grip for safety. But no doubt the only absolute safeguard is for the rider to keep a firm grip of his bar and a keen watch on the road whenever he is exceeding thirty miles an hour. Some youthful riders take a delight in swaggering along at high speed with one hand on the throttle, and only holding the steering bar straight with the palm of the other hand. This is courting a sudden and rather abraded exit from this world of trouble.

Permanent Sidecars.

"Bandsman" reminds us on page 190 of a rather interesting chassis built to his order, and illustrated in this paper on July 31st of last year. It consisted of a sidecar frame permanently brazed to a motor bicycle frame. This destroys one feature which is largely responsible for the popularity of the sidecar, to wit, instantaneous detachability; but if a rider does not use his cycle as a solo, it is well worth doing. With detachable sidecars there is always the possibility of losing important nuts, and I have also found that in wrenching the outfit round a corner rather sharply the sidecar clips will occasionally slip a little on the frame. This is obviated by taking corners at a reasonable speed; but when there are no hedges I plead guilty to enjoying an experiment at an open corner, and seeing at how high a speed I can round it, provided there is no one about. My joy at taking a right-angled corner on a wheel and a half has two or three times been seriously modified by finding I had made the sidecar slip out of its true position on the frame, and that for the rest of the journey I had to keep the helm over to one side even when driving straight. A brazed, homogeneous frame naturally means increased strength and rigidity, as well as permanence of adjustment.

Lamp Brackets.

We are evidently not going to suffer from lack of good headlights this year, but I must issue a word of warning in that connection. The Autoclipse lamp —now no longer on the market, as it could not be produced at the price—was not so heavy as several of the new headlights recently described, but it was heavy enough to snap some of the standard "tongue" brackets on the market in a very short time. Now, a motor cycle lamp must be heavy—the slightly enlarged pedal cycle types are no real use for night riding at motor cycling speeds—so purchasers of efficient headlights will be well advised to use double armed or prong brackets on car lines, clipping them to the stem of the handle-bars. One of these new lamps has a very practical little feature; it is provided with folding legs, so that it can be propped upright on the ground to illuminate any road side repairs.

Mechanical Nipples for Bowden Wires.

I am sorry to see these have been withdrawn from the market. One of my friends gave me a handful twelve months ago, and they have been invaluable. As the maker says, they are "not a success," in that they are no substitute for soldering, and the joint made is only a temporary one. But one is very grateful for a roadside device which will enable one to repair, say, a broken exhaust valve lifter by the road side miles from anywhere. I think the sales of these nipples must only have been disappointing because the maker failed to advertise them amongst motor cyclists, and if he still has his patterns I am sure he will find plenty of customers. In this connection I will repeat the ancient tip about a broken valve lifter wire, as several riders of my acquaintance have met that tiresome mishap already this year. Take a coin, knock a hole in it with a nail, tie one end of a piece of string to the coin and the other to your wrist; put the coin between the valve and its tappet, pedal till there is way on the machine, and then jerk the coin out and haul it in for use after the next stoppage. Control speed by throttle or switch. But this is a very makeshift expedient. [On a four-cylinder it would cost 4d.—Ed.]

The Revocation of British Patents worked Abroad.

By DOUGLAS LEECHMAN, Asste. Inst. Patent Agents, Barrister-at-Law.

ONE of the most important innovations effected by the new Patents and Designs Act (7 Ed. VII., Chap. 29) is the provision made for the revocation, under certain circumstances, of patents worked chiefly outside the United Kingdom.

The section (27) dealing with the subject prescribes that at any time not less than four years after the date of a patent, and not less than one year after the 28th of August, 1907, *i.e.*, the date of the passing of the Act, any person may apply to the Comptroller General of Patents for the revocation of the patent on the ground that the patented article or process is manufactured or carried on exclusively or mainly outside the United Kingdom. The Comptroller is to consider the application and, if, after enquiry, he is satisfied that it is well founded, and the patentee fails to prove that the patented article or process is manufactured or carried on here to an adequate extent, then the Comptroller may revoke the patent. The provision is not absolute; there are certain modifications and exceptions.

Modifications and Exceptions.

Thus, if the patentee can give satisfactory reasons why the patent is not worked here to an adequate extent, the Comptroller may make no order against him. Again, instead of revoking the patent forthwith, the Comptroller may make an order giving the patentee a certain time within which to carry out the working of the patent to an adequate extent. If the patentee does not comply with the order within the time mentioned, and he can give a good excuse for his failure, the Comptroller may extend the time, but not for more than a year. At the end of the period, original or extended as the case may be, the revocation order will become absolute. There is an appeal from the Comptroller to the High Court of Justice.

By Article V. of the International Convention for the Protection of Industrial Property, it is provided that the introduction, by the patentee, into a country where a patent has been granted, of articles manufactured in any of the contracting states, shall not entail forfeiture of the patent. But the patentee is bound to observe the laws as to working patents of the country into which he introduces the patented articles. The new Act provides that no revocation order shall be made at variance with any treaty, convention, arrangement, or engagement with any foreign country or British possession, and this would include the article just referred to.

How the Act applies to Motor Cycles.

The section was introduced largely with the object of relieving the dyeing industry from a burden which had become very oppressive. Our Continental competitors took out patents here and sold the dyes here, but made them abroad, so that neither the British capitalist nor the British workman benefited by the grant of the patent. But the matter is not without interest to the makers and riders of motor cycles, which are so largely manufactured abroad, and which provide the subject matter for so many patents.

Although this Section 27 is new, it is a logical outcome of the Statute of Monopolies of James I. For that statute, which is still the foundation of our Patent Law, while making most monopolies illegal, specially excepted letters patent "hereafter to be made of the sole working or making of any manner of new manufactures within this realm." It is quite obvious that anyone, whether a Britisher or a foreigner, who patents an invention here, but has it manufactured abroad for sale in this country, is infringing the spirit of the old statute. The establishment of the manufacture compares favourably in importance with the evolving of the invention, as is shown by the fact that a man who sees a new thing abroad is considered to be an "inventor," in the sense that he can take out a valid patent for the idea in this country.

It will be observed that no one can apply for revocation under this section before the end of August next, and then only in respect of patents dated before the 28th of August, 1904, but patents of later date will become subject to attack as time proceeds. It should be remembered, however, that patents granted under the provisions of the International Convention are often really dated nearly or quite twelve months earlier than the date indicated by the number and year printed on the specification, and many of the patents aimed at by the section are filed under the convention.

What the Comptroller may consider working "to an adequate extent" it is, of course, too early to determine, but it is probable that he would not be satisfied with the mere assembling here of parts made abroad unless the essence of the invention consisted in the manner of assembling rather than in the manufacture of the individual pieces.

The main idea is that the patentee's invention shall become part and parcel of the manufactures of this country. And what is manufacturing "exclusively or mainly" outside the United Kingdom is probably best interpreted by the corresponding expression, "to an adequate extent." It would hardly be reasonable to expect a foreign patentee to manufacture "mainly" here an article the bulk of the demand for which necessarily came from abroad. A Russian having a British patent for sleighs could hardly be expected to carry out the manufacture mainly in this country. The Comptroller would probably consider the scarcity of gold (in its natural state!) in this country a satisfactory reason why an American should not work to a preponderating degree his British patent for extracting gold from the ore.

Establish Works or Grant Licences.

The best way for foreign patentees to comply with the section is, of course, to establish works here. Failing this, they should make strenuous efforts to grant licences. The offering of licences could not be construed as manufacturing or carrying out the patented article or process, but the refusal of genuine offers might induce the Comptroller not to make a revocation order, for, it must be observed, the word is "may," not "shall"; the matter is left very much to his discretion. On the other hand, the fact that the inventor had neither attempted to manufacture here nor to grant licenses would tell against him.

The evil is not unlike that of a dealer who takes up an agency not with the object of selling the manufacturer's goods, but in order to "bottle" them—that is, prevent anyone else selling them as rivals to those he prefers to push. Section 27 draws the cork or breaks the bottle, according to circumstances.

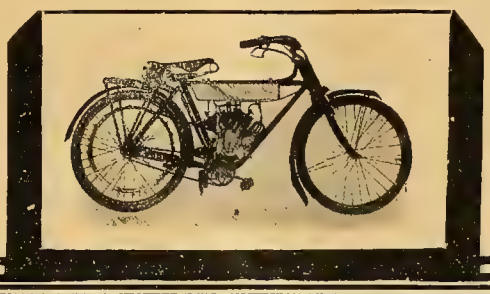
MOTO REVE

"The Motor Cycle" last week said:

"It is a most pleasant little machine to ride, is very silent, gives no trouble, and is just the machine for those riders who desire a lightweight with some reserve power. . . . If the machine continues to give the same satisfaction as it has done up to the present, we shall have no hesitation in recommending it as quite the best of the lightweight patterns that we have yet had the opportunity of riding."

May we send you fuller particulars?

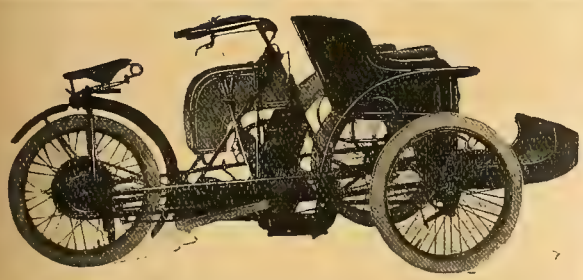
Ask for List C.



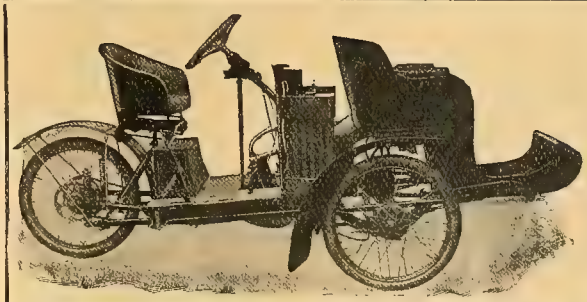
THE MOTOR REVE CO.,
138, Gray's Inn Road, LONDON, W.C.
Liverpool: Central Hall Buildings.

TWO SPLENDID TRICARS.

The "ZENITH," constructed on the "Zenith Bicar" twin-frame spring suspension principle.
The "ZENETTE" Tricar-de-Luxe on the "Zenette" (or "scissors") spring frame (6 springs)
TWO'S COMPANY—AND JOLLY GOOD COMPANY, TOO—ON EITHER.



The famous "Zenith" Tricar, with 6 h.p. J.A.P. twin-cylinder engine, air-cooled, chain drive, two-speed gear, handle starting, Longuemare carburetter, double accumulators, Brooks' saddle for driver, and finest fitments throughout. Price, with coach-built body, **75 guineas**; with best cane body, **72 guineas**. A marvel of value!



The luxurious "Zenette" Tricar-de-Luxe, with 6-7 h.p. J.A.P. twin-cylinder engine, water-cooled, thermo-syphon system, chain drive, two-speed gear, open frame, wheel steering, bucket seat for driver, finest coach-built body for passenger. Present price, **90 guineas** (but shall shortly have to advance, in all probability).

Both are lowest nett cash prices. No deferred payments or exchanges can be entertained, both prices being cut exceedingly fine considering the splendid materials and high-grade workmanship.

ORDERS FOR SPRING DELIVERY MUST BE PLACED AT ONCE!

ZENITH MOTORS, LTD., 101a, STROUD GREEN ROAD, FINSBURY PARK

(SHOWROOM: 119, STROUD GREEN ROAD.) TRIAL RUNS BY APPOINTMENT ONLY.

Sole Manufacturers of the "Zenith Bicar" and "Zenette" Spring-frame Motor Bicycles-de-Luxe, and of the marvellous "Gradua" infinite Change-speed Gear. [Can be fitted to new belt-driven machines (only).]

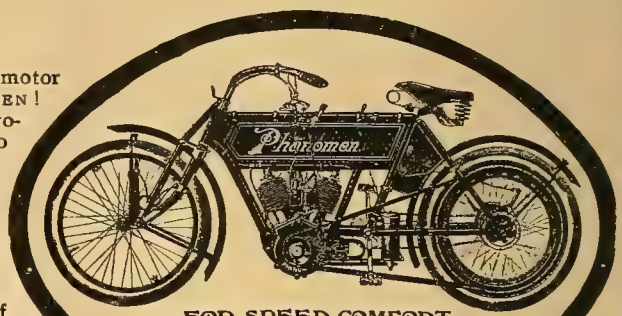
In answering either of these advertisements it is desirable that you mention "The Motor Cycle."

PHÄNOMEN

THE HALL MARK OF MECHANICAL EFFICIENCY.

ONE LEVER CONTROL.

It is astonishing what can be done with a powerful motor cycle in congested traffic, if *that* machine is a PHANOMEN! No other motor cycle has the advantages of the Two-Speed PHANOMEN. You have *no* starting handle to keep, lose, or worry about, no hard work to start up, no running alongside, but just a "push of the pedal" whilst seated. You cannot understand it? We are not surprised! but we are willing to make you acquainted with this "new method of control by ONE LEVER," which actuates in a most simple manner the free engine, the low gear and the high gear, and yet allows "very gradual" engagement of either gear when desired. No shock! no jar! no dog clutches! no sliding pinions! but metal to metal clutch and band brake of large dimensions. Clutch 6½in. diameter for high gear, brake 6¾in. diameter for low gear; double steel hoop. You can keep pace with the most congested traffic without leaving the saddle. You can stop your engine as often as you wish for restive horses, etc., and *start up again without dismounting!* Our machines start up easily *on the road*, as do other machines *on the stand*; in fact, more easily! Trial runs with pleasure. From **£37**, magneto included. Send for list.



FOR SPEED, COMFORT, DURABILITY, SILENCE AND ABSOLUTE CONTROL IN TRAFFIC.

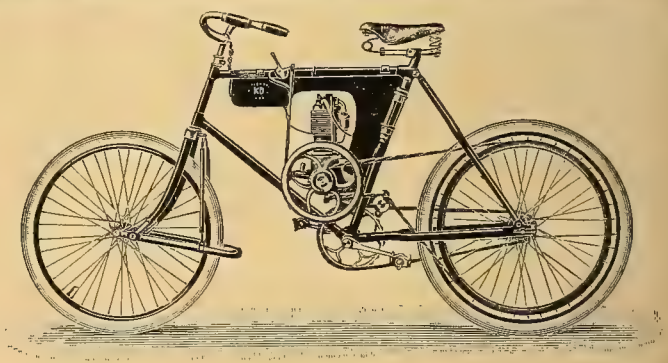
Showroom: 49, King Square, President Street, Goswell Road, E.C.; also at the Service Co., Ltd., 292, High Holborn, W.C.

PHÄNOMEN MOTORS.

"K.D."

FEATHERWEIGHT MOTOR CYCLE

FREE



1¾ H.P. **Weight 69 lbs.**

With a view to advertising our K.D. light weight motor cycle, we are offering to every reader of "The Motor Cycle" an opportunity of acquiring one of these popular and efficient 28 guinea machines absolutely gratis.

This cycle was exhibited at the Stanley Show and created great interest owing to its efficient construction and power for weight.

All you have to do is send for one of our mouth sirens, price **2/6**, and upon receipt of your P.O. we will forward one of our latest mouth sirens (guaranteed the best road clearer on the market), which is in itself full value for the money, together with a descriptive leaflet of the K.D., and an entry form for you to fill up stating the reason why you consider you should be awarded a K.D. free. These forms will be forwarded to Mr. B. H. Davies, the popular writer for "The Motor Cycle," with only a number as a means of identification, and he will judge which is the best reason and award the K.D. motor cycle to the winner. The bicycle can be seen at our showrooms, where all communications are to be addressed:

64a, POLAND ST., W., and 13a, BROAD ST., E.C.

Competition closes May 15th, and the Winning "reason" will be published in "The Motor Cycle," on May 27th.

LEO. RIPAULT & CO.,

Sole agents for the K.D. featherweight.

Valve Lifters for Twin Peugeots.

AT a club run last year I was struck with the number of twin Peugeot engines in use. I was also struck, though not so agreeably, with the fact that on ninety-nine per cent. of these machines where Bowden cable was employed the valve lifting mechanism was not arranged so conveniently as it might have been. It is in the hopes of aiding readers to improve this portion of the control on an otherwise successful and satisfactory engine that I have written the following details. And here let me remark that the fault is not due to the Bowden principle, which gives excellent results if properly applied, but rather to the incorrect design of lifting levers and certain small but important points.

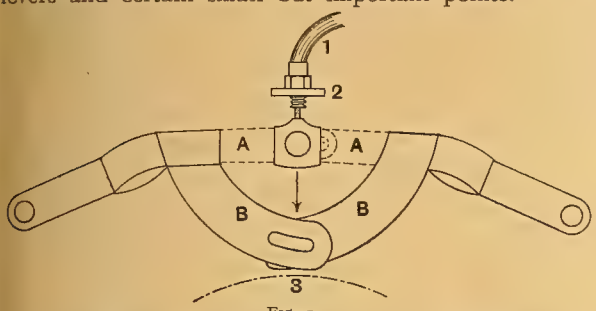


FIG. 1.
1. Bowden cable. 2. Bracket with stop. 3. Top of timing case.
B.B. Parts substituted for A.A., which are removed.

If one looks at the lifters of a twin Peugeot it will be seen that for all intents and purposes they are straight levers of the second order (A, fig. 1). It will also be observed that these levers have only about ¼in. available lift on account of the cramped position of the stop bracket and the carburetter (if the latter is between cylinders) just above the shackle holding the levers.

The consequence of this arrangement is that, owing to stretch, maladjustment, and wear, the valves soon fail to lift, the valves soon become burnt, starting is difficult owing to badly released compression, the hand grips the valve control in vain, and under the strain the cable breaks.

The remedy is the conversion of straight levers into bent ones (B, fig 1). The old valve levers are removed (cylinders must be raised for this!), and curved pieces of metal pinned and brazed on of the shape shown at B B. It is important that this arm is attached to the concave side of the cranked portion, in order that the two resultant pieces may be brought central again, so that power may be applied in the plane of the levers. A rough plan of the arrangement (fig. 2) will illustrate my meaning. If the

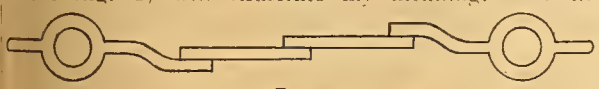

FIG. 2.

metal is brazed on the wrong side of either of the lifters the levers will be found quite a distance apart laterally, and the shackle will not go over them.

The redundant pieces A A are next cut off with the saw, a hole drilled and slotted as in the discarded levers, and the whole filed up to a finish and fit. It will thus be understood that by this means the power arm is lowered by about 1½in., which, of course, means that there is now that amount of effective pull. If it is thought desirable, the bracket and stop may be lowered also, so as to avoid the sharp bend under the carburetter.

The mechanical mind will at once see that by slotting the new levers one above and one below the centre line one lever can be raised in advance of the other. (There are other methods, but this is the best.)

Since adopting this method on my twin I have not only had no trouble as regards valve lifting, but have been able to start easier, keep my valves in better condition, control on one cylinder in traffic, and, moreover, have avoided sharp bends in the cable, so conducive to breakage, and provided for easy repair in the remote event of breakage.

A few remarks as to the finishing details will not take up much space.

I discarded the Peugeot shackle (which is a shackle and nipple combined), and finished the cable in the classical way by soldering on a nipple and burring over the strands. This is threaded into a Bowden shackle, and here, again, I would offer the hint to slot the nipple hole in the shackle by means of saw cuts, as shown in fig. 3. It makes assembling and dismantling infinitely easier, and if the hole in the stop bracket is similarly treated, the whole of the cable and levers can be removed bodily from the engine and worked at with ease on the bench.

FIG. 3.
Method of slotting shackle and stop bracket.

A coil pull off spring between stop and shackle is a refinement, but not a necessity.

I may add that as a rule the existing Bowden cable is long enough to be retained, and may be used by cutting off the necessary length of outer member and drawing the inner wire down to the required point.

The whole improvement need not cost more than a few pence, and it is worth it.

B. RICHARDSON BILLINGS.

Price and Co., 11, Mount Pleasant, E.C., advise us that they have been appointed sole London agents for the Lincoln Elk motor bicycles. Samples of these machines can be examined at the above address.

How often one sees under the heading of "Hints and Tips" and "Mechanical Notes" a tip informing readers how to detach piston rings. The information usually given is to obtain two or three strips of tin and slide the rings over the tin when the strips are spaced out at equal distances around the piston. This does very well as a makeshift, but why go to all that trouble when a little tool can be supplied for a few pence which will detach any small ring? The tool in question is in shape like a pair of ordinary gas pliers, but the jaw movement is reversed, that is to say, the jaws when inserted in the slot of the piston ring expand under pressure and the ring can be removed in a second. It requires a little care in expanding the ring to prevent breakage, but anyone without the slightest mechanical knowledge can instantly detach a ring with this instrument. If any reader desires a pair of these pliers we shall be pleased to tell him where they can be purchased.

CURRENT CHAT.

Special Features.

HOW TO WIN HILL-CLIMBS (Illustrated).

THE CHOICE OF GEAR RATIOS.

The Demand for Motor Cycles.

So far from there being any falling off in the demand for motor cycles, it is interesting to note that the Rex Motor Mfg. Co., of Coventry, are advertising for experienced mechanics for a night shift to cope with the demand for Rex motor cycles.

Police Trap.

A correspondent informs us that a trap is now working on Hadley Common. It begins at a point opposite a red building about twenty yards on the London side of Hadley High Stone, and extends for about one-fifth of a mile, or half-way across the common.

Cambridge v. Oxford.

On May 30th the Cambridge University M.C.C. and the Oxford University motor cyclists will meet in a match either at Sharpenhoe or on the Brooklands Track. This meeting, we presume, is to be made an annual affair, after the style of the 'Varsity Boat Race.

Speed Limit on Hills.

The ten miles limit on the Sevenoaks Road through Bromley is now in operation. The warning boards are of an original and improved type, viz., plain white discs under which in lettering, red on white, appears "ten miles." There has been a marked diminution in the speed through the town since the regulation came into force, says our local correspondent. So far no one has been stopped, but the police are active.

Twins and Two Speeds an Advantage.

Why the regulation should apply to the steep Swan Hill, on the Beckenham Road, is beyond comprehension. But a board is erected on the finishing bit of 1 in 9, also the Beckenham side. The hill, which has a swan neck bend, is narrow at the top, and many riders of single-geared machines will have to walk their machines if they don't take the initial part at good speed. Two speed and twin-cylinder machines will be at a big advantage. Mason's Hill. too, on the London Road, is tricky to tackle at slow speeds.

An Ambitious Tour.

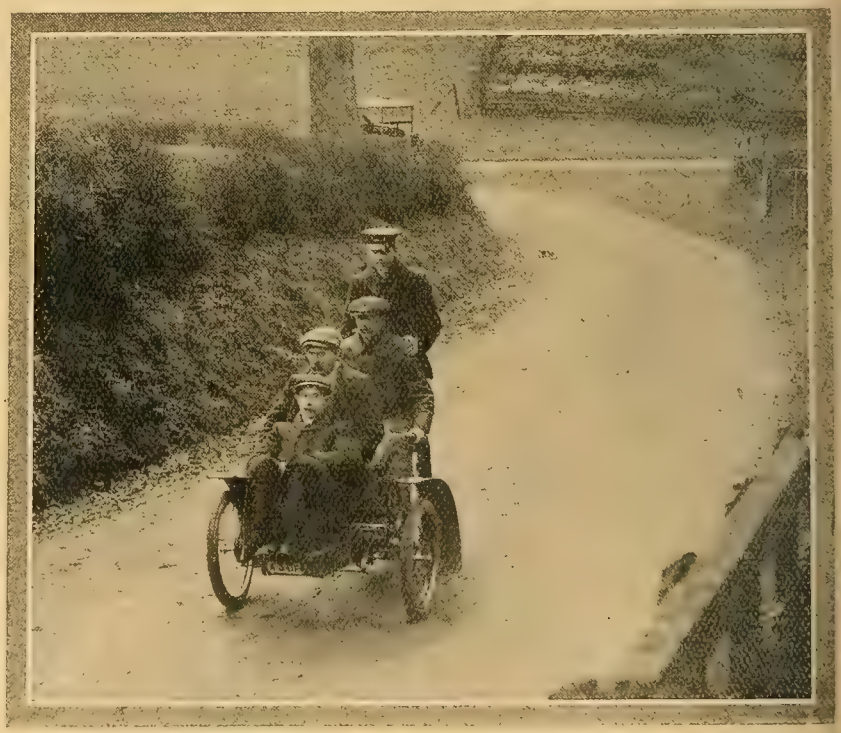
A few weeks ago a gentleman named E. M. Baxter, agricultural editor of *The Buenos Ayres Herald*, left England on a business tour which will embrace many Continental cities and extend, if all goes well, to the northern portion of Africa. Before Mr. Baxter left England we arranged for him to contribute an account of his doings, also photographs of interest to motor cyclists depicting motor cycling scenes in the countries through which he will pass. Through the courtesy of the Triumph Cycle Co., Ltd., we have seen a letter which Mr. Baxter has written from Cremona, Italy. From this letter we gather that the weather and road conditions have been rather unfavourable. The roads through France were bad enough, but in Italy they were worse. The total distance accomplished at present per motor cycle is about 1,690 miles, during which there has been no stop due to any fault of the machine. Owing to the fearful state of the roads he has been obliged to resort to the train on occasions. It is interesting to note that Mr. Baxter is not an experienced motor cyclist, or to be more correct, he was not when he first essayed the Triumph machine at Coventry. He had ridden a pedal bicycle, but had never previously bestridden a mechanically-propelled machine.

An American Tricar in the End-to-end.

Mr. T. K. Hastings, who it will be remembered was a successful competitor in the Six Days' Trials last year, will possibly bring his light Indian tricar to England for the 1908 competition. This tricar has a 5 h.p. twin-cylinder engine, and weighs 250 lbs. only. Mr. Hastings says he should like to see how it will run "on really good roads."

Unrolled Stones Bad for Tyres.

At this time of the year small patches of unrolled stones are encountered on the roadway. For the benefit of novices who have consideration for their tyres we may say that the best way to pass over them is to run almost up to the patch with the engine firing and then raise the valve lifter, so that the machine rolls over the stones. When stretches of road are under repair, and the steam roller is at work, it is advisable to dismount and wheel the machine on the pathway. Of course, it is better to avoid stones altogether if possible.



A twin-cylinder Brown tricar, driven by R. M. Brice, climbing Red Lion or Water End Hill, Hemel Hempstead, with four persons up.

ring Issue on May 6th.

The first issue of *The Motor Cycle* published in May will be a special spring number.

The Motor Union and Motor Cyclists.

A sub-committee of motor cyclists has been appointed to consider the relationship between motor cyclists and the Motor Union.

Motor Cycle Race at Brooklands.

The news that the Brooklands A.R.C. will include the first motor cycle race in the Easter programme has been received with great satisfaction on all sides. We have heard of two or three enthusiasts who intend entering immediately the conditions are made known. Let us hope the two 16-20 h.p. racers exhibited at the Stanley Show will be allowed to try their paces.

Fun on the Wheel.

Under the heading of "Hum of the Wheel" in *The Notts Evening Post*, the following humorous paragraph appears under the name of C. W. Brown: "I must say that I fully appreciate Mr. Hooydonk's position with regard to the adoption of two-speed gears on motor cycles, but I am afraid that it is the voice of one crying in the wilderness. The truth is that speed, and speed only, is the cry of the motor cycle press. I admit the intoxicating effect of speed; I have suffered from it, because on a high-powered car speed is fascinating. But on a motor bicycle on ordinary roads it is not, for the simple reason that it is next to impossible to sit the machine with any degree of comfort."

The Open Hill-climb on April 4th.

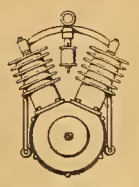
Entrants only for the Lewisham A.C. hill-climb on the 4th prox. are being advised at present of the venue of the hill, as a large crowd of spectators is not desired. We shall publish the name of the hill in our next issue. Entries for the contest finally close on Saturday next, the 28th inst., to the hon. sec., H. B. Renner, 31, Kidbrook Park Road, Blackheath, S.E. It is to be hoped that more entries will be received for the sidecar and lightweight class. The weight limit in the last mentioned class is 95 lbs.

Cycle Race Meeting Abandoned.

The race meeting promoted by a contemporary at the Stadium, Shepherd's Bush, for Saturday, May 9th, has been abandoned.

A Miniature Model of an Engine.

Mr. H. Rem Fowler, of T.T. fame, has sent us for inspection a most ingeniously constructed model of a twin-cylinder Peugeot engine. The tiny model measures $\frac{7}{8}$in. by $\frac{3}{4}$in. over all, the illustration showing its exact size. It is a working model as far as the engine pulley, cams, and valves are concerned, and the whole was turned on a clumsy brassfounder's lathe with 6in. centres, the parts being so small that at times Mr. Fowler says he could hardly hold them for working, and several of them got lost. The exhaust valve springs are made of hard drawn German silver wire. The carburetter is an exact imitation of a Brown and Barlow, and there is a chain sprocket on the half-time shaft for driving the magneto.



There are no flywheels or pistons, but Mr. F. tells us that he has been asked several times by motor cyclists who have examined it if there are such parts inside the model, and judged from the outward appearance that it possibly would work if attached to a gas tap. The weight of the model is considerably less than half an ounce, and it is gilded all over and fitted with a ring for attaching to the watch chain. We must say that we return this piece of clever work with the greatest reluctance, especially as the maker informs us that he has no intention of making another.

FUTURE EVENTS.

Mar. 21-28—Cordingley's Motor Show, Agricultural Hall.
" 28—M.C.C. Opening Week-end Run to Brighton.
April 4—Lewisham A.C. Open Hill Climb for Motor Cycles
" 16-20—M.C.C. Easter Tour.
" 18 and 20—Brooklands Car and Motor Cycle Races.
" 19 (Easter Monday)—Lincolnshire M.C.C. Hill Climb.
" 25—A.C.U. Quarterly Trial.
May 2—M.C.C. Members' Hill-climb.
" 9—Brooklands Motor Races.
" 9—Essex M.C. Open Hill Climb.
" ——A.C.U. Annual Hill Climb.
June 5-8—M.C.C. London-Edinburgh Run and return for Schulte Cup Competition, and special cup for motor bicyclists.
" 27—M.C.C. Inter-team Trials for "The Motor Cycle" Challenge Cup.
" ——A.C.U. 24 Hours Ride.
" ——A.C.U. Land's End to John-o'-Groat's Six Days' Reliability Trial.
July 25—Motor Cycling Club's Petrol Consumption Tests.
Aug. 3-4—M.C.C. Run from London to Land's End and Back for Charles Jarrott Cup.

The Laviosa Autocicletta.

Quite a novel type of motor bicycle was on show at the Turin Motor Exhibition last month, and we give an illustration of the 1907 model herewith.

The machine has four wheels, although two are miniature ones, and are only used when getting under way, and as a stand. Directly equilibrium is assured the two side wheels can be put out of action by depressing a pedal. The single cylinder engine transmits power through two friction clutches, each with its chain to the back wheel, the low gear sprocket being attached to the spokes on one side of the wheel, the high gear one on the other. The 1903 Autocicletta, which is an improvement on the machine illustrated, is the result of two years' private experimenting, and is sold at £38. Dual ignition can be had if desired, also belt drive and fan cooling. Other details which will be noticed are an open frame, roomy bucket seat, spring forks, and handle starting.

Preparing for the Opening Climb.

The Westerham Road and hill was in grand trim at the week-end, and a contributor noticed several motor cycles being tried on the hill in preparation for the opening climb. At River Hill, too, several riders were noticed making trial runs, it being hinted that the venue of the L.A.C. climb a week next Saturday is in the near vicinity.

Accidents in Paris.

The number of persons killed in the Paris streets during 1907 due to traffic accidents is stated by *La Nature* to be: Trams 85, automobiles and motor cycles (not divided) 46, horse-drawn vehicles 88, motor omnibuses 9, pedal bicycles 5. It is not stated whether all these unfortunate people were run over or whether any of the accidents were due to collisions with other vehicles. It would be instructive to know the proportion of motor cycle accidents.

The First Long Distance Trial in 1908.

The first long-distance trial this year is the one promoted by the North-west London M.C.C. to Coventry and back, on May 23rd next. The course totals 216 miles, to be covered in twelve hours, and silver cups will be awarded to the successful competitors.

The Motor Cyclists' Ideal.

We are exceedingly glad to note the hearty response to the circular issued last week. Every post brought us shoals of replies, and our plebiscite is sure to prove most interesting when published.

American Records.

Our American correspondent advises us that the record made by W. H. Wray, jun. (44$\frac{2}{5}$s.), for the flying mile at Ormond Beach, Florida, January 25th, 1907, is recognised by the Federation of American Motor Cyclists. The record made by G. H. Curtis (46$\frac{2}{5}$s.) for the same distance was made in competition. In an early issue we hope to publish a complete list of American records as recognised by the Federation of American Motor Cyclists.

International Auto Cycle Tourist Trophy Race.

In our last issue we published a paragraph stating that Mr. M. J. Schulte had offered to present one gold medal each to the second and third in the single-cylinder class in the above race. The information was culled from the *R.A.C. Journal*, and proves to be only partly correct. The donor of the medals informs us that they are presented to the A.C.U. for *private owners only* riding single-cylinder motor bicycles in the T.T. Race next September or October.

CLUB NEWS.

Motor cyclists at the opening run of the Coventry M.C. to Stratford-on-Avon on Saturday last. Some sixty members and friends attended.

The Worcestershire M.C.C.

The above club has decided to hold a reliability trial on Easter Monday. The start will be made from headquarters at about 9 a.m. for Kington (Herefordshire), lunch and control here, return over same course, distance 105 miles.

Sutton Coldfield A.C.

A general meeting of the above club was held at headquarters, Royal Hotel, on Friday evening last, to consider rules and appoint officers. Mr. John C. Shannon was elected president; Mr. F. H. Finney, vice-president; Mr. Seymour Smith, captain; Mr. G. E. Jones, vice-captain; and Mr. Howard R. Lane, of The Beeches, Anchorage Road, Sutton Coldfield, hon. secretary. The opening run has been fixed for the afternoon of April 25th, and will constitute a reliability trial.

The Motor Cycling Club.

Members are again reminded of the opening run to Brighton on Saturday and Sunday next. Start from Purley Corner at 3 p.m. on Saturday; tea at the Red Lion, Crawley. The headquarters at Brighton are at the Old Ship. After dinner there will be an impromptu concert, so members are requested to bring their music with them. Arrangements will be made for lunch on the return journey at Burford Bridge Hotel. The best route to Purley Corner from the north-west of London is *viâ* Wimbledon Common, Mitcham Common, and Beddington Lane.

The centre for the Easter tour has been fixed at the Red Lion, Salisbury.

Newcastle and District M.C.C.

The annual general meeting was held at the Barras Bridge Hotel on Wednesday last, a numerous gathering being present. Mr. G. Hawkins was elected to the chair. The hon. sec., Mr. S. W. Carty, presented his report of the year's working of the club, which gave a list of the competitions already held, and foreshadowed the events for 1908. The membership is now close on 100, being over thirty more than twelve months ago. The resignation of the hon. treasurer, Mr. E. L. Bates was received, he being unable to continue in office owing to pressure of business. The following are officers for the current year: Hon. sec., Mr. S. W. Carty; hon. treasurer, Mr. Louis Rosenvinge; hon. solicitor, Mr. E. L. Bates; committee, Messrs. Hawkins, Crosier, F. Mallett, Nicholson, H. Bell, Austin, J. P. Forster, Atkinson, Outwin, and Rev. W. R. Yates.

The Hon. Treasurer presented his report and balance-sheet, which showed a balance of over £10 in hand.

It was agreed to form a new class of membership, to be called associates, annual subscription 5s., and they to be affiliated to the Auto Cycle Union with all its rights and privileges. The opening run has been arranged for Richmond on Good Friday, to meet the Leeds, Sheffield, and Bradford Motor Cycle Clubs.

Purley and District M.C.C.

This newly formed club has now started its weekly runs, and riders in the district are invited to join. On the first run to Crawley, some fifteen members attended. The subscription to the club has been increased to seven shillings and sixpence, including affiliation fees to the Auto Cycle Union. The hon. sec. is Mr. W. Borer, Wellmead, Purley.

Essex M.C.

The opening run takes place on Sunday, April 5th, to Witham, and it is hoped that a large number of members will turn out. A start will be made from the Castle Hotel, Woodford Green, at 10.30, and lunch will be arranged for at the White Hart, Witham, at 1.30. Will those intending to be present please notify the secretary in order to facilitate arrangements? This run will provide an excellent opportunity for introducing new members.

Coventry M.C.

There was a good attendance at the A.G.M. of this club on Wednesday evening last, presided over by Mr. V. A. Holroyd. After the report and balance-sheet had been adopted (the latter showing an income of £374 11s. 8d. and an expenditure of £267 17s. 7d.), the question of affiliation was put to the meeting. On the proposition of Mr. Victor Riley, seconded by Mr. W. F. Grew, it was unanimously decided to affiliate to the R.A.C. and A.C.U. Owing to the increase in the membership of the club, which now numbers 104, several additional members were elected on the committee. During the year it was decided to promote several club competitions, and in May next a long-distance run to Holyhead and back will be held.

It was announced at the meeting that the United Motor Industries, Ltd., would again present a cup for competition.

Cambridge University M.C.C.

The above club held a hill-climbing competition on Saturday, March 14th, at a hill about fourteen miles from Cambridge, near the village of Croydon. The hill has an average gradient of one in six. There was a very good attendance. W. H. Lees, of Trinity Hall, on his own design 7-9 h.p. Peugeot made both his ascents in 20s., equal to forty-five miles per hour, and thus doing the fastest time of the day. P. Q. Heyn on a 5 h.p. twin G.B. did second best time. The results, however, were worked out by the formula, $\frac{W}{C \times T}$. In the single class, the following is the order of merit: 1, W. G. Ross (Trinity College), on a 3½ h.p. 1908 Triumph; 2, C. H. C. Smith (Trinity College), on a 2¾ h.p. Clyde; 3, W. E. de Souza (Clare College), on a 3½ h.p. Minerva. In the twin class: 1, E. D. Dickson (Emmanuel College), on a 1908 twin Vindec; 2, J. M. Oakey, on a 1907 twin Vindec; 3, P. Q. Heyn.

The President (Mr. J. P. Stokes) says: "We are glad to see the town have followed our example and formed a motor cycle club, and we wish them every success."

THE A.C.U. COUNCIL MEETING.

A LONG BUT SUCCESSFUL MEETING—SCOTLAND AND IRELAND TO BE INVITED TO JOIN THE A.C.U.

THERE was a good attendance at the annual meeting of the Auto Cycle Union Council, held at the Imperial Restaurant, Regent Street, W., on Saturday last. Mr. Robert Todd was in the chair, and there were representatives from all districts.

Mr. Todd referred to the correspondence between the A.C.U. and the M.U. regarding the agreement, and stated he had seen Mr. Rees Jeffreys, and believed that in a short time the matter would be settled. He thought they might now cease reforming, and settle down to useful work. (Hear, hear.) As to taxation, they had approached the Chancellor of the Exchequer, and thought they had had a very good hearing, and although they had held their end up, it is evident that the Chancellor wants money, and does not look favourably on the idea of taking with one hand and paying back with the other.

Mr. Carty, Newcastle-on-Tyne M.C.C., raised the question of the penalty run, and said that they were very keen on it up North. It was explained that the event filled badly as regards the Midlands.

Mr. Mayo, Yarmouth, pointed out that the alterations of date had upset their arrangements. As it is very evident that such a contest is required, it was made an instruction to the committee that another contest be considered for this year.

In respect to the private members, Mr. J. H. Hall, Sheffield and Hallamshire M.C.C., asked whether the private members were not too well catered for. He thought they should go more for clubs, and not trouble so much about social events. He thought there was no reason for the paragraph in the report which stated that the agitation had had a detrimental effect on the private membership.

The Agreement with the R.A.C.

Mr. Carty thought the committee should not have made new arrangements with the R.A.C. without calling a Council meeting. They had signed the agreement, but he did not agree with it.

Mr. Todd: You are here under that agreement, and if you repudiate it you have no right to be here. The committee had (continued the Chairman) had the expressions of the meetings at Lincoln, Nottingham, and London, and thought that they were fairly well aware of the wishes of the Union, and had acted on those opinions. They had made a very excellent bargain, and the A.C.U. was now in a very strong position. They and the M.U. would shortly have any differences there might be amicably settled. He referred to a recent circular signed by some gentlemen present, and thought it had been raised in the interests of a certain body.

Mr. Wilkinson said that, as secretary of the club which called the Lincoln Conference, and as a member of what had been termed the Reform Committee, he had been in close touch with what had been done, and he was convinced from what he had seen of the arrangements made that the A.C.U. had done very well indeed. He had the honour of seconding the resolution which gave them the new arrangements, and he could answer for it that the A.C.U. had taken into account the basis of the conferences held, that the motor cyclists desired to manage their own affairs, and to have complete self-government. That was the bedrock of it all, and that they had got. Except for the government of the sport of motoring, which remained with the R.A.C., as the Jockey Club of motoring, there was no veto or over-lordship, but they did whatever they cared to do, and were not interfered with.

Mr. G. F. Sharp ably sketched out the negotiations that had been carried on, and showed that the R.A.C. had been most sympathetic and helpful.

The report recorded the thanks of the Union to the R.A.C. for the great assistance received from the parent body, and to Mr. Orde, the secretary of the R.A.C., for his help and advice on many occasions. The many honorary officials who have assisted in the past were also thanked.

The Balance Sheet.

Mr. C. A. Smith, the treasurer of the A.C.U., presented the balance sheet, which showed a slight deficit, viz., £13. The Treasurer stated he had at the present moment £500 in hand.

Mr. H. G. Cove seconded.

Mr. Hall wanted fuller figures.

Mr. Carty wanted the figures for the private members and for the clubs to be kept separate.

Mr. Cove supported this, as then it would be seen what the private members really did for the Union.

Mr. Carty asked as to the medals sent out to provincial clubs.

Mr. Smith suitably replied to the various queries raised, and the accounts were passed. It was agreed to endeavour to separate the figures for the private members.

The Chairman then read the new agreement made with the R.A.C., and explained the advantages obtained. He showed that the A.C.U. was £20 to the good over the new arrangement, and was in a very strong position.

Mr. H. Mayo could not see why they should leave one car body and join another. The other agreement had been torn up. What was to prevent this also being torn up? There was, he submitted, plenty of time to call the Council together. They had nothing against the committee, which had done the best possible, but they were jealous of their honour, and some of them had refused to sever their agreement in a summary fashion.

Mr. S. H. Fry asked was the agreement in force?

Mr. Todd: Yes. It was required to be dealt with early, and that was why the committee had acted.

Mr. G. H. Sharp showed how the matter stood. He said they had to jump and sever their connection with the Motor Union, which had been unsatisfactory from the start. They had had a hard fight to get anything from them, and if it had not been for such friends as Mr. Hele-Shaw and others they would have been in an even worse position. They had to pay, but got precious little for it, and the M.U. could not get away from the car idea. He had been on the M.U. committees and had seen it from the inside, and could say that the arrangements were most unsatisfactory. They of the A.C.U. had, he was certain, done the right thing.

Mr. Hall re-affirmed his opinion that a Council meeting should have been called.

Mr. Carty again expressed himself against the veto of the R.A.C., and spoke contemptuously of the amount of money they were obtaining from the R.A.C.

Mr. Wilkinson defended the committee, and said that they had simply carried out the decision of the Lincoln Conference.

Alterations to the Rules.

The necessary alterations to the rules were then proposed by Mr. Victor Hart. Rule 18 was altered to the effect that clubs joining the A.C.U., should first pay their fees.

Mr. Hall opposed this, and Mr. Carty seconded.

Mr. Smith explained that it was simply as all clubs did, they wanted a man's money before they made him a member.

Mr. Todd explained that the inclusion of the words was due to Mr. Hall himself, who in one of his many manifestos or circular letters had suggested that a club could affiliate and come and vote, then if it was not suited it need not pay.

Mr. Hall denied this interpretation, but Mr. Todd declared that was what the letter said.

Mr. Hall's proposal was defeated.

The only other alterations in the rules of moment was the increase of the committee.

Mr. C. D. Rose, M.P., was elected president; and the Hon. A. Stanley, M.P., the Marquis de Mouzilly de St. Mars, and Messrs. C. V. Boys, H. L. Callendar, E. Dangerfield, S. F. Edge, M. O'Gorman, Col. H. C. L. Holden, G. F. Sharp, Dr. Hele-Shaw, R. Todd, and A. J. Wilson, vice-presidents.

Mr. Todd was re-elected chairman, and Mr. C. A. Smith vice-chairman and treasurer.

Messrs. S. F. Beevor, E. M. P. Boileau, R. Todd, Mallam, H. B. Renner, J. Lyons Sampson, G. F. Sharp, C. A. Smith, A. Brown, and Bowley were elected to represent the R.A.C. members; and Messrs. J. G. Brooker, R. Chatterton, H. G. Cove, H. P. Harding, W. Pratt, A. G. Reynolds, A. Sharp, T. D. Blanch, R. J. Chapman, Getting, and Nelson to represent the private members.

For the affiliated clubs the following clubs were nominated for representation on the committee: Newcastle, Lewisham, Lincolnshire, Essex, N.W. London, Motor Cycling Club, Sheffield and Hallamshire, Bradford, Richmond, Yarmouth, Manchester, Cambridge University, Western District (London), Cardiff, West Essex, Birmingham, Bristol, Coventry,

The A.C.U. Council Meeting.—

Worcester, Hull, Scarborough, Walthamstow, and Brighton. On coming to the vote the Sheffield, Western District, and Brighton Clubs were defeated.

Mr. A. C. Pemberton, in a good speech, proposed to urge the Stanley Show authorities to consider the importance of the motor cycle movement, to give motor cycles increased publicity in their advertisements, and to devote more attention to them in their show. This was adopted.

Mr. Hall's sixteen proposals were then dealt with.

The proposal to secede from the R.A.C. was overthrown.

Mr. Sharp, Mr. Todd, Mr. V. Hart, Mr. Wilkinson, and others declared for the retention of the arrangement with the R.A.C., and emphasised that it was wholly beneficial, and that the A.C.U. had complete self-government.

Mr. V. Hart stated that Mr. Hall was only representing himself, and was not speaking for motor cyclists as a whole.

This brought from Mr. Hall an angry repudiation, and a statement that he had had a lot of correspondence with clubs.

Mr. Hall's proposal to allow the members to the committee to elect a substitute was defeated, largely on the grounds that there must be some continuity. The three proposals as to the payment of the fees was withdrawn.

The proposal that the existing agreement between the A.C.U. and the Scottish Cyclists' Union be terminated so as to enable the motor cyclists in Scotland to join the A.C.U. found a seconder in Mr. Wilkinson, who stated that when the Lincoln Conference was being arranged he found that the Scottish motor cyclists were very anxious to come into the A.C.U., and Mr. Hall showed that the centre scheme would enable the necessary arrangements to be made.

Mr. Todd thought the scheme would not work, for when Scottish motor cyclists were strong enough they would desire to break away.

On being put to the vote it was, however, carried, as was a similar one in respect to Ireland, so that if the negotiations prove successful, the riders in Ireland and Scotland will join their English brethren.

The proposal to arrange an active campaign in respect to taxation was agreed to.

The proposal for a new class of members with limited advantages at a small subscription was defeated.

Mr. S. H. Fry supported it, believing that it could be a sort of R.A.C. associate scheme, and prove successful.

Though the proposal was strongly pressed, it failed to win sufficient votes.

Mr. Carty's proposals were then proceeded with.

His proposal to start the centre scheme was seconded by Mr. Wilkinson, who had a similar proposal on the agenda Both urged that the scheme should be given a trial and on the suggestion of the seconder it was decided that the scheme should be started, and extended when found practicable. It was urged that the clubs would assist in forming new centres, and thereby the unwieldiness of the present Council would be lessened.

Mr. Carty was also successful in his proposal for inter club competitions within a twenty-five miles radius being run without a permit; but his proposal that the riders need not take out a license was defeated.

Mr. Carty's proposal to defray the fares of the councillor and committeemen residing more than thirty miles from the place of meeting met with much opposition.

Mr. Wilkinson was seconder, and withdrew a similar proposal in his name. It was stated that it would cost a enormous amount, but when it was made clear that the councillors under the present scheme were not included, and the seconder had stated that on the N.C.U. the fares of the committee averaged under £50 a year, it was decided to refer the question to the committee, with a recommendation to confine the distance to fifty miles.

Mr. Wilkinson having thrown in some of his proposals with those of Mr. Carty, his remaining one, seconded by Mr Renner, that the Council meet four times each year, alternately in London and the provinces, was carried.

A very hearty vote of thanks to Mr. Todd for his service at this lengthy meeting was then passed.

The Agricultural Hall Show.

OWING to special arrangements with other show promoters, only a very limited number of motor cycles may be shown at Cordingley's Motor Exhibition; therefore the number of items of interest to motor cyclists is exceedingly small. Only four complete machines are to be found in the building, and comparatively few firms are showing fittings and accessories which could be utilised by our readers. Still, to the enthusiast a visit is always worth while, and in these days of quick transit by "Tube" an hour spent in the hall will not altogether be wasted. Moreover, after the show has been opened for a few days, further exhibits may arrive, and thus render it more attractive.

In the main hall the F.N. Motor Agency, 106, Great Portland Street, S.W., stages two latest pattern F.N.'s, the 1¾ h.p. lightweight and the 4½ h.p. four-cylinder, two machines the excellence and good running of which are well known.

Douglas Cox, West Norwood, S.E., shows a twin-cylinder Adler, which follows the lines usually pursued by German manufacturers. It possesses a two-speed gear on the engine-shaft, which in outward appearance resembles the N.S.U., and has the spark advance controlled by a twisting handle and Bowden wire. The adjustment of the air and the arrangement of the control are also well worth inspection. The ignition is by high-tension magneto driven by a chain protected by a cover. Douglas Cox has also a latest pattern Douglas motor bicycle, one of the few twins with horizontal opposed cylinders, provided with vertical valves, and built by Douglas Bros., Bristol. It is a remarkably nice piece of work, having direct transmission, by means of a rubber belt, without any jockey pulley, and a Bosch lightweight magneto.

H. J. Harding, 211, Northumberland Park, N., is showing accessories in the Gallery, and is to have later two of the new lightweight Werner motor bicycles, but at the time this report was made they had not materialised. The chief item in the remainder of Mr. Harding's exhibit is the push-on or Eclair tyre connection—a thoroughly sound idea.

On one stand in the navigable balloon section, J.A.P. motor cycle engines are shown from 16 h.p. downwards. These engines appear to be attaining the same vogue in the aeronautical as in the motor cycling world.

W. and R. Jacobs, 39c, King William Street, E.C., who excellent electric motor cycle lamps have been recent described in *The Motor Cycle*, exhibit a capital selection electrical accessories, the most lately introduced of whi consists of an eight-volt accumulator for lighting mot cycle lamps of small dimensions.

Prested and Co., Elthorne Road, Holloway, show the wel known and well-tried Prested accumulators, coils, etc.

Carburation, Ltd., Byron House, Fleet Street, show G.J carburetters and the Gillet-Lehmann petrol economiser. Sin the carburetter was described in this journal on Septemb 18th, 1907, no structural alterations have been made, but w learn that to ensure the most absolute accuracy the device now manufactured by a firm of scientific instrument makers

The Ara Materials Patents and Manufacturing Corporatio 83, Chancery Lane, W.C., show the Ara vulcaniser, whi works on the cold process system. With it a repair is e tremely simple to carry out. When done, it is claimed t be absolutely permanent, and it takes less than ten minut to effect, and it is moreover suitable for repairing cuts gashes in a cover as well as for mending a damaged tub The device can be made to fit into a small area, so that the makers do as they suggest, and fit up a special outfit f motor cyclists, it should be a great boon.

Hurst and Middleton, Windsor Road, Lower Holloway, N (a firm which makes a speciality of all kinds of repairs), hav lately been joined by Mr. Sharpe, the inventor of the Univers silencer, which is shown here. This silencer, it will be remem bered, gained highest honours in the A.C.U. silencer tria held last year. Sharpe's piston ring remover is also show

Chas. Baker, 271, High Holborn, and Samuel and Co Ludgate Hill, show some excellent examples of motor cyc clothing.

On the stand of the Maison Talbot, Long Acre, W.C., whic together with the other accessory stands is in the Gallery, the Hay's electric vulcaniser. This device, which is very simpl worked off an ordinary ignition accumulator, is manufacture by the County Chemical Co., Birmingham.

HINTS AND TIPS FOR MOTOR CYCLISTS.

By Road Rider.

(*Continued from page 205.*)

DRIVING A MOTOR BICYCLE (continued).

CONTROL OF THE ENGINE.

For any given speed of the road wheels there is one right position of the spark lever when battery ignition is used and several wrong ones. These correct positions are soon learnt by practice, and are the secret of good hill-climbing. When they are known and used the engine runs more smoothly, quietly, and economically than with any other setting of the spark for the same road speed. (With magneto ignition the lever is generally placed nearly fully advanced and only slightly retarded on very steep hills.) Most of the following remarks apply to magneto or battery ignition, but it must be borne in mind that with magneto ignition the spark lever cannot be retarded in the same way that it can with battery ignition.

Example: 20 m.p.h. desired speed, engine 3½ h.p., gear 4½ to 1, road flat. Desired speed may be attained in two following ways:

(1.) Spark two-thirds retarded, throttle wide open, half extra air. Dull heavy explosions, pounding sensation, uses lot of gas, heats engine.

(2.) Throttle almost shut, spark nearly fully advanced, air nearly fully open. Gives light, smooth, quiet, purring explosions, keeps engine cool, economises gas.

Or tabulate control levers thus:

Throttle—hot, noisy, and expensive.

Spark—cooler, quieter, and very cheap.

Air—coolest, quietest, and, thank goodness, costless.

For any given speed we want the spark as far forward as possible, provided there is no knocking. The throttle as nearly shut as possible, and the air set to suit the other two, but as wide open as it will go without lowering the speed below the desired point.

Therefore, first set spark lever with throttle well open; put it so that the machine travels a little over desired pace, then close the throttle till exact pace desired is attained; then open air until to open it further would slow the machine or cause misfiring.

Starting out to average 20 m.p.h. along a deserted road I should set spark two-thirds forward, open throttle wide, and shut off the air. Push machine along till fair pace is attained, drop valve, and if inclined to take risks mount instantly the engine fired. If not the moment engine fired, raise valve, mount instantly, and drop valve the moment the foot is safely on the pedal. Arrived in the saddle, instantly give a little more air to prevent engine stopping for want of it, and the speed would immediately rise to over twenty, the throttle being too far open. Closing this down the speed would fall to twenty; I should then carefully adjust the air to that point at which the engine gave most power, and perhaps open it just one notch farther than this, for the sake of coolness and economy.

On arriving at a down grade that is sufficiently steep, lift the exhaust valve switch off ignition and freel down; if a very long freel is in prospect, half open throttle and open air fully to scour and cool engine If no switch fitted, have throttle eighth open and air fully open; this should weaken mixture sufficiently to make it non-explosive in silencer while valve is lifted. It is inadvisable to close throttle entirely.

If the grade is too easy to coast at reasonable speed, fully advance ignition, and close throttle nearly down, giving air to suit.

If grade be dangerous, approach summit slowly, lift valve and coast, arresting with brakes as appears wise. If very steep, close the throttle at the top, or switch off, so that engine compression may be used as an extra brake by dropping the valve at intervals.

HILL-CLIMBING ON MOTOR BICYCLES.

The point in driving which takes longest to learn, and is most pleasurable in learning, is the setting of the spark in hill-climbing. This comes slowly in ordinary riding, and the best method is to spend an afternoon on a hill which is almost beyond the powers of the machine. I have more than once failed low down on a hill by sheer bad driving, and ten minutes later roared up to the top at a good speed. There is a great deal in knowing the machine. In my novitiate I owned a single-geared belt driven tricar which I could never drive solus up a certain hill. In two months I could drive it up every time with a heavy passenger. No one, unused to the machine, ever succeeded in getting it up the hill without a passenger.

The spark can never be safely advanced on steep up-gradients; therefore, start every steep hill at maximum road speed, or at a speed sufficient to carry you up. Remember that the full power of a 3½ h.p. engine is developed at 1,500 to 1,800 revolutions per minute. At 500 r.p.m. it may only give ½ h.p. When the power of the engine is insufficient to allow climbing of steep hills with the spark fully advanced all the way up, the art lies in the judicious retardation of the spark. Sudden and violent alterations of its setting are fatal and ensure failure. As the engine slows, retard the spark a notch or so at a time, and discover by experiment whether it is helpful to cut off some of the extra air simultaneously.

The points, therefore, are:

1. Start a steep hill at full speed, *i.e.*, full spark advance, throttle two-thirds open, air set to match.

2. Correct the first almost imperceptible slowing by opening the throttle to its full extent.

3. When the machine slows further, retard the spark a notch at a time.

4. If the machine is seriously slowed, some of the extra air must be cut off.

5. On a level or almost level patch half-way up, re-advance the ignition a notch at a time, and if necessary assist the pick-up by pedalling sharply.

DRIVING OVER STONES.

184. With a tricar, make a rush and declutch on reaching the stones. With a motor bicycle, dismount if stones are seen in time. Otherwise hold tight, and do not reduce the pace. It is far easier to drive over new metal at twenty miles per hour than at six.

THE EXPENSE OF MOTOR CYCLING.

185. If all types of motor cycles are included, this becomes a very complicated question indeed; but as the question chiefly concerns those whose puzzle is whether they can afford to motor cycle at all, the annual expense of the cheapest efficient motor bicycle shall alone be considered.

FIXED EXPENSES.

Storage will cost nothing, since a motor bicycle may be kept in the hall, if the petrol system is tight. Unavoidable expenses will therefore be, for the first year:

	£	s.	d.
Licenses—Inland Revenue 15s., registration 5s., driving 5s.	1	5	0
Petrol 100 miles to the gallon for 5,000 miles at 1s. 4d. per gallon ...	3	6	8
Oil for 5,000 miles at 5s. per gallon	1	0	0
Carbide	0	5	0
	£5	16	8

SPARES AND ACCESSORIES.

Spare rubber belt 12s., spare valve 6s., spare platinum-pointed screw and spring 5s., spare belt fastener 1s., hooter 6s., lamp 15s., sparking plug 4s. 6d.; total £2 9s. 6d.

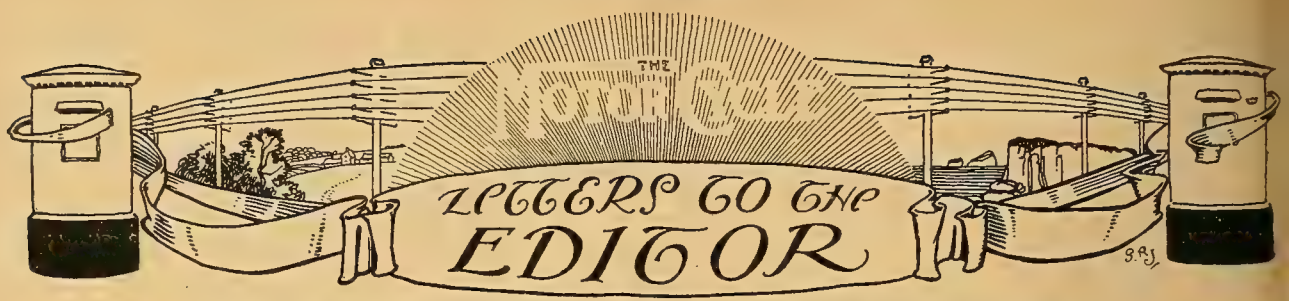
CLOTHING.

Many motor cyclists entirely dispense with special clothing, utilising an ordinary everyday waterproof reefer coat, Cardigan waistcoat, etc. So no charge under this head will be included.

REPAIRS AND REPLACEMENTS.

This is the head under which items vary so widely. If the rider is going to take every puncture, every adjustment, the grinding of his valves, etc., to a repairer, it is illimitable. But if he has a decent machine he may get through a season as the writer does, without necessarily entering a repair shop. The writer has had no training other than the school of solitary experience on the road, and as a consequence he spends nothing whatever on repairs. Replacements other than those indicated above should in the case of a new machine fall under the maker's guarantee. Tyres, which are not usually guaranteed, should last a year on a light single cylinder motor bicycle.

¶ *"THE AUTOCAR," which is published under the same proprietorship as "The Motor Cycle," is to the automobilist what this journal is to the motor cyclist. Any reader of "The Motor Cycle" who is also considering the purchase of a car should make a point of obtaining "The Autocar"—the leading motor journal. Price 3d. Issued weekly.*



The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Spring Forks and Side-slip.

[3191.]—I have read with interest the articles on side-slip, but have not seen anything dealing with skid of steering wheel. In this country our greatest hair raiser is sand, and it is always the front wheel.

On February 9th I had the mortification of seeing a rigid forked machine go through sand where I and others who have spring forks always dismount or come a cropper.

I wonder if any of your readers can recommend a remedy. Probably "Ixion" could give us some hints. The spring fork in question is the Truffault suspension.

For the benefit of your readers I might say I have ridden a Vindec two-speed gear for the last year, and found it completely reliable. T. W. IRLAM.

Transvaal.

Two-speed Gears and Hill-climbing.

[3192.]—In a recent issue Mr. E. D. Fawcett remarks that I might have put my two-speed Vindec to some severer tests during the tour I recently described in your columns. One reason why we did not tackle the Mont Caux climb was the fact that we did not wish to take more out of the rear tyre than was absolutely necessary. It will be admitted that the cover did well to last through the tour as it was, when the mileage and the double load are taken into consideration. Still, I have since regretted that the climb was not attempted, for I think we could have brought it off successfully with two up. Personally, I consider the two-speed gear indispensable. A month ago I took a sidecar with two ten-stone passengers and myself (the complete turnout weighing over 700 lbs.) for a fifty-mile spin over hilly (and muddy) roads. Of course the low gear had to be used very frequently, but the runs out and home were accomplished without a stop. I think this is quite as severe a test as driving solus up the stiffest of mountain passes, and if any motor cyclist who is still doubtful as to the advantages of a two-speed gear will attempt a similar performance with a single-geared machine, I fancy his conversion will be instant and complete.

H. HOWARTH.

Engine Design.

[3193.—I bought a copy of your excellent paper last week, and was very much interested in what your correspondent Mr. G. D. Monice said. While not agreeing with all he says about solid crankshafts and adjustable big ends, I do think that motor cycle engine bearings are hopelessly inadequate for the work they have to do, and so far from improving as time goes on, these bearings appear to be continually getting smaller. In other words, the life of the machine is being sacrificed in order to cut down the weight, and perhaps gain an extra half per cent. efficiency. I believe that this is a great mistake, and that it is the one thing above all others which prevents more people from buying motor cycles. How many business men, unless they are enthusiasts, will invest £50 in a motor cycle which will be worn out in two years? What is needed is a firm who will concentrate all their energy on building a motor cycle on engineering lines, which will run at least 15,000 miles without having to be sent to the makers for rebushing and the replacing of broken parts. It is of much more importance to the ordinary buyer to have a machine which is absolutely reliable for 15,000 miles than a machine which may save 6d. in petrol for the first 1,000 miles and be a constant source of worry and expense ever afterwards. WILLIAM T. WADE.

U.S.A.

Belt v. Chain.

[3194.]—I have read with interest the various discussions for and against the belt drive, and note that a correspondent last week considers chain drive essential for sidecar work. In the coming London to Edinburgh and return I intend entering a 6 h.p. Clifton Jap, belt drive, with Otto two-speed gear and rigid sidecar. I hope that our friend Montgomery will find time to compete as well, the two types being quite different; perhaps then we shall be able to prove by practical experience in long distance events the advantages and disadvantages of each.

P. W. VINSEN.

[We would suggest Land's End to John-o'-Groat's as a better trial, or a few hours' run, say Exeter to Dorchester, *viâ* Lyme Regis and Bridport.—ED.]

The Future of Motor Cycling.

[3195.]—I feel I must take exception to a remark o "Ixion's" in his reply to Mr. Hooydonk in your issue of th 11th inst., when he states that the 2¾ h.p. Excelsior was "th first motor bicycle of any real use produced in this country and streets ahead of any other machine."

In the latter part of 1902 I purchased a 3 h.p. Rex bicycle which during the following four years covered many thou sands of miles under ordinary touring conditions throughou most parts of the kingdom, and always proved itsel adequately powered so far as any single-geared machine o this h.p. could be. I am sure, too, from observation of Ex celsior machines I have come into contact with, that the Re was quite capable of holding its own.

As proof of the excellent materials and workmanship of m Rex engine, I may say that with the substitution of a wate cooled cylinder it has been for the past year in constant us on a heavy tricycle, which it is capable of propelling, unde favourable conditions, at nearly thirty miles an hour on th level. Except for the substitution of the water-cooled cylin der there have been no replacements in the engine in the wa of rebushings, etc., and the valve gear is practically as goo as new.

Now that two-speed gears are so much under discussion, may say that my Phœnix gear is in its fourth year of use and except for some inexpensive replacements, has require little attention. A most excellent feature about this gear i the clutch.

As regards the future of motor cycling, I think there is gap to be filled in the way of supplying a machine somethin on the lines on which my own has evolved, namely, three wheeler, well sprung, moderate power with water-cooling two speeds and belt drive with such as the Whittle belt which in my hands has proved absolutely satisfactory—an ample room for luggage, with efficient mudguarding.

In conclusion, I would add that anyone who substitute efficient water-cooling for air-cooling in the same engine soo can settle for himself the question as to whether an air-coole engine overheats. (Dr.) STEPHEN G. LONGWORTH.

[3196.]—With reference to your leaderette and the remark that I made in the discussion of Mr. Bell's paper on th future of motor cycling, I can only say that I have not th files of *The Motor Cycle* before me from which I can quo chapter and verse; but I have always been and am a clos reader of your valuable paper, and as such the opinion ha been forced upon me that you have without doubt, in m mind, preached the gospel of the heavyweight machines, an

his opinion has been confirmed to me in various directions y other readers. I do not deny that you have dealt with the natter of lightweight machines; but I do state, as my pinion, that after taking into account the matter of fair pro- ortion, the heavyweight has had all the limelight and the ightweight has been more or less left out in the cold. In aking my remark, I also had in mind the tricar, for it must e noted that the title of the paper was "The Future of lotor Cycling." I think you will agree that two of your eading correspondents are, or were up till recently, habitual iders of high-powered machines, and as such it is only atural that their writings should reflect their practice. With egard to the remarks by "Ixion," I do know that in May, 905, he described a 2 h.p. motor bicycle as only fit for the oo little novice, and even in your current issue his remark o the effect that if the trade ever turns out a lightweight hat is as fast and as comfortable as heavy twins, the latter ill die out but not before, can hardly be construed into an ncouragement of the lightweight type, because it seems to e that this question of a lightweight motor bicycle is only airly judged by what we have before us at the moment, and is, I think, handicapping the type out of the range of the resent-day possibilities to set it a standard, so far as pace is ncerned, equal to that of a powerful twin machine. De- elopments in detail of motor bicycles will move forward ogether. A better bearing or a more efficient pulley for a ghtweight will be adapted to a heavyweight, but there will lways be speed and difference in engine power. With regard o the point of comfort, I maintain that a lightweight achine is to-day more comfortable than a powerful twin. I so have a recollection of an illustration in a motor journal one of your regular contributors, wherein he was described one of the "heavy brigade," and if he has a book of cut- ngs I think he will be able to quickly light upon this illus- ation and also a statement from his own pen, wherein he finitely announces his championship of the powerful and erefore the heavyweight motor bicycle. I am sorry to have en the cause of this correspondence, but if, as a result, brings the lightweight motor bicycle into greater promin- ce, I shall feel that after all it has not been without good sult.

J. VAN HOOYDONK.

A Suggested Match on Brooklands Track.

[3197.]—In common, I suppose, with the majority of ur readers, I was greatly interested in the Triumph-Vindec atch recently contested at Brooklands, and very gratified at it called forth so much as it did of comment from the dly car papers.

Has it ever occurred to you that a very interesting match ght be organised for three motor cycles, single, twin, and ur-cylindered? I don't want to suggest anything very ex- nsive or elaborate. There is no call even for handicapping. Let us take three representative machines — strictly andard, of course—in genuine touring condition, let them rt level, and let us see which can keep Mr. Rodakowski's ing apparatus most busy for, say, an hour. The machines ould be normally geared, of course—I believe the F.N., ich is fairly representative of "fours," is ordinarily geared about 6 to 1—and in every respect just as they are sold to linary touring motor cyclists.

I don't think there is need for much ink to be spilt over e matter, as probably both the Vindec and Triumph people uld be glad to show what they could do against, say, the N. A match might easily be arranged, the loser to pay the ck fees, at little inconvenience and less expense. Should s come about, all motor cyclists would watch the outcome erestedly, and the winning machine would get an adver- ement of real value.

Trusting to hear the view of other readers on the matter,

E. N. DUFFIELD.

The Fascination of Motor Cycling.

[3198.]—I have a bone to pick with your wicked paper. me three years ago I was a happy and contented man, but ill-luck caused me to listen to the idiotic talk of a motor cling friend, and to read various numbers of his copy of e *Motor Cycle*. The result was a 2 h.p. —— (second-hand), ich gave me all sorts of trouble, and ought to have cured me e for all of this madness, but I still read this evil paper, d a 3½ h.p. —— was the result. Dirty hands, dried-up ution tubes, electric shocks, bad temper, came on as ore, but I still read on, and a —— sidecar added terribly my agonies. I became everybody's slave, and a "paying" chauffeur for every wretched visitor. Still, I read your collection of infamies, and invested in a two-speed gear. Then life became a burthen, and I was compelled, and, alas! am still compelled, to drive ladies about wherever they want to go, take them shopping, and escort male visitors to and from the station, sometimes with heavy bags, through all weathers. I take good care that nothing goes wrong, but now and again one must get a new belt, which stretches, as you know, and when going to or from the station I have to get off, and with muddy, frozen fingers shorten the belt and listen to the compassionate remarks of passengers about the bother of motors. Then, ah! then, it is difficult to refrain from saying and doing regrettable things.

Now you will say our victim is escaping; he will sell his accursed omnibus and be happy once more. Alas! no! He is waiting with impatience for the arrival of a 5 h.p. twin, which only the fortunate lack of funds will prevent being fitted with a magneto, two-speed gear, and handle-bar control.

Thank goodness, your power ends with motor cycles, and when some day—may it be distant yet—I am seated on a 9 h.p. twin, with sidecar, and furred and goggled passenger by my side, driving at awful speeds through mud and snow, with every appliance that diabolical ingenuity can suggest fitted, then you will be satisfied. And so shall I.

MOHUN A. TRENCHARD.

The End-to-end Run.

[3199.]—In reply to your footnote to my letter in *The Motor Cycle* of March 4th, I would like to say that most of the Burns relics are on view till ten o'clock, also that it could be arranged to have the Burns House and Mausoleum open for the convenience of any who might wish to visit them. Apart from these, the town is quaint and interesting, the hotel accommodation is ample, and there are good garage and repair shops. A band plays on the Dock Park in the evenings, and the park being alongside the river Nith, a quiet and pleasant time could be passed there by those who did not care to go sight seeing. In the meantime, I would be pleased to give the officials any further information they may desire. The club members here would be only too willing to assist in checking, and would do everything in their power to make their fellow motor cyclists comfortable when passing through Dumfries.

J. M. M. M'LEAN,
Hon. sec. Dumfries and District M.C.C.

Not a Luxury but a Necessity.

[3200.]—May I bring before the notice of my fellow motor cyclists a really good article, viz., the Mabon clutch? I had one fitted less than two months ago, and in that short time it has ceased to be a luxury and has become a necessity. I am delighted with it. My 6 h.p. bicycle, sidecar, myself, and a 10 st. passenger make a total weight of 5 cwts., and I use a gear of 4½ to 1, but the clutch will move this load from a standstill with perfect ease. The last week-end, on the London-Hastings road, I had to stop on several hills to help start a friend's bicycle which was in bad tune and would not climb, and in every instance restarted the above load from a standstill in the middle of the hill. One of these was Tubb's Hill, Sevenoaks. The clutch is metal to metal, and can be slipped to any extent without injury, thus making an admirable substitute for a two-speed gear. It is light, compact, and foolproof, and has been admired by all who have seen it in operation on my machine.

I may say I have no interest in the Mabon beyond that of a satisfied user. It has always been my practice to recommend a good thing when I have found it, and thus I hope you will see your way to publish this letter.

A. W. BROWNE.

Outside Flywheels.

[3201.]—I notice in last week's issue a letter signed M. Marshall, and it may interest others to hear my experience of outside flywheels from a rider's point of view. I may say that I am a commercial traveller, and use my mount for my business. I have had a good many machines through my hands (both inside and outside flywheels), my present mount being a 2½-3 h.p. Fairy. I have had this machine about eight months, and have covered some thousands of miles without experiencing the slightest trouble from the makers' method of fixing the flywheel. The only trouble I have experienced

is that it is difficult to adjust the timing or get at 2 to 1 gear without taking down the engine. In my new mount, of same make, at present on order, this trouble has been neatly overcome, as all gear is in a pocket outside crankcase, and another good point, both cylinders are fitted with forced lubrication. Trusting that my experience may be of interest to others and lead to further discussion on this interesting subject, a few letters as to cost of running lightweight machine would be of interest, C. S. NEWSON.

Two-speed Gears and Free Engine Clutches.

[3202.]—We note in your last issue the query put forward by your correspondent "Wim" with reference to the point as to driving on the exhaust with a machine fitted with our two-speed gear to such an extent that the engine ceases to drive the machine, and consequently the machine drives the engine. In reply, we beg to state that no damage can result to our gear when being driven in this way, provided that the driving is not carried to such an extreme that there is backlash between the dogs and the trips of our gear. The whole matter is one of judgment and fair handling. PHŒNIX MOTORS, LTD.

[3203.]—I should be pleased if you could find room in your esteemed paper for this answer to the severe critic of Mr. Wall (March 4th).

I beg to say that my statements as regards (1) easy manipulation of motor cycles in traffic with the air-cooled engines of the present time can still be upheld, as those engines of 4 h.p. or thereabouts are very liable to damage by running free for any space of time, unless they are governed automatically, and provided with an effective fan. I cannot see how Mr. Wall will manage in really heavy traffic, or, say, fog, simply by declutching.

(2) As regards handle starting, I am glad Mr. Wall admits the great difficulty in the direct handle start. The Roc is a departure from the majority in this respect, and geared up—virtually—this must of necessity be exempt from my first statement.

Special designers have special merits. May I take this opportunity to ask Mr. Wall how this clutch is to work with engines of, say, 1½-2½ h.p. only, which power, I think, is mostly in use on motor cycles. F.M.

[3204.]—Opinions from your readers who are using two-speed gears which Mr. Douglas Fawcett wishes to see expressed in your columns should be exceedingly interesting. The usual reliability and hill-climbing tests with which we are familiar do not, as a rule, present any special test of the efficiency of a two-speed gear. Until club contests include in their programme mean fast and slow hill tests, the public will have no favourable opportunity of judging the ordeal a two-speed gear is competent to face with impunity. In the absence of such special trials we quite understand a certain incredulity as to the remarkable capacity of a properly-designed motor cycle two-speed gear.

Mr. Fawcett says the Roc gear looks very well on paper, but if this gear proves as great a success as the clutch it will "mark a great advance." It can, of course, only be left to actual users to relate their experiences to show that the makers' claims of this gear are amply fulfilled.

The only trial in which the Roc gear has had an opportunity of being put to a public test was in September last at Sharpenhoe, when Roc single and twin two-speed machines were entered, and each carried off the gold medals for far the best performances.

As the sponsors for the clutch and gear system under notice, we cordially welcome any similar event, and might suggest, *e.g.*, the descent of the stiffest portion of any notorious hill, such as Porlock, River, Edgehill, or Birdlip, down to a half-way point, turning completely with the engine continuously running, and re-ascending from a standstill. The test might be made more searching still if the bicycle were coupled up to some passenger attachment.

Makers should welcome such a test to remove once for all any possible scepticism as to the capacity of a two-speed gear under the severest conditions that could be imposed.

We can quite understand Mr. Fawcett's conviction that for mountaineering tours a two-speed gear machine is indispensable. He sums up the situation very picturesquely by mentioning "that too much trick-riding is required if the machine is single geared." ARTHUR W. WALL.

[3205.]—Until quite recently I belonged to that numerou class of motor cyclists who, without wishing to go to the ex pense of having a two-speed gear fitted to their machines still desire to share the delights of our pastime with other by attaching a sidecar. I have always understood that to d this with only a 3½ h.p. single-geared machine at disposa was to court certain disappointment, unless, of course, on lives in a practically level district, and, after making a care ful study of the information, correspondence, etc., whic have appeared in *The Motor Cycle* relative to this subject, decided to investigate the claims put forward by advocate of the free engine clutch. In the result I had a Mabo clutch fitted, and, as it appears certain that a great man motor cyclists must be wavering on the sidecar question, trust you will be kind enough to allow me briefly to state m experiences.

With the sidecar attached and a nine-stone passenger seate in it, to which must be added my own weight of over te stones on the saddle, the machine, a 3½ h.p. Rex, has easil climbed all the hills between London and Dunstable, an those who know the road will agree that both Barnet an Ridge Hills—especially the northern side of the latter—ar fair tests for the combination. I got pulled up by traffic i the worst part of Barnet Hill on one occasion, but starte again by freeing the engine and letting in the clutch whe ready, getting going with both rider and passenger seated.

I also started from standstill in the centre of St. Alban with the full load, immediately afterwards making a sho right-angled turn and mounting the very sharp rise leadi to the Harpenden and Hatfield roads. It would, of cours be practically impossible to do this without the clutch, as one presumably, can push a machine with sidecar a passenger uphill and make a start, the machine being singl geared and 3½ h.p. No one with such a motor bicycle sound condition and the cash to spare for covering the tot cost of having the clutch fitted need hesitate about taki a sidecar. Need I conclude with the usual disclaimer pecuniary interest? H 3594.

[Barnet Hill and Ridge Hill are both moderately steep, b they cannot be compared with the hilly main roads Sussex, Surrey, and Kent.—ED.]

The Development of the Motor Cycle.

[3206.]—I have watched the development of the mo cycle from the first; my stable has held many patterns, a I am satisfied that there is no question so urgent as that variable gears. Mr. G. Freestone's letter [3152] is most p tinent, and I am sure it would interest thousands to kn where the gear described can be seen. (Letters addres c/o the Editor will be forwarded.)

Memory suggests that I gained more pure pleasure out the low power than the high, although for purposes of sp alone the high powers call for greater exercise of nerve a general ability, but it is not the lust of sport alone t impels me now to write. It is sober business necessity, a the practical question is how to get a machine that will ca one at speeds ranging down to four miles an hour thro traffic and over hills. Apparently, Mr. Freestone's mach answers these requirements, and it is noteworthy that Mr. Van Hooydonk (page 185) looks forward to the same idea

The important points are light weight, variable gear, saddle position, absence of pedals, and magneto ignition. machine with these advantages and of reasonable price wo command an immense sale. There must be thousands of p fessional and business men like myself who find the labou pedalling is too great to admit of the use of a pedal mach constantly, and the manipulation of a powerful motor bic too exacting for town use. One must be fit and ready work when making one's calls, and to the class of men i cated the machine described would be a boon. The Rex have been enthusiastic in meeting public needs; can they be induced to put such a machine on the market?

A PROSPECTIVE BUYEI

[Several interesting letters are unavoidably held over.—

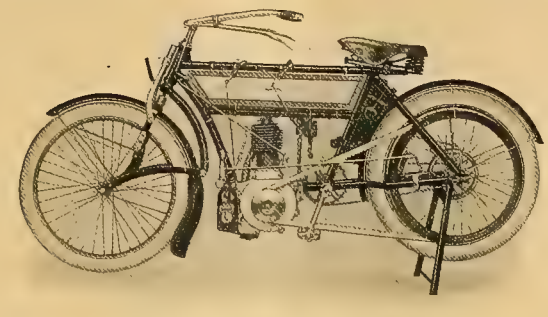
THE · MOTOR · CYCLE · OF · MERIT.

S.B.T. Co LTD



Model H. 3½ h.p. 80 × 98.

What a SATISFIED RIDER of a 1908 3½ h.p. "VINDEC" says:

"The quiet easy running of your 3½ h.p. was quite a revelation to me, after last season's experience with a machine of the same power with short stroke and high compression. As for speed, it will hold its own with any single-cylinder I know of, and will keep on going up steep hills that my previous machine would stop on half way up."

There will be other "VINDEC" riders who will have the same opinion of this model before the season is over.

DELIVERY BEFORE EASTER IF ORDERED AT ONCE.

Our profusely illustrated book of the 'Vindec Special' is interesting reading—sent free upon receipt of request.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—1d. per word, minimum 1s. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, on the Friday morning, or if sent to London, by the Thursday afternoon previous to the date of publication.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at *The Motor Cycle* Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed "No. 000, c/o *The Motor Cycle*, Coventry," or if "London" is added to the address, then to the number given, c/o *The Motor Cycle*, 20, Tudor St., E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with *The Motor Cycle*, both parties are advised of this receipt, and upon intimation of the arrival and acceptance of the goods, the money is forwarded less a charge of 1s. for registration. The time allowed for a decision after receipt of the goods is three days. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR BICYCLES FOR SALE.

HALIFAX Motor Exchange. — As the largest dealers in Rex machines, we have a few 1907 shop-soiled machines at clearance prices. Great bargains. Exchanges in all 1908 Rex and N.S.U. models.

HALIFAX.—Shop-soiled 1907 black and gold Rex de Luxe, twin tyre, magneto, Roc clutch; 1908 price £55 13s., our price £35; you save £20 13s. Only a Rex agent can do it.

HALIFAX.—1908 2¾ h.p. Peugeot, light, low, Bat frame, brand new; £21; cannot repeat.

HALIFAX. — 1907 35 guinea twin Rex, spring forks, soiled; £23; you save £13 15s.; we gain your confidence.

HALIFAX.—1907 magneto twin Rex, unridden, November price, £42, our price £28 10s.; another £13 10s. saved.

HALIFAX. — 1908 Rex de Luxe, Roc clutch, two-speed gear, magneto; 55 guineas; liberal exchange.

HALIFAX. — 1908 Rex featherweight, magneto, magnificent hill-climber, recommended; 25 guineas.

HALIFAX.—1908 3½ h.p. N.S.U., magneto, just delivered; £40; allow £25 for last year's model.

HALIFAX.—1908 5½ h.p. twin N.S.U., magneto; £52; allow £25 for 1907 single magneto, in good condition.

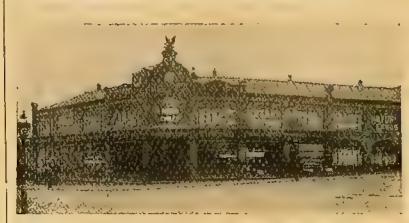
HALIFAX Motor Exchange. — Extended payments, exchanges; high-class machines purchased for spot cash. — 16, Westgate, Halifax. Telephone, 766. Telegrams, Perfection.

GOOD FRIDAY COMING,

and no new Motor Byke!

BAD, business, isn't it!

But it isn't too late yet, because The PREMIER MOTOR AGENCY has taken care to provide a good stock of the best MOTOR CYCLES, and so you can get Delivery from the Premier at once.



TRIUMPHS are already hard to get, but the Premier Contract with the Triumph Company enables them to deliver, if not from stock, at least in a few days. Do not leave it too late, however.

The REX Magneto Lightweight at **£25** is also a hot favourite. It is a charming little machine, low, light, and handy. Probably no better value has ever been offered.

The F.N. is another lightweight which has captured the public fancy. The geared engine pulley is a great idea, and F.N. workmanship is of course beyond reproach.

The MOTOSACOCHE (while we are talking of lightweights) is in a class by itself very far ahead of imitations. The engine is a magnificent piece of work, and the price is low.

The BAT is at the other end of the scale—not light, but the most powerful motor cycle made. The Premier Two-speed Gear and Roc (licensed) Clutch are particularly suitable to this machine.

The VINDEC, The ROC, The MINERVA, The BROWN, The N.S.U. are all well-established favourites. You cannot get any of the above more **cheaply or promptly** than from the **Premier Agency,** and they will **TAKE YOUR OLD MACHINE IN EXCHANGE,** making a **MOST LIBERAL ALLOWANCE.**

No space available for our list of

SHOP-SOILED & SECOND-HAND MACHINES this week. We will send complete list on receipt of postcard. They range from **£5** and upwards—no crocks.

Our other Specialities—

PREMIER TWO-SPEED GEAR with ROC (Licensed) CLUTCH.
PREMIER TUBULAR STANDS and LUGGAGE CARRIERS.
PREMIER SEARCHLIGHT LAMPS.
PREMIER ROAD CLEARERS.
PREMIER ACCUMULATORS.

SHAMROCK - GLORIA

The Bona-fide Belt for Motor Cycles.

Universally recognised as the most flexible Rubber and Canvas Belt with no stretch.

THE

1908

SHAMROCK - GLORIA

is incomparable with any other belt, made of the finest Rubber (not composition), which will prevent cracking.

For a good performance and long service you must have the 1908 Shamrock-Gloria, which, unlike others, has long passed the experimental stage.

Manufacturers of high - grade machines have adopted the Shamrock-Gloria as their Standard Belt—the wise Motor Cyclist will have no other.

Shamrock-Glorias command the largest sales all over the world, because they are the best and last longest.

Instructive Booklet on application.

THE FUTURE OF . . . MOTOR CYCLING.

was the subject of a Paper read by Mr. H. G. BELL before the Auto Cycling Union recently. He said, under the head of

WANT OF HANDINESS:

"Having disposed of the initial cost, depreciation, and maintenance questions, I now come to an equally important point, viz., the absence of 'handines,' and excessive weight. I give the trouble this term because I think it best explains the nature of this particular difficulty. I shall always remember a friend saying to me a few months ago, 'Why cannot manufacturers give us the facilities incorporated in a car? Why cannot the engines of motor bicycles be started by hand, and then the rider straddle the saddle, pull a lever or something similar, and glide off?'"

Now, that is just what the **PREMIER TWO-SPEED GEAR** with **ROC (LICENSED) INTERNAL EXPANDING CLUTCH** does. And the Gear is so well designed and strongly made that it takes the drive of the most powerful machines—9 h.p. Bat, for instance. Have a **PREMIER GEAR** with **INTERNAL EXPANDING CLUTCH** on your new machine. (We can supply without delay.) Or let us know what your present machine is, and we will quote you for conversion.

MY Footrests, reduced to 6s. 6d., are a luxury, spring rests, 17s. 6d.—Aldington, 59, Haydon's Park Road, Wimbledon.

WHIPCORD Breeches, latest cut; 10s. 6d. — J. C. Savage, 119, Donegall Street, Belfast.

2 h.p. Lightweight Engine, wants repairing; £3, or useful exchange.—Ben Short, Portslade.

FOR Sale, Eldorado V Belts, price, ⅜in., 9d.; ½in., 10½d.; ⅝in., 1s.; 1in., 1s. 2d.—Pollin, belt maker, Spalding.

CLARENDON Sets, including frame, engine rims, belt rim; £5 15s.—Wauchope's, 9, Shoe Lane, London.

ENGINES, air or water-cooled, 3, 6, or 9 h.p.; write for particulars.—Advance Motors, Ltd., Northampton.

WHIPCORD Cycling Breeches, latest cut; 10s. 6d.; write for patterns. —Booth, tailor, Longton, Staffs.

FARRAR'S Quadrant Loop Frames for vertical engines; 32s. 6d. each, including front forks and handle-bar.

FARRAR'S 1907 Quadrant Frames, 20½in. high, suit any engine; 50s., including front forks and handle-bar.

COW-VOICED Double twist horns, large size, terrific noise; usually 8s. 6d., my price 5s. 10d.—Farrar.

FARRAR'S Motor Handle-bars, 20in. long, 4s. 9d.; Lycett's patent Lightning stand, 4s. 9d. pair.

FARRAR'S Beautifully Enamelled Mudguards, 2s. 6d. pair; massive plated horns, terrific noise, 3s. 9d.

FARRAR'S Pocket Voltmeters, 4s., usually 12s. 6d.; sparking plugs, 10d.; magneto plugs, 1s. 6d.

FARRAR is open to buy, sell, or exchange anything in the motor line.

FARRAR wants sidecars in exchange for new £10 10s. gents' cycles, guaranteed 12 months.

FARRAR. — Send for my price list, pounds saved; sole agent Premier accumulators. — Farrar, Square Road, Halifax.

CHARGING Battery (Fullers four-cell), zinc lifter fitted; sacrifice 20s.—Johnson, 61, Hampton Road, Handsworth.

In answering any advertisement on this page it is desirable that you mention "The Motor Cycle."

MISCELLANEOUS.

BOOTH.—Brand new motor cycle, ready for tyres and engine, low built, suit 4 h.p. engine; £6 5s.

BOOTH.—Motor cycle (loop frame), with tyres, brakes, ready for engine; £5.

BOOTH.—New motor cycle, ready for twin engine and tyres, low built; £6 5s.

BOOTH.—Mudguards, with stays and screws, enamelled, 3in. 2s. 11d., 4in. 3s. 6d. pair.

BOOTH.—Silent silencers, suit engines to 5 h.p., no back pressure, very efficient; 3s. 3d.

BOOTH.—Fifty pairs Xl'all spring forks, latest 1908 pattern, fit any machine.

BOOTH.—Massive horns, deep tone, 3s. 9d.; double twist horns, terrible noise 4s. 9d.

BOOTH. — Voltmeters, watch pattern, usually 9s. 6d., 4s. 1d.; mica plugs, 1s. 1d.; De Dion pattern plugs, 1s. 1d.

BOOTH.—High tension wire, rubber insulation, 1s. 1d. yard; low tension, 5d. yard.

BOOTH.—Motor handle-bars, 20in. long, 4s. 9d. and 5s. 6d.; Price's patent stands, 5s. 11d., new.

BOOTH.—All sizes of genuine Stanley-Dermatine belting and fasteners; send for prices.

BOOTH. — Attachment for connecting motor cycle to tricycle, tyres like new; £4.

BOOTH.—Engines: New 6 h.p. twin Antoine, £8 5s.; 4 h.p. Antoine, £6 5s.

BOOTH.—Engines: New 5 h.p. water-cooled, for tricar, M.O.V.; £8 5s.; best maker.

BOOTH. — Engines: 4 h.p. Roc, fitted with magneto, nearly new, M.O.V.; £9 5s.

BOOTH.—Engines: 2 h.p. Universal, £1 15s.; 3½ h.p. Buchet, £3 15s.; 2¾ h.p. M.M.C., £3.

BOOTH.—Engines: 2¾ h.p. Minerva, £4 5s.; 2½ h.p. Buchet, £2 5s.; smaller engines taken part payment.

BOOTH.—Pair of new motor pedals, rubber, 4½in. wide, ball bearings; 4s. 6d.

BOOTH. — Hellior searchlight lamps, separate or fixed generators, detachable magnifying mirror lens, 12s. each, approval, sold elsewhere 25s.

BOOTH.—Gas lamps, separate generators, powerful light, 5s. 3d.; nearly new twin Invicta trembler coil, 16s. 6d.

BOOTH. — Large leather toolbags pockets for everything, best quality, not cardboard; 5s. 6d.

BOOTH.—Six accumulators, four volts, celluloid cases, require repair; 10s. the lot.

BOOTH.—Please note our address, Coronet Works, Wade Street, Halifax. Telephone, 198Y.

CHEAP Motor Cycle Houses; catalogue sent free.—Portable Building Company, Felsham Road, Putney, London.

3½ h.p. Water-cooled Fafnir Cylinder, nearly new, with nickelled unions; £2.—Werry, 200, Old Street, London, E.C.

YOUR New Mount is incomplete without the Advance adjustable pulley; £1.—Advance Motor Mfg. Co., Ltd., Northampton.

EVERYTHING Made in cycle tanks except a fortune. Write for prices. —A. Phillips, 2, Strathnairn Street, Bermondsey.

MAYFAIR Accumulators, guaranteed; 15 a.h., 10s. 6d.; 20 a.h., 17s. 6d.; 40 a.h., 30s. — Fellows, Hertford Street, Mayfair.

OSBORNE Four-speed and Free Engine Pulley, new 1907 pattern, unused; £4. — Cooke, Oxford Street, Barrow-in-Furness.

Stanley Dermatine Motor Belt.

The Belt that carried everything before it in 1907 Season, and opens the 1908 Season by winning

THE FIRST TRIAL OF THE SEASON.

Miss Muriel Hind, in the Auto Cycle Trial on Saturday, Jan. 25th, made fastest time on the Hill Test, using **STANLEY DERMATINE BELT.**

The Dermatine Belt is the original British rubber and canvas belt, with transverse grooves, and is far ahead of any other make belt. **Every Belt stamped "STANLEY DERMATINE."**

BEWARE OF IMITATIONS.

The standard belt that is adopted by all leading manufacturers.

HUNDREDS OF TESTIMONIALS.

NOTE THE PRICES.

⅝in.	¾in.	7in.	1in.	
1/2	1/4	1/8	1/11	per ft.

POST FREE.

THE STANLEY DETACHABLE MOTOR BELT FASTENER.

With unbreakable Terry's hook. Guaranteed. (Made under Simplex Patent.) In sizes, ⅝in., ¾in., 7in., 1in., 1/- each. Wholesale and Retail.

THE STANLEY DERMATINE MOTOR BELT CO., 32, LONDON ROAD, BROMLEY, KENT.
Stanley Webb, Manager.

LOSS of POWER

There's nothing your motor would prefer to see more than a precipice to climb after reboring and fitting new piston by Gradior Machine Co., Compression Specialists, Stafford. Fit of piston is guaranteed to 4/1000 ins., and bears 13 stones on the pedal.

WRITE FOR LIST.

THE GRIP MOTOR CYCLE HANDLE.

Black Buffalo Horn Handle, 2/6 per pair post free, with solution for fixing. Give size of handle-bar. Trade terms on application. **HILL BROS.,** 32, Broom Close, Sheffield.

MISCELLANEOUS.

SEVERAL Double-cylinder Coils, H.S. trembler, best English; to clear accept 22s. each.—Aylaston Motor Works, Derby.

BELTING.—⅝in., 7½d. foot; ¾in., 8½d. foot; ⅞in., 9½d. foot; 1in., 10½d. foot, by Pollin, of Spalding. — Wauchope's, 9, Shoe Lane, London.

INCLINED Frame, for 26 wheels, also 1¾ Mayes; exchange for pair 28 by 2in. beaded covers.—Partington, 199, Preston Road, Standish.

LONGUEMARE Carburetter, suit 6-12 h.p. engine, 10s.; coach-built forecar seat, 12s. — Stevens, 4, Goldhawk Mews, Shepherd's Bush.

MABON Clutch, complete, only run 20 miles, suitable for Triumph, with sidecar; 45s., or nearest offer.—B. Cumberland, The Lynchet, Luton.

500 Pairs Military Gauntlet Gloves, all leather, at 2s. 6d. a pair; also military riding breeches at 4s. 6d.—Anscomb, 14, London Road, London, S.E.

BASSEE-MICHEL Trembler Coil, good as new, 10s.; Longuemare carburetter, suit 2¾ h.p. engine, 10s.—Fairhead, builder, Melville Road, Walthamstow.

CARBIDE, guaranteed, 4, 7, 14 lb. tins, 3½d. per lb.; should be ordered in 21 lb. lots to save carriage.—Stansell and Son, Acetylene Gas Engineers, Taunton.

ENGINES.—2 h.p. Clarendon, new, £3; 2¾ h.p. M.M.C., variable pulley, £4; 3 h.p. Fafnir, £4 10s.; 6 h.p. water-cooled Aster, £10 10s.—Wauchope's, 9, Shoe Lane, London, E.C.

HALIFAX.—"Perfection" belting, new principle, ⅝in., 10d.; ¾in., 1s.; ⅞in., 1s. 2d.; 1in., 1s. 4d. per foot; 3s. allowed for your old belt to popularise.—16, Westgate, Halifax.

FRONT Wheel, new, 26 by 2, 8s.; Dermatine, ⅞in., 6s. 6d.; another, ⅞in., 6s. 6d.; twin Rex pulley, new, 5s.; 1905 Rex pulley, piston rings, 7s. — Tuley, Northfleet, Kent.

WAUCHOPE'S arrange Exchanges of all descriptions. Liberal allowance for second-hand machines in part payment for new models. — Wauchope's, 9, Shoe Lane, London.

ALVASTON Works, Derby. — 7 h.p. marine motor, fitted with paraffin carburetter, brand new, inclusive of starting handle and silencer, guaranteed perfect order; accept £9 10s.

ALVASTON Works, Derby.—Brand new Harvey-Frost workshop type vulcaniser, with extra steam mandrel, perfect, guaranteed; cost nearly £10, accept £5 10s., immediate cash.

ONE Pair 35s. Side Lamps, 20s.; one 35s. motor bike headlight, 25s.; one 25s. ditto, 18s.; one generator, 4s.; all new; double-cylinder plain coil, 9s.—8 Crieff Road, Wandsworth.

READERS Having Photographic Apparatus for sale should advertise in "Photography" Emporium, ½d. per word, minimum 6d. — Address, "Photography" Offices, Coventry.

DE DION Parts.—2¾ h.p. cylinder head complete, flywheels, timing wheels cover, contact breaker, ⅞in. pulley, 30s. motor cycle frame, suit twin, 35s.—1, Brunswick Street, Walthamstow.

ENGINES.—5 h.p. twin Kerry, £7 15s. 2½ h.p. De Dion, £2 17s. 6d.; 2¾ h.p. M.M.C., £4; ditto pattern, £2 10s.; 2 h.p. Jap, £5; 6 h.p. w.c. Aster, perfect £10 10s.—128, High Road, Tottenham.

ITALIAN Headlight, by Zanardini, Milan, 20s.; leather jacket, 15s.; dust coat, 5s.; 1905 Rex valve, 2s. 6d.; quantity of various spares; stamp, reply.—Penny, 119, Belvedere Road, Burton-on-Trent.

MOTOR and Cycle Agents should read "The Cycle and Motor Trades' Review." Specimen copy post free on receipt of trade card. — "The Cycle and Motor Trades' Review" Offices, Coventry.

FOR Sale, motor boat, 5 h.p. Mors, twin cylinder engine, guaranteed good order, and reliable, painted white, up-to-date, and fast; £32; consider exchange. —Whitehouse, 32, Reform Street, Dundee.

The Motor Cyclists' Ideal.

DOUBTLESS many readers who filled up the postal form circulated with *The Motor Cycle* of March 18th will be anxiously awaiting our announcement of the result. We must, however, ask them to be tient yet awhile. The query form is not an linary one with simple questions. If it were, it uld be quite possible to hand over the whole of the olies, which, by the way, are extremely numerous, a clerical staff to sort and tabulate, and the result uld be known in a few days. Unfortunately, no linary clerical staff could deal with these forms. ey require practical knowledge of the motor cycle, d can, therefore, only be dealt with by our own itorial staff, who naturally can only devote a certain nount of time daily to the compilation of this table— able, we may say, which will be of more than ordinary erest when it is published. We can only say at the oment that it may be several weeks before the tabu- ed list of replies can be published, but we hope next ek to refer to some of the more interesting replies.

The A.C.U. Council Meeting.

THE A.C.U. council meeting has come and gone, and all will admit that it was a most successful meeting, and one which should be of considerable assistance in securing the affiliation of all provincial clubs. Personally, we regret that Mr. H. Hall, the president of the Sheffield and Hallamire M.C.C.—a club with over 100 members—was t elected on the committee. Mr. Hall has done a st amount of good work for motor cyclists, and, hough perhaps inclined to be over impulsive, we have proof of his good work, and we feel sure that if a place had been found for him on the committee his aid would have proved very valuable.

We were very pleased to notice that the majority of the suggestions which have been made in *The Motor Cycle* editorial columns have been adopted, notably a perambulating council, the affiliation of Scottish riders, a centre scheme on the lines of the N.C.U. centres, etc. Practically the only suggestion we have made which was vetoed by the committee was the proposition for a scheme for unattached riders. We can only conjecture that the lack of "ayes" for such an important proposition was caused by the presence of a large number of delegates from provincial clubs, who perhaps thought that any scheme for unattached riders would affect their local membership. Correspondence in *The Motor Cycle* proves that there are riders who do not wish to join a club, but who would be willing to pay a moderate subscription to a body like the A.C.U. if allowed to participate in certain advantages.

Mr. Robert Todd's remarks with regard to taxation were not particularly encouraging; nevertheless, we hope Mr. Asquith will give motor cyclists his best consideration. We are already taxed considerably more, in proportion, than any other class of motorist, and it would be distinctly unfair to raise the present rates. We still have the copy of letter on taxation which the Sheffield and Hallamshire M.C.C. sent to Parliamentary representatives in Sheffield and district. Several clubs have applied for a copy of it and sent it to their representatives.

The centre scheme should work well. A system of decentralisation is part of the R.A.C. scheme; it should therefore receive every support at the hands of the A.C.U. Once the provincial clubs are working enthusiastically with the head body success is assured.

CHAIN v. BELT.

By B. H. DAVIES.

THIS ancient controversy bids fair to be entirely re-opened by the call for a motor bicycle suitable for use with a sidecar. We had all regarded it as long since dead and buried, and to see such widely divergent opinions furiously restated must be very puzzling to the young motor cyclist, intent upon the specification of his first or second machine. With the Editor's permission I therefore propose to sum up the conclusions of past history on the matter.

Whatever may be the preferences of a scanty handful of individuals, one has only to peruse "*The Motor Cycle* Buyers' Guide" to see that for motor bicycle purposes, apart from the haulage of a passenger, the belt has altogether ousted the chain, and I may add that this is by the united verdict of both manufacturers and users. Here and there one discovers an isolated individual who is enthusiastically loyal to the chain drive; but the majority of riders will have nothing whatever to do with it at any price, and most makers dare not trust their machines to that large percentage of duffers who figure on their order books with any other drive than the belt.

Spare Belts need not be Carried.

Time was when you could search the market without finding a single machine possessing a satisfactory belt drive; I can remember the days when I regularly took two complete spare belts on a long tour, whereas to-day I take no spare belt, not even a few inches of belting, and perhaps not so much as a spare fastener; yet even in those days the chain drive was fighting for its existence. To-day, when the belt drive is perfected, the chain is practically dead, and we are not surprised to find it so. It survives on a few machines, and those makers who have stuck to it through the last five or six years turn out thoroughly satisfactory examples of it. But as a rule it will be seen that such makers have been compelled to stick to it, through some feature of their machine (such as a two-speed gear) forbidding belt transmission altogether; and it is a fair inference that, if they could have adopted the belt drive without sacrificing the notable feature of their own particular machine, they would probably have done so.

The Chain Drive for Passenger Work.

The natural conclusion, therefore, is that, given two equally skilled and careful riders, plus two machines of equal merit in design and workmanship, one belt-driven and one chain-driven, both men will have an equally pleasant season; but that for indiscriminate sale or use the belt is infinitely safer. We may therefore put the chain drive out of court, except for special purposes, such as a two-speed gear or passenger work.

I am almost equally emphatic in putting the belt out of court for work with passenger attachments, and especially for two-speeded passenger work. A *huge* belt will stand the double strain of extra load, of a low gear, of the sudden jerking of the load back on to the engine after a gear change on a hill, but it will not stand it so well as a chain will stand it, and then pulleys and belts large enough for the purpose are not made. A double belt might stand it, but the two or three firms who tried this plan have abandoned it. The Whittle belt stands it better than any other bel I have tried, but I do not consider it equal to the chain

The chain has two huge advantages for passenge work:

(1.) It cannot possibly slip.

(2.) If attended to at the start of a run it nee never be touched till the run is over, whereas a bel very, very seldom gets through one hundred mile with a passenger without stretching

Further than this, we find a grave defect whic impairs the safety of a chain as used on a moto bicycle solo, and which does not exist when a passeng attachment is added. On a solo motor bicycle, if th engine jams, or if the chain comes off, the rear whe is generally locked, and the rider sustains a nasty fal When a passenger attachment, either fore or sidecar, added, the combination will give a big swerve if the re wheel is locked in either of these ways, but there wi be no overturning, and no real danger of person damage.

Weight and Chain Transmission.

A second defect of the chain in solo work is al removed when the chain is applied to passenger wor Lightness is a prime consideration for solo worl weight is saved wherever possible in frame, engine, a transmission. Additional weight is necessary in these parts when a chain is employed, but extra weig matters very little in a passenger combination, whi is started by a handle and a clutch, and possesses emergency gear.

For passenger work, therefore, the chain adds t great advantages, reliability and efficiency, each which can easily be procured by the belt in solo wor but cannot be procured so easily in passenger work.

Similarly, when applied to passenger work, the cha loses two of its main drawbacks in solo work, name danger and weight.

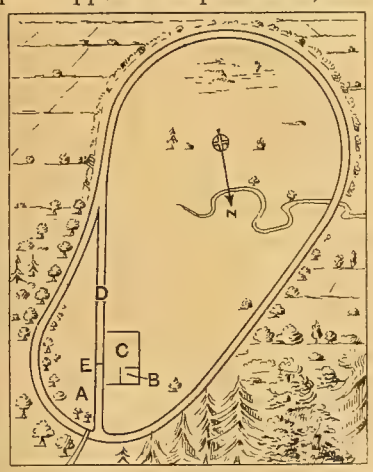
Its other main drawback, that of requiring freque and messy attention, belongs in a greater degree to t belt when applied to passenger work, just as in so work it applied more particularly to the chain.

And so we may venture to say that a fair conclusi is, the chain for passenger work, wherever possible, a the belt for solo work, wherever possible. And if t same bicycle be used for both passenger and solo wo my vote would undoubtedly go to the chain.

We have received a sample of the latest Ingers watch for attaching to the handle-bar of motor cycl which has a very novel feature. In the centre of t dial there are six concentric circles. Within the inn most circle are printed the months of the year, and the five outer ones will be found the times for lighti lamps on the 1st, 8th, 15th, 22nd, and 29th of ea month. Everyone will agree that the combination of timepiece and lamp lighting table on one dial is a m useful novelty. The handle-bar clip is neat and stron and the watch cannot be jolted out. The price of t watch and clip is most moderate, and one of them said to have been used on a motor cycle for 12,0 miles without injury. Price and further particula can be obtained from R. H. Ingersoll and Bro Audery House, Ely Place, Holborn Circus, Londo E.C.

Motor Cycles on Brooklands Track.

OF late a good deal more has been heard of Brooklands in connection with motor cycles, and such a state of affairs is distinctly refreshing, especially when it has to be recorded that Mr. E. De Rodakowski, the secretary of the Brooklands Club, is one of the latest converts to motor cycling. And this is how it came about. One day last week two or three enthusiastic members of the Auto Cycle Union, elated at the prospect of a race for motor cycles on Brooklands, which is to be held probably on Easter Saturday, decided to take two or three machines down to the track and find out a few facts concerning it. Previously the only data on which they had to go were the reports of two gallant naval officers, who drove round till their machines became almost red hot, and the private match between Messrs. Bickford and McMinnies, which has been described recently in these pages. First of all it is necessary to glance at a bird's eye view of the course, to which we refer our readers. The usual procedure for cars is to start on the stretch D at a point opposite the pavilion B, and then continue round the outer circle, when after the agreed number of laps have been covered they finish along the straight stretch D. The grand stand A is on a hill behind which the course passes, and while the competitors are on this section they are necessarily out of sight. It was with a view to obviate this that Messrs. Straight, Reynolds, Wells, H. Collier, sen., and H. A. Collier went down to the famous motordrome last week. It was thought (and rightly so, too) that if the motor cycles could be kept within the inner circle the public would be better able to appreciate their performances. To test the practicability of the idea, Wells and Reynolds, on twin-cylinder Vindecs, started at the top of the straight, and careered at full tilt down it. Wells travelled at a goodly speed, took the corner leading to the main track, went high up the banking, and almost landed in a patch of newly laid cement some distance farther on (the track is now under repair), while Reynolds was more cautious, since he slowed at the corner. Both then returned, and announced that at the speed at which they had been going the corner was impossible, as there was no banking at the very spot at which it was most wanted. This does not mean that the track is badly designed, as it was being used then in a manner the reverse to which it was intended. The two riders were not, however, to be daunted, and each separately had another try, but with no better success. Collier, unfortunately, could not make the attempt, as his Matchless racer was not in such good form as it might have been.



A. Grand stand.
B. Pavilion.
C. Competitors' enclosure.
D. Finishing and starting straight.
E. Finishing line.

Mr. Roadkowski Delighted with Motor Cycles.

In the interval Mr. Rodakowski was persuaded to try Reynolds's light roadster Vindec. It was his first ride on a motor bicycle, and in this case we have an absolute novice initiated into the pastime on a fast 5 h.p. twin! On his return he expressed himself delighted with the machine, and stated how much surprised he was at the total absence of engine vibration and the easy manner in which the machine was controlled. Various tests followed, which resulted in the decision that the machines should be started at a point almost opposite the pavilion, as it had been found that they then had not time to get up enough speed to be travelling at a dangerous pace when the corner was reached. Through the courtesy of Mr. A. G. Reynolds we were able to try the track for ourselves, or at least that portion of it which was available. Riding on it was a delightful experience; there was a sense of unfettered freedom, which can be felt nowhere else, even on a straight deserted road in the Fen country. The Vindec pulled magnificently, but was under-geared for the work, and so never slowed at all up the 1 in 30 gradient behind the hill. Along this section there is no need to take the banking even at a speed of nearly forty-eight miles an hour, and both here and along the straight the surface is practically perfect. While witnessing car races the worst bumps seem to occur high up the banking beyond the foot bridge, but at a point not reached until over sixty miles an hour is obtained. On the portion of the track available at any rate the surface is excellent, and if any car driver can complain of this section it simply means that on a sprung vehicle he is unprepared for violent road shocks, while the motor cycle rider expects them, and knows what to do when they occur. Collier rides on a piece of cardboard attached to the carrier, but keeps almost the whole weight of his body on the footrests, thus avoiding the effect of all inequalities of the surface, and at the same time having his machine under perfect control. The Easter meeting will be looked to with interest by motor cyclists. Motor bicycles have never before competed on what is, humanly speaking, a perfectly safe track, so that what the result of the races will be may only be conjectured.

The London agents for Riley tricars, the Service Co., 292, High Holborn, W.C., are making adequate arrangements to give trials of these machines at short notice from the above address.

We gave two illustrations and a description of work accomplished in the repair of cracked water jackets by Lea and Son, Runcorn, in our issue of April 3rd, 1907. At that date the repaired cylinders showed a slightly raised appearance where the fracture had been, but Lea and Son inform us that further improvements have since been introduced, so that the work is now absolutely smooth with the remainder of the casting, and it is practically impossible to locate the repair. It should, however, be borne in mind that repairs can not be made to cylinders broken on the line of the piston's travel.

OCCASIONAL COMMENTS

By "IXION."

Lightweights and the End-to-end.

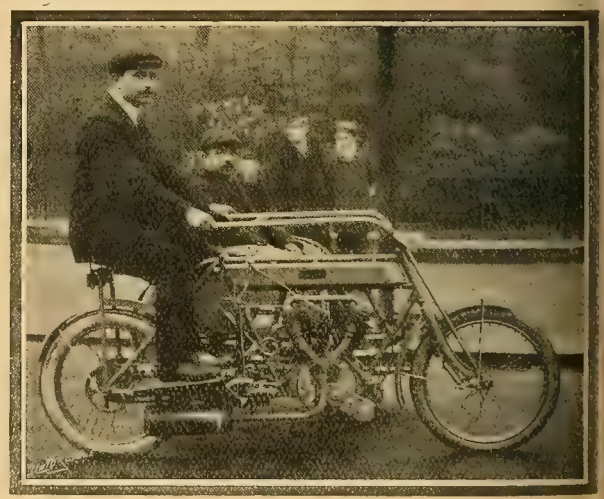
It is a little unfortunate that during the first year of the lightweight boom the A.C.U. trial should be from End-to-end. One of the defects of a very low powered lightweight is its incapacity to make fast running against a strong head wind, and there are several sections of the Scotch route, notably from Ballinluig to Cockburn Cottage at the summit of the Grampians, where the gradient and surface will be heavily against the competing machines, and in all probability a sturdy head wind will be encountered. Lightweight machines cannot hope to maintain the official minimum of 15 m.p.h. should the conditions be unfavourable over these heavy sections. A suggestion has been made to me by a lightweight enthusiast, who desires to ride his 80 lb. machine in the great trial of the year, that the more northerly days' riding should be arranged as follows: All lightweight machines to be started first, and the start to be as early as possible; if strong head winds are encountered, the lightweights to be set a minimum of 12 m.p.h. through all or any of that day's controls, at the discretion of the judges. He unkindly adds that, if, as per previous End-to-end, the official car is in the rear, it would be easy for the judges to wire ahead to one of the section officials. It would be interesting to have the opinion of other lightweight enthusiasts as to whether this type of machine needs consideration of this sort in the trial or not. I am aware the Motosacoche held its own last year, but on English roads in the more southerly counties and on a circular tour, the wind is not so serious a factor. The End-to-end trial has now been fixed for July 13th-18th.

Worn Chains.

A very valuable wrinkle appeared in a letter from Dr. Gaskell, page 206, March 11th. He described how nothing would induce the chain of his small tricar to remain on the sprockets unless it was run so tight that considerable friction was set up. He finally solved the difficulty by purchasing a new chain; this would keep on the teeth at quite a moderate tension, and the failure of the old one was thus indicated as being due to loss of pitch. The links were riding on the top of the teeth, and so an infinitesimal amount of sag or sway was sufficient to throw it off. Some of the early tricars were fitted with chains far too light for their work, and as the chains were totally unprotected and the machine used in all sorts of weather, new chains very soon become necessary. The sprockets of these tricars are usually peculiar, owing to the eccentricities of the gearbox design, and so riders, having discovered their chains are too weak, abandon the idea of fitting stronger ones, because they cannot obtain heavier sprockets. Not every rider knows that two or three different sizes of chain can be interchanged on the same sprockets. Consequently any driver of one of these machines suffering from chain troubles would do well to send one of his sprockets to the chain makers, and ask them to forward him the strongest chain which can be run on it. A friend of mine recently transformed a very tiresome little tricar into quite a serviceable vehicle by fitting a heavy chain on the light sprockets provided. That is six months ago, and he has had no trouble since. It is not mechanical, but it works.

Strange Experiences with Gudgeon Pin Screws.

Anyone who has a long experience of the whimisicalities of a motor bicycle is well aware it is impossible to prophesy what it will do next; but every now and then there arises a rider equipped with that little knowledge which is such a dangerous thing. A correspondent has just written denouncing my paragraph on page 216 describing how a gudgeon pin set screw fell out of the piston, and was ejected through the cylinder walls at the bottom of the piston's stroke. He describes this paragraph as an attempt to bamboozle my readers, and consequently I publish in self-defence the names of two riders who have undergone this experience. When I wrote that paragraph I had only one name before me—Mr. V. G. Whitelaw, the Midland Counties hockey player. The day after the paragraph appeared Mr. Le Pine Jackson wrote to tell me the same thing had happened to him with another make of engine. My incredulous correspondent will probably now have the courtesy to withdraw his very impertinent remarks. His incredulity is evidently based on an inexcusable blunder of his own, for I think he imagines the gudgeon pin screw was described as emerging above the piston. Nothing in my paragraph suggested that. The pistons in both cases were clearly short ones, and at the top of their strokes when the screw was driven through the cylinder walls at points near the bottom of the strokes.

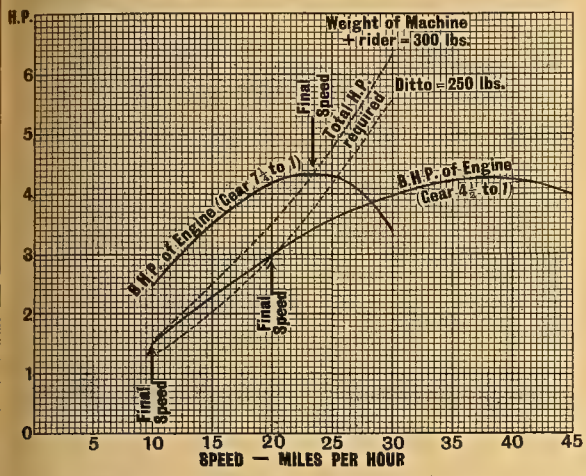


A powerful passenger machine, referred to by Chater Lea, Ltd., in letter No. 3157, issue of March 4th. The engine is a 9 h.p. Jap with magneto ignition. The drive is by chain through a 9in. clutch and a two speed gear box. The engine is placed higher than usual on account of the bad roads in South Africa, where the machine will be used. The sidecar is built of standard Chater Lea fittings using slightly heavier gauge tubing. Other details will be observed by a close inspection of the illustration.

The Selection of Gear Ratio.

By A. G. LEE, B.Sc. *(Concluded from page 232.)*

Fig. 3 shows the total horse-power required on gradient of 1 in 7¼ for two machines with W =



H.P.
Weight of Machine + rider = 300 lbs.
Ditto = 250 lbs.
Final Speed
Total H.P. required
B.H.P. of Engine (Gear 7¼ to 1)
B.H.P. of Engine (Gear 4½ to 1)
Final Speed
Final Speed
SPEED — MILES PER HOUR

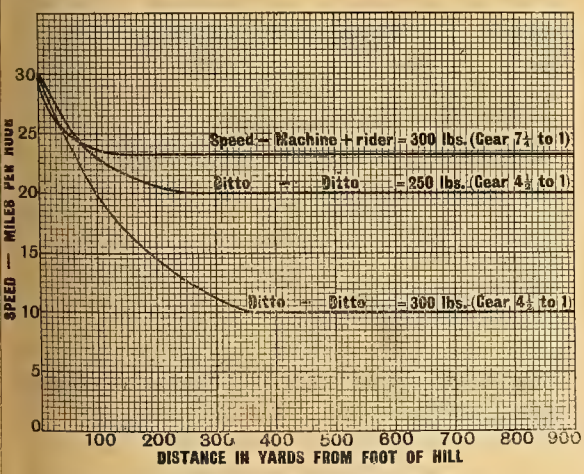
Fig. 3. Horse-power required on gradient 1 in 7¼ for machines of different total weights.

00 lbs. and 250 lbs. respectively. The same engine taken for both machines, and the brake horse-power shown with a gear of 4½ to 1, and also with a ear of 7¼ to 1.

The influence of the weight of the rider is shown by ie greater horse-power required when W = 300 lbs. he final speeds are respectively ten and twenty miles er hour when both machines have a 4½ to 1 gear, ut if the 300 lbs. machine be given a gear of 7¼ o 1 it will attain a final speed of twenty-three miles er hour.

'he Point at which the Change of Gear should take place.

It will be noticed that the brake horse-power with ie two gear ratios is equal when the speed is at venty-eight miles per hour. Below this speed there



SPEED — MILES PER HOUR
Speed — Machine + rider = 300 lbs. (Gear 7¼ to 1)
Ditto — Ditto = 250 lbs. (Gear 4½ to 1)
Ditto — Ditto = 300 lbs. (Gear 4½ to 1)
DISTANCE IN YARDS FROM FOOT OF HILL

Fig. 4. Speed at various distances up gradient of 1 in 7¼.

s more power on the second gear. This, therefore, s the point where the gear should be changed.

Fig. 4 gives the speeds at various points on a hill with gradient 1 in 7¼. Here the three machines start with an initial speed of thirty miles per hour at the bottom of the hill.

The kinetic energy of the machine plus rider is

$$\frac{W}{g}$$

therefore ½— (30 × 1.467)² foot lbs. where g = 32.2.

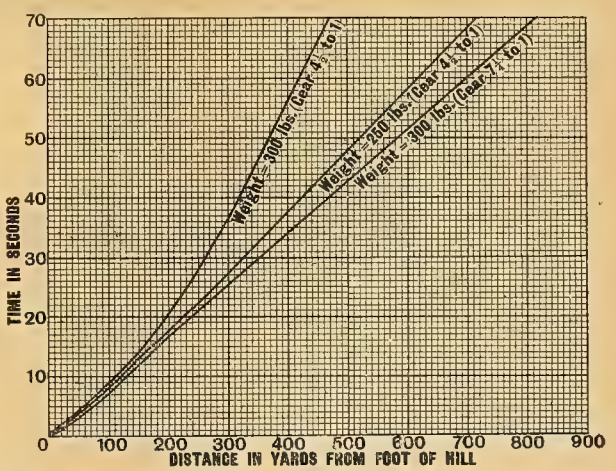
This is equal to 9,000 foot lbs. in the case of the 300 lbs. machine.

As the speed drops the kinetic energy is given up, and provides the balance of horse-power required at any given instant.

One example of the calculation of the rate of drop in speed will suffice to demonstrate the method. Referring to the curve (fig. 3), it is found that between thirty and twenty-eight miles per hour the mean horse-power required for the 300 lbs. machine in excess of that available is 2.05. This has to be made up by the kinetic energy given up by the machine.

2.05 h.p. = 2.05 × 550 = 1,125 foot lbs. per second.

Between thirty and twenty-eight miles per hour there is a loss of kinetic energy of 1,160 foot lbs. This will, therefore, suffice to provide 2.05 h.p. for $\frac{1,160}{1,125}$ = 1.03 seconds.



TIME IN SECONDS
Weight = 300 lbs. (Gear 4½ to 1)
Weight = 250 lbs. (Gear 4½ to 1)
Weight = 300 lbs. (Gear 7¼ to 1)
DISTANCE IN YARDS FROM FOOT OF HILL

Fig. 5. Time in seconds taken to reach various distances up hill of 1 in 7¼.

The distance travelled in this time at the mean speed of the interval—twenty-nine miles per hour—is 14.6 yards, so that in 14.6 yards the speed has fallen from thirty to twenty-eight miles per hour.

Similar calculations have determined the remainder of the curves.

It will be noticed that the speed with the 7¼ gear drops more rapidly at first than that of the other machines, but attains a higher final speed.

Fig. 5 gives the time in seconds of the same three machines at various points up the same hill.

The initial impetus is equivalent to a start of 120 yards in the case of the 300 lbs. machine (gear 4½ to 1). as it allows it to develop a larger horse-power than

The Selection of Gear Ratio.—

its normal for about 360 yards up the hill, when it settles down to its steady ten miles per hour.

The initial impetus with the 300 lbs. machine (gear 7¼ to 1) is only equivalent to a start of twenty yards.

It will thus be seen that the effect of an initial rush is much more important where the final speed of the machine on the hill is low and the length of the hill is short.

Empirical Formulæ for Choice of Gear Ratio.

We have seen above that to get the best results the gear should be altered for each particular gradient.

In practice, however, we are usually limited to a choice of two gears. These should be such that the highest gear is properly proportioned for running on the level and the low gear for a gradient of 1 in 10.

The high gear will then in most cases take all hills to 1 in 15 fairly comfortably, while the low gear may be trusted to look after the remainder.

For an ordinary tourist machine the follow formulæ may be taken as being simple and fairly tru worthy, provided the limits of their use are not stretc too widely.

For running on the level the best gear ratio is

$$\left(3 + \frac{6}{\text{b.h.p.}}\right) \text{ to } 1.$$

For running up hill (1 in 10) the best gear ratio

$$\left(3 + \frac{0.05\ W}{\text{b.h.p.}}\right) \text{ to } 1.$$

The Agricultural Hall Show.

A SECOND VISIT.

A SECOND inspection of the exhibits at Cordingley's Show revealed a few more items which will interest our readers. The two lightweight Werner motor bicycles shown by H. J. Harding, and referred to in our last issue, were to be seen in the early part of last week, and a few words about them will not be out of place. In appearance they possess the usual Werner features. The frame is built low, and the engine, which is of 1¼ h.p. (60 by 70), is placed in the usual Werner position. The carburetter is also on the familiar lines followed by this well-known firm, while the ignition is by a Dinin accumulator and plain coil, carried in a compartment in the tank. This machine is claimed to run one hundred miles on threequarters of a gallon of petrol, and to be a good hill-climber. It is also interesting to note that it competed with success in company with motor bicycles of higher horse-power in the 1907 Tour de France. Its weight is stated to be but 64 lbs.

In addition to the above complete machines, there were a Siemens and Schuckert electric delivery tricar, which was described and illustrated in *The Motor Cycle* of February 5th, page 102, shown by the Electric Vehicle Co., 1, Earl Street, Westminster, S.W. Also, a 3½ h.p. Rex and a 3½ h.p. Phänomen, the latter with a Bosch magneto placed in a horizontal position, behind the crank case and under the bottom bracket, well out of the way of mud and wet, shown on the Service Co.'s stand.

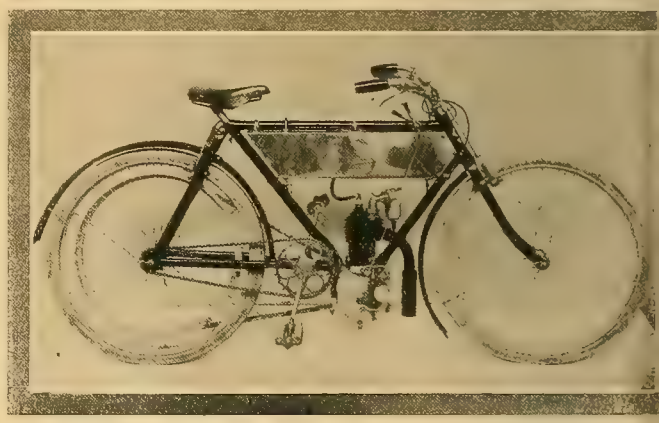
W. and R. Jacobs had also succeeded in unearthing one or two novelties, among which we may mention a small adjustable wrench of British manufacture, 2¾in. long—a very handy little tool for the manipulation of electrical fitments. A neat handle-bar switch made in two types, one for a magneto and the other for accumulators; and a trembler coil with the trembler set horizontally, which renders the platinum points very accessible. Another useful item to be seen on this stand was a neat terminal, fitted with a clip working on the principle of a patent glove fastener, so that it can be attached instantly to a cable.

Avery and Roberts, toolmakers, Liverpool, also showed some useful accessories. Their Auto patent ratchet spanner is certainly a useful tool, as are also their nut pliers, which serve for tightening up small nuts and also as wire cutters and ordinary nippers. They also exhibited what they term a "round the corner" screwdriver for getting at inaccessible screws, and a neat contact file in a small case, which also serves as a gauge to test the correct amount of break between the platinum points on a magneto contact-breaker.

Woodgates Bros., Tiverton, showed their celebrated Patch-quick patches and solution, which are claimed to repair punctures far more effectively than is the case with ordinary patches and solution, while it is interesting to note that they specially look after the interests of motor cyclists by making up small repair outfits which can be conveniently carried in the toolbag.

Hayes's Jack-no-skid anti-side-slip device has been on the market for several years, and has been greatly improved recently. Its weight has, we understand, been reduced fifty per cent., it is automatic in action, easily attached to machine, and has been reduced in price. Mr. Hayes, Ball's Pond Road, N., was showing the Jack-no-skid at Agricultural Hall last week.

We beg to remind our readers that with reference to Douglas motor bicycle sold by Cox, of West Norwood, H.



The new Werner Lightweight, bore and stroke 60 x 70 mm.

Rose, Limited, Frith Street, Shaftesbury Avenue, W., the London agents.

R. W. Corn, Ltd., aluminium and general founders, wh excellent repairs to castings of all kinds are so well know were showing at their usual stand near the main entrance

The illustration herewith is that of a section of the Th Spires non-skid motor cycle tyre. It is claimed that the s wings come into action directly the machine begins to and is inclined to skid. The firm responsible for the introduction of this tyre is the Coventry Rubber Co., Coventry, which company holds the opinion that what is wanted is a good wearing surface of rubber and ridges or wings at the side to prevent skidding when the machine leans out of the perpendicular. It will be noted that the tread of the tyre is quite plain. The usual flap is provided to cover the spoke heads and prevent damage to the inner tube. There is no doubt that it is an advantage if the non-skidding portion of a tyre is situated at a point where it cannot be worn away by friction caused by cont with the road, and we shall watch the developments of t tyre with considerable interest.

QUESTIONS & REPLIES

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and, whether intended for publication or not, **must be accompanied with a stamped addressed envelope for reply.**

Rubber Belts on Small Pulleys.

I have a lightweight machine geared 5¾ to 1 on which I use a rubber and canvas belt. Have had several of these, as they are continually giving way at the linkholes owing to the small diameter pulleys. It seems to me a more flexible belt is required. Kindly say what you advise?—J.B.F.

One of the most flexible leather belts is the Watawata, sold by O. and W. Ormerod, Ltd., Rochdale, and we should advise you to try a belt of this make on your machine.

Reducing Possibilities of Ignition Troubles.

I have bought a Trimo with 5-6 h.p. twin-cylinder air-cooled Peugeot engine, fitted with a make and break contact and trembler coils. There are eight platinum points to keep clean and adjusted, and the contact breaker is difficult to get at. Would a wipe contact make it easier to start and keep in order? Which do you consider the best wipe contact suitable for this engine?—F.G., W.C.

The best way out of the difficulty would be to have a plain coil and M.O.M. contact breaker, thus reducing the number of platinum points to six.

Hot Air Pipe and Non-skid Covers.

Is it necessary to have a tube from the exhaust box to the carburetter? My Wolf machine has not one (Longuemare carburetter), but goes splendidly. It consumes a lot of petrol, and I wonder if by fitting a tube it will make the petrol give off more vapour and so save petrol. I should like your opinion of a non-skid band. Which do you think is better, a rubber or a steel-studded one?—N.H., Cornwall.

If the machine runs really well it is better to leave things alone. Fitting up the hot air pipe from the exhaust box to the carburetter would only make matters worse as regards petrol consumption. It is only needed in very cold weather, and then only if the carburetter is set away from the engine. You might improve the consumption slightly by fitting an extra air inlet or enlarging the present one on the machine. It is difficult to say which is the better, rubber or steel. Time alone will show. If anything, we prefer the rubber; they certainly minimise the risk of sideslip, and are more comfortable than steel-studded tyres.

A Quiet Silencer Desired.

Please give me your opinion as to the best silencer for a 9 h.p. two-cylinder motor cycle (only one wanted). I have had the misfortune to come into too close proximity with the police, and I put it down to my machine being very noisy, and the untechnical brains of the police, as their theory is, "much noise great pace."—J.P.

We do not think such a thing exists as a "best" silencer. We should advise you to consult the following makers: Sharpe's Universal Patents, Ltd., Fleet House, Fleet Street, E.C., and G. Aldington, Haydon's Park Road, Wimbledon.

A Machine for Sidecar Work.

I want your candid opinion of the best clutch and speed combinations. If I order a Roc with a 6 h.p. J.A.P. engine would it be advisable to fit two-speed gear? In any case, I shall have a clutch, but have had no experience of gears, so perhaps you will inform me which is the best. I shall probably use a sidecar considerably. Do you prefer the epicyclic gear to the other kind?—F.C.P., Cambridge.

If you choose the machine mentioned in your letter and use a sidecar you will find a two-speed gear advisable. Epicyclic gears, if properly made, are quite satisfactory on motor bicycles. What other kind do you refer to? there are so many. Please send a list of gears, and we shall be pleased to place them in order of merit. See rule above.

Protection from Wet.

I am purchasing a 1908 3½ h.p. Triumph motor bicycle, and am desirous of obtaining some celluloid shields to protect the legs and body from the wet. Could you inform me where I should be able to secure these? I believe I have seen some reference in *The Motor Cycle* to shields of this kind. In addition to the shields for the legs I desire to obtain one to fix on the handle-bars to protect the body, similar to the screen used on motor cars.—G.H., Eastbourne.

Probably such shields as you desire can be made for you by Messrs. Bluemel and Bros., City Road, E.C. You had better, therefore, correspond with this firm. You could have a screen on the handle-bar, but to keep the legs and feet dry you could not improve on a wide leather splashguard, see *The Motor Cycle*, November 13th, 1907, page 904. With long overalls to fit over the ordinary trousers or breeches (fawn ones look smart), and with a waterproof coat and a sou'-wester, you could practically defy the elements.

Silencing Engine More Effectively.

My twin-cylinder air-cooled tricar is not so silent as I should wish, and I want to fit a more efficient silencer. I propose a 2in. diameter tube from the front cylinder to the back one, extending rearwards. There is plenty of room for a large silencer, so do you think I should gain anything by fitting a silencer for a 7 h.p. engine, although my engine is only a 5 h.p.?—T.G., Hull.

We should recommend you to fit separate exhaust pipes to each cylinder, and make the bends in the pipes as gradual as possible. This will enable the engine to run cooler, as also will fitting a large silencer, which gives room for the expansion of burnt gases.

Various Interesting Queries.

(1.) Will a 26in. by 2¼in. Goodrich rubber-studded tyre fit rim suitable for Clincher tyre (machine 3½ h.p. Triumph)? (2.) I should like to join the A.C.U. What preliminaries would be necessary? I do not belong to any club at present but C.T.C., and I am not acquainted with any member of A.C.U. (3.) Can motor cyclists who are not members of M.C.C. take part in London to Edinburgh run? (4.) I believe I have read that solution of sulphate of soda will remove carbon deposit from inside of cylinder. Is this correct? and if so, what strength of solution should one use, and how should one proceed to use it?—C.F., Preston.

(1.) The tyre in question is suitable for Clincher rims. (2.) Fill in the proposal form (see page 5, this week), and send it to the secretary, Auto Cycle Union, 18, Down Street, Piccadilly, W. (3.) Entrants for the London-Edinburgh run must become members of the Motor Cycling Club. The hon. sec. is Mr. Arthur Candler, 1, Lime Grove, Shepherd's Bush, W. (4.) The one and only method is to scrape the deposit off with a long screwdriver.

Concerning a Twin-cylinder Mach-ne.

I should be glad if you could help me concerning a 5 h.p. Vindec, 1906 pattern. (1.) When started it picks up on one cylinder and until it is given a stroke of the pedals does not fire on both. Once started on both it behaves all right until I have to slow the pace considerably, when it goes back to one again. I fancy it is the back cylinder. Oleo plugs quite clean. The magneto may perhaps want remagnetising, for it never used to behave in this way. (2.) New rings, etc., were fitted last October. Compression poor now. Should I fit new ones again? Only two were renewed in each cylinder. It should not require reboring. (3.) The Longuemare carburetter is constantly dripping at the air inlet, though the level does not seem to be too high. (4.) What gear should I use? I have an adjustable pulley (Vindec), but a ⅞in. back belt rim, 18in. in diameter, does not allow me a higher gear than 4¼ to 1, because the pulley is made to take a 1in. belt.—C.H., Cambridge.

The fibre ring of the magneto contact breaker is probably worn. The rocking arm on which one platinum point is mounted may also be worn. If you renew these two parts we think you will find that the trouble will disappear, but if this is not the case write to us again. The high tension carbon brushes should occasionally be taken out and cleaned with fine sandpaper at the contact end. You can soon find out which cylinder is misfiring by holding down one of the inlet valves in turn by the spring plunger at the top of the inlet dome. The dripping of the carburetter may be prevented by carefully grinding in the needle with oil and crocus powder. The gear is about right unless you are very light.

Strength of Inlet Spring, Carburetter Adjustment, and Position of Plug.

(1.) In a 3 h.p. Fafnir engine what force should be required to open the automatic inlet valve? On an engine of this make which I am now using a weight of 17 oz. is needed to just depress the valve off its seat. This seems excessive, and will, I think, throttle the mixture appreciably, at low speeds at any rate. I tried adjusting it to open with a weight of 4 oz., but gas appeared to blow back into the inlet pipe. (2.) The Longuemare carburetter has a 24 mm. cone and a 10 slot jet. It works quite well, but only runs about eighty miles to the gallon. What size cone and jet do you recommend with this size of engine (75 by 80 mm.)? A smaller jet with the 24 cone causes misfiring I find. (3.) In the same engine the sparking plug is in a recess which is connected with the combustion chamber by a small hole. This will, no doubt, stop sooting of the points, but will, I should think, prevent firing of weak mixtures owing to the products of combustion left in the spark plug recess. Do you think that a plug in the centre of the cylinder head in place of the compression tap would give better results?—J.P., S.W.

(1.) We would suggest a weight of about eight to twelve ounces. (2.) If the machine works well with a 24 mm. cone and 10 slot jet it would be as well to experiment with an extra air inlet, so that you can give the engine as much air as possible without making it misfire. This should reduce the consumption to a considerable extent. The exact size cone and jet can, of course, only be found out by experiment. The level of the petrol makes a difference to the amount of air required. A similar engine to yours that we know of runs perfectly with a 6 jet and 18 air adapter. (3.) We do not think you would gain anything by altering the position of the sparking plug on this engine, but it might be possible to fire a weaker mixture in that way.

Cause of Misfiring in Twin-cylinder Engine.

I have a 6-8 h.p. Fafnir engine of the overhead mechanical inlet type. It needs a lot of petrol squirted into the cylinders to start it, and then it will only run at a very high speed, continually misfiring, and running sometimes on one cylinder and sometimes on the other, but rarely on both at the same time. Every mechanical part is perfect. The timing is absolutely correct. I have tried a new carburetter (mine is a Longuemare), a new contact maker, rewired the whole system, and fitted an extra earth wire to the half-time shaft, but without any signs of improvement. The cylinders fire at an angle of 180°, and I have tried a different mixture for each cylinder without success. The sparking gap on the plugs is some distance from the combustion chamber, the sparking plug hole being deep on account of the water jacket. Is it possible that on this account the explosion gases do not find their way to the plug?—N.M.M., I. of W.

The engine in question is a good one and the position of the spark in no way affects the running. It is highly probable that the misfiring is due to the amount of opening of the inlet valves being different; that is, one or other of the tappets require adjustment. If this is not the case, the trouble is likely to be caused by the carburetter being badly adjusted. The symptoms described seem to show that the carburetter receives too much air at slow speeds, and that a smaller choke tube is required.

READERS' REPLIES.

I notice a query from A.M., Hanley, relating to a mysterious trouble. It may interest you to hear that I had an almost identical problem set me the other day by a 9 h.p. Riley car. The car would start off readily and run perfectly for a mile or two, or sometimes less, and then, without any misfiring, it would slow down and sometimes stop dead. Half a turn of the starting handle was sufficient to set it going again, when it would run well for a time, but sooner or later the same thing would occur. I tested the plugs, looked to the wiring and contact maker, cleaned the jet, and tested the petrol pipe for obstructions, but with no result. At last one day, while trying in vain to hit on the cause, I discovered it by an accident. The engine was running in a weak sort of way for no apparent reason, and as I walked round the machine I happened to catch hold of the low tension wires from coil to commutator, when immediately the engine started racing with all its old power. The fault was due to an invisible defect in the insulation of the low tension wires, causing an intermittent short circuit. The curious part of the affair was that the engine never once missed fire.—CYRIL A. POTTS.

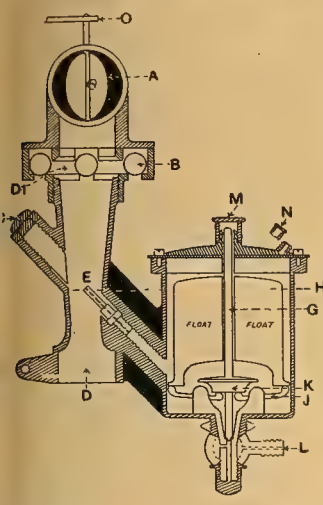
In your issue of February 19th, 1908, I see someone who signs himself "Amateur," Middlesex, has an erratic running engine. Well, I have had just the same symptoms myself with a 3½ h.p. Brown. What I want to say is I found out the remedy for mine, which answers well. The reason was this, in starting I injected paraffin and got it to fire all right. This paraffin to a certain extent washed the cylinder walls, and most important the air-cooled oil (Price's) in crank chamber is so thick and solid that it clings to flywheels, etc., and won't splash up well under a couple of miles, that is, until crank chamber becomes warm. My remedy is this. I jack front wheel up on an empty petrol can, and put a small paraffin lamp under crank chamber and let it burn half an hour to warm it up. This warms up the cylinder as well, and the result is no paraffin injections, no engine kicking, no trouble—goes like a train. I find this a perfectly safe method if there are no leaky joints, etc., for petrol to vaporise. I wrap carburetter up in a damp rag. Of course, another remedy is thinner oil to be used in winter, but I prefer the thick oil and warming up process.—P. G. JACKSON.

"Puzzled" writes: "My machi is a 1907 four-cylinder F.N., a the fault was in the conta holder. The hole that is drill in the contact holder for carbon bru spring had been drilled twice, and l a groove, so that the spring got fix in it, and the carbon brush only ma contact with the brass disc for th of the cylinders, and kept missing t disc for front cylinder contact owi to disc No. 1 being a little below t distributer. I filed the groove of c bon brush holder, lengthened t spring, took out No. 1 brass disc, a fitted a thin carbon ring which ma it perfectly level. The machine l been O.K. ever since. I am mu obliged to Mr. A. Stallybrass a yourselves."

"THE AUTOCAR," which i published under the same p prietorship as "The Motor Cycl is to the automobilist what t journal is to the motor cycli. Any reader of "The Motor Cycl who is also considering the p chase of a car should make a po of obtaining "The Autocar"—t leading motor journal. Price Issued weekly.

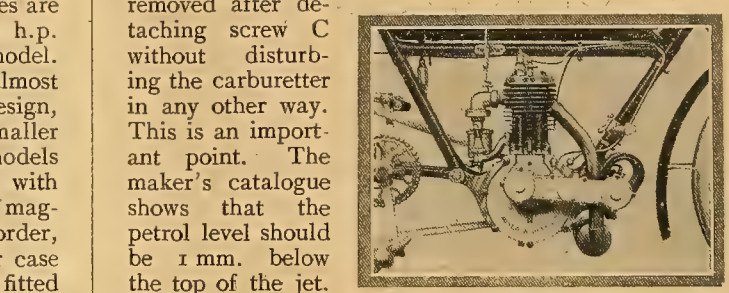
Notes on 1908 Models.

AMONG motor cycles which have been considerably improved for 1908, the Minerva calls for special mention. The design of this make is extremely neat and practical, and the prices are most moderate. Our illustration depicts the 3½ h.p. single-cylinder model. The 2¾ h.p. is almost identical in design, except for the smaller engine. Both models can be fitted with accumulator or magneto ignition to order, and in the latter case the magneto is fitted just in front of the crank chamber on a special bracket, and driven by an ingenious form of eccentric gearing, which has been the subject of a previous illustration in these columns. The 2¾ h.p. model has an engine of 76 × 76 mm., and the 3½ h.p. 82 × 82 mm., both with mechanically operated valves. The standard tyres are 26in. × 2¼in. with butt-ended inner tube to the rear wheel. There are three security bolts fitted to each wheel to prevent the tyre creeping. Detachable footrests are supported on the down tube. The standard pattern machine has rigid forks, but spring forks can be supplied at a slight extra cost. The spring fork is the already well-known Simplex pattern. The magneto the Eisemann with separate coil. The automatic carburetter shown in detail (see sectional line illustration) is made under the F. and A. patents. The method of controlling the additional air supply is interesting and original. Under the illustration will be found a lettered inscription of the various parts, which will make the following description quite clear. The mixture chamber above the jet carries a metal ring drilled with holes of various dimensions, covered by metal balls of corresponding sizes. When the engine is running slowly, the lightest ball only will be lifted from its seat by the suction of the engine, admitting only a small quantity of additional air. As the speed of the engine increases, the larger balls are lifted, thus admitting the extra air necessary.

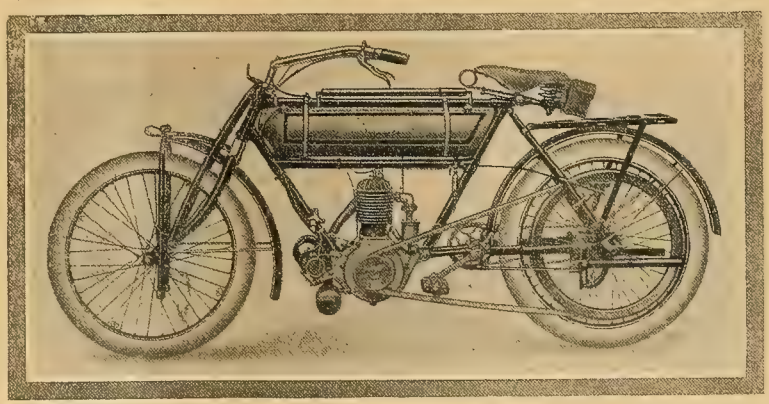


A. Throttle.
B. Balls controlling additional air inlets.
C. Screw covering jet.
D. Aperture for main air.
E. Jet.
G. Needle valve.
H. Line of petrol level.
J. Levers controlling needle valve.
K. Balance weight on needle.
L. Petrol inlet.
N. Cap to float-chamber.
M. Cap to needle valve.
O. Throttle lever.

The jet orifice is placed at the narrowest part of the conical chamber connected to the float chamber, and hot air is drawn in at the base through a funnel-shaped tube fitted close to the cylinder. The spray can be removed after detaching screw C without disturbing the carburetter in any other way. This is an important point. The maker's catalogue shows that the petrol level should be 1 mm. below the top of the jet. This can be checked by removing the screw C above mentioned. We would also draw attention to the petrol strainer on the feed pipe. When the machine is provided with accumulator ignition, two fifteen ampère hour batteries are fitted in a case behind the seat tube. Lycett's luggage carrier and Price's stand are fitted to the chain stays, bringing the machine completely up-to-date. The round tanks are an innovation this year. At the front about three pints of lubricating oil can be carried, and in the rear portion about 2¼ gallons of petrol. The consumption of the 2¾ h.p. engine is about 90, and the 3½ h.p. engine about 80 miles to the gallon of petrol. Other models are the 4½ h.p. and 7-8 h.p. twin-cylinder. Both are V type and with mechanical valves, the former being 70 × 75 mm., with cylinder and head cast separately and yoked together, and the 7-8 h.p. 80 × 85 mm. with cylinder and head in one casting. Although we have had no opportunity of riding one of the latest Minerva machines, we consider that this year's patterns are the best the company have introduced, and proves that this old established firm, the first to introduce the motor bicycle commercially into England, have not lost sight of the fact that there is a considerable demand for motor cycles, for which they are catering in an up-to-date form.



The power unit of the single-cylinder Minerva.



The 1908 model Minerva with Eisemann magneto and spring forks.

Riders of the Werner motor cycle will be interested to learn that Beard Bros., of Cricklewood Broadway, London, N.W., are in a position to supply all spare parts from stock for this particular machine.

The United Motor Industries, Ltd., 45, Poland Street, London, W., and Sherbourne Works, Coventry, now stock Stanley-Dermatine belts in all sizes for motor cycles.

Does an Air-cooled Engine Overheat?

I MUST apologise for not replying to some of the correspondents who have discussed and criticised my remarks, but it is far better to wait and reply to all criticisms simultaneously, which I have done hitherto.

The title of this discussion should have been, "Can a Motor Cycle Engine Overheat under Normal Conditions?" Certainly an air-cooled engine can be made to overheat, but my argument is that under conditions which occur on the road a reasonably designed engine does not fail through excessive temperatures, but through various other causes, each having its own and separate remedy.

Replying to Mr. Verney, who is the first correspondent, in reference to Mr. S. F. Edge's test, feeling quite sure that Mr. Verney was at fault, I wrote to Mr. Edge, who replied: "Certainly keeping the water jacket warm increases the power of the engine and decreases the consumption. In the tests you refer to, although the water came direct from the mains merely as a convenience, the outlet was sufficiently restricted to cause the water jacket to attain the temperature we thought best for the purpose of the test. I will send you shortly some tests dealing with the different powers at different temperatures." This report I have now received, and shall be pleased to show it Mr. Verney, though it has already been published in *The Autocar* and other motor car papers.

Motor Cycle Engines. A Comparison.

Another correspondent has corrected Mr. Verney as to his and my acquaintance with Boyle's Law, which has nothing to do with the subject whatever. Mr. Verney overlooks the fact that the inlet valve and other parts are not cold in a water-cooled engine, and that the incoming charge probably is expanded as much in one engine as in the other, though I imagine that this expansion is very small in motor cycle engines, due to the high speed at which the cycle of operations is carried out. Air is well known to be most difficult to heat, convection being practically the only way to effect it. Just how the gas is heated so quickly in the fraction of a second to effect any serious reduction in volume is not quite clear. Gas engineers talk about reduction of charge, and quite correctly, as they are dealing with considerably larger volumes, larger heating area, and longer periods. This partially replies to Mr. Nevill.

I had a gas engine similar to Mr. Verney's, and when under load, if the engine commenced to pick up speed suddenly, and consequently deliver more power, I knew at once that the water circulation was failing. Here my engine was developing more power when overheating! As the circulation was by thermo-syphon, I was unable to run the engine warm enough to obtain maximum power, *vide* Mr. Edge's tests, in which he finds 150° F. in the engine under test give the best results. Mr. Verney's remarks as to vaporisation in the carburetter being the reason why engines do not give their power until warm are not correct, except where the carburetter is water-jacketed. There are a large number of causes, in which vaporisation is one of the smallest. In my car engine the induction pipe becomes covered with frost when and after the engine has "warmed up," whilst it is at a normal temperature before starting. The carburetter is heated in no way whatever, but due to vaporisation is colder when running than otherwise. It runs better when warm than cold, and chiefly because less heat is lost to the water-jacket and more converted into useful work.

Air-cooled Engines in America.

To "Interested" I would point out that there is a difference between sufficient lubrication and smoke pouring out of the silencer. Radiators and water jackets are provided on a car because it is inconvenient to fit air-cooled engines. In America air-cooled engines of quite a large size are used successfully. They entail a special kind of bonnet, which allows air to impinge on all the cylinders, and special fan arrangements for supplying a blast of air to the engine. It is outside the present question, but I am perfectly convinced that air-cooling is practicable on cars. It is ridiculous to suggest that I drive without radiators, as the car would then be operating under abnormal conditions. If "Interested" had read my original article he would not have made these remarks.

To Mr. A. W. Browne, whose remarks are to the point, I reply to his three suggested causes. To (1) I would refer him to my remarks above bearing on high engine speed, difficulty of heating gases under any conditions whatever, and absence of the best condition for heating them. (2.) This runs parallel with my suggestion of insufficient lubrication. I am inclined to think that Mr. Browne is right, and that where I found increasing the lubrication remedied the trouble it might be due to the oil in the engine deteriorating with some classes of oil. (3.) Preignition. This I have suggested as the cause of the engine stopping on hills, but I do not call it "overheating"; I call it "pre-ignition." It is either due to some part becoming incandescent or to exhaust retention, the remedies being obvious.

Some Fallacies take a lot of Killing.

I am glad to note that "H.M." is inclined towards my opinion, that is to say, that many other troubles are attributed to overheating, and it is the cloak under which the ignorant cover their mistakes. I thank him for correcting Mr. Verney. The same mistake was made in a discussion on overheating some years ago.

Replying to Mr. Nevill, who goes into the question at some length, I am not by any means trying to upset gas engineer's theories. With reference to Mr. Roots's experiments, I have no recollection of it being said that the engine was under load at the time. The important point was omitted by Mr. Nevill in his article. Hence in my opinion there was no connection between engine speed and power. In any case the increase in power would not be noticeable on a motor cycle engine. Thirteen revolutions per minute increase is not a large percentage, although I am aware that Roots's engine ran at slow speed, and I do not think the result would be noticeable on a motor cycle engine. I fancy Mr. Nevill will find that the engine was a two-stroke one. However, I am not trying to argue that a hot charge is better than a cold one, as it is well-known not to be. What I do say is that Mr. Roots's experiments do not show that the ingoing charge is heated to any great extent in a motor cycle engine. The experiments were carried out many years ago before the present type of engine existed, and my opinion is that

Does an Air-cooled Engine Overheat?

in the time, the gas has very little chance to expand under temperature to any appreciable extent.

High Engine Speeds Compared.

Undoubtedly in gas engines running at slow speeds there is a considerable volume taken at each stroke, and when running at slower speeds its expansion is noticeable. This is why gas engine designers have to consider the feature, whilst I think petrol motor engineers can ignore it. With reference to the high speed of the J.A.P. engine, if this does not satisfy Mr. Nevill I would refer him to the Coupe des Voiturettes of last year, in which the Sizaire et Naudin won, the engine speed averaging 2,100 r.p.m., and often running as high as 2,500 r.p.m. This with a bore and stroke of 100 × 120 mm. Also the T.T. Triumph at Brooklands with its engine speed of 2,500 r.p.m. If these engines can run at such speeds, and develop good power, the one for a long race, surely exhaust retention should not present much difficulty to motor cycle engineers with their smaller volumes. Indicator diagrams may be obtained to prove any point, and the fact that Mr. Nevill found exhaust retention to be an important feature in one engine does not prove its presence in many other engines. Some gas engineers think that a small amount of exhaust gas retained is a good feature; for instance, Mr. Grover. This theory, however, is not generally accepted.

I agree with Mr. Nevill's definition of overheating, which is a fairly obvious one, but does not go much further. Certainly one can make an air-cooled engine overheat, but in my opinion an engine on a motor cycle, under the conditions it works, does not ever stop from any cause such as overheating, which cannot be remedied.

Mr. Dugald Clerk's remarks deal with gas engines and not with motor cycle engines. The difference lies in the speed and volume of charge.

E. W. WALFORD.

In Next Week's Issue we hope to publish an article by a T.T. competitor explaining why an air or water-cooled engine overheats.—Ed.

HINTS AND TIPS FOR MOTOR CYCLISTS.

By Road Rider.

(*Continued from page 243.*)

THE EXPENSE OF MOTOR CYCLING (continued).

DEPRECIATION.

Any machine will depreciate twenty-five per cent. in value at the end of one year's riding. For those who do not want the most expensive and latest thing on the market there is a method for avoiding depreciation losses, and it is to buy a machine of the previous year. For example, I sold a 3 h.p. machine for £25 two years ago; the then purchaser has just sold it and obtained £26 for it. To avoid depreciation, therefore, buy second-hand machines of the best make. This advice is for the rider whose purse is shallow.

Supposing, therefore, that an aspiring rider starts his first year with a sound 2¾-3½ h.p. motor bicycle of good make, his balance sheet for 5,000 miles will be as follows.

	£	s.	d.
Fixed expenses	5	16	8
Spares and accessories ...	2	9	6
	£8	6	2

If he has battery ignition he must add a little for recharging fees. If he is not willing to study a handbook like "Motor Cycles and How to Manage Them," and to thresh out every difficulty on the road or at home unaided, till he has mastered the sport, he must add an unknown sum for professional assistance, but if his machine is a fair sample of the best makes this sum will never exceed £2 in the distance, unless he is a great fool.

The second year there will be required in addition to the above, two new tyres complete at £3 12s. the pair, another new belt 12s., oddments, say, £1. Total £5 4s. Deduct from first year's expenses the cost of the lamp and horn (£1 1s.), and the second year's bill will be £12 9s. 2d.

The above figures are not a dream of the enthusiast's brain, and they make it obvious that if *motor cycling be pursued on strictly penurious lines* it is the smallest of extravagances, and may even be for many business men an economy. There are motor cyclists who take their machine to a repair shop for every tiny adjustment, buy an expensive outfit of clothing, break a pair of goggles once a month, and so on. But there are enthusiasts who indulge in the sport at no greater expense than I have described, even though their machines are second-hand, and picked up at a bargain figure.

FILLING TANK WITH PETROL.

186. Always use a funnel with a strainer.

A good funnel has an inturned edge to prevent splashing.

A good funnel has an air escape groove down the stem.

A good funnel will hold water on its gauze strainer.

The most useful thing for the purpose to carry with one is a petrol pourer, made to screw on to the spout of a two-gallon can.

If the petrol can be held with its spout in the uppermost corner the air valve in the spout will act—not otherwise.

FILLING TANK WITH LUBRICATING OIL.

187. A weary business, since the oil is usually so thick and the aperture so small. Stand the oilcan on the top of a stove not too close to the fire for a few minutes first, and use a big funnel, which may be left with a quart of oil in it, to trickle through at its leisure. Tank makers should see that as large a filler as possible is provided.

FIRE AND MOTOR CYCLES.

188. Petrol vapour when mixed with air is extremely inflammable. Lamps and smokers should never be allowed near when spirit is being poured or leaking. If the carburetter catches fire the first thing is to shut the petrol tap—simple, but often forgotten. The flames can then be beaten out with a cap, or smothered with a rug or jacket.

Avoid machines on which the electrical wiring passes near or under the carburetter.

Avoid machines on which the exhaust pipe or silencer comes directly under the carburetter; there are many such, and a few of them are annually burnt.

Water only spreads a petrol fire. Use sand, mud, road dust, coat or cap.

Always keep a big bucket of sand in motor cycle shed.

GEAR RATIOS.

189. It is immediately obvious that the same gear cannot possibly suit Devon and Lincolnshire, summer and winter, an eight stone rider and a fifteen stone rider. Therefore, until every machine has either a variable gear or an adjustable pulley, each purchaser should select a gear suited to his weight, the season of the year (low for winter, high for summer), and the nature of the country he rides in. Small engine pulleys cause belt slip, and are unfortunately rather severe on the belt. The following gears are recommended for single motor bicycles, either separately or in combination, if a variable gear be fitted.

H.P.	Summer gears. Average.	Heavy	Lt.	Winter gear.	Second gear, if any.
3	5	5½	4½	lowest practicable	8½
3½	4½	5½	4	,, ,,	8
5 (twin)	4½	5	4 or 3½	,, ,,	7½

The terms "average," "light," and "heavy" refer to the rider's weight. The above gears are founded on long experience and practice, and apply to motor bicycles with 26in. wheels. Increasing the size of the wheel has the same effect as increasing the gear, and *vice versa*.

(To be continued.)

CURRENT CHAT.

Special Features.

MOTOR CYCLES ON BROOKLANDS.

CLUB NEWS FROM ALL PARTS.

The Motor Cycle" Spring Number.

May 6th is the date on which the special spring number of *The Motor Cycle* will be published. Special articles and illustrations are being prepared for this issue.

Barnes and the Grand Prix.

We hear that George Barnes will not drive one of the Austin cars in the Grand Prix Race, as was stated in a French contemporary. He will probably be seen at the wheel of another British make that will be a late entry.

Date fixed for End-to-end Run.

It has now been announced that the A.C.U. Land's End to John-o'-Groat's six days' ride will commence on Monday, July 13th. Further particulars of this event, which promises to be even better supported than in 1906, will be published shortly.

Brooklands Motor Cycle Race.

The regulations for the first motor cycle race at Brooklands at Easter are simple enough, and on account of the entrance fee being low there should be a splendid entry. Cash prizes and a cup or medal are offered at the winner's option.

Particulars of the Race.

The B.A.R.C. has circulated the following particulars: The First Brooklands Motor Cycle Race of 25 sovs. (20 sovs. or a cup to the entrant of the winner, at his option; 5 sovs. or a medal to the entrant of the second, at his option.) For motor bicycles of which the engines, if twin-cylinder, do not exceed 80 mm. by 98 mm. for each cylinder. Distance, about 5½ miles. Entrance, 10s., p.p. (Twenty entries, or the race may be void at the option of the Executive. The Supplementary Regulations approved by the Auto Cycle Union shall apply to this race.)

Motor Cycle Races at St. Albans.

At a meeting of the St. Albans Athletic Club recently, writes Mr. D. R. Clarke, it was decided to cater for the motor cycle more so than in the past, and it is definitely settled there will be three motor cycle races, each of five miles, and each having a first prize of £5, second (if three starters) £3, and third (if five starters) £2. One is a tourist race confined to a radius of five miles round St. Albans, the two others being racing machine events, one a scratch and the other a handicap. The track is 2¾ laps to the mile, and, the banking being moderate, fair speeds are possible of attainment.

A Trap in Kent.

Last week the police commenced operations with a trap at the entrance to Hadlow village, Kent, at the Maidstone end.

Oxford v. Cambridge Motor Cyclists.

The above match will not be held on Brooklands track, as the teams decided that it would be an inconvenient venue in term. The competition will be at Sharpenhoe on May 30th, and the Cambridge team will be as follows:

Cambridge	v.	Oxford.
One 7-9 h.p.	v.	1 ,,
One 5-6 h.p.	v.	1 ,,
Two 5 h.p.	v.	2 ,,
Two 3½ h.p.	v.	2 ,,
One lightweight	v.	1 ,,

It is proposed to make this event an annual one.

The Open Hill-climb on Saturday.

We are now in a position to divulge the name of the hill on which the Lewisham A.C. will hold its open hill-climbing competition for motor cycles on Saturday next, the 4th inst. It is Carter's Hill, a corresponding ascent to River Hill, but not very easy to locate.

How to reach Carter's Hill.

A correspondent describes the best way down to the hill. The Sevenoaks Road is followed to the crown of River Hill, where the byroad at the danger-post is taken. This skirts Knowle Park, and is a most picturesque bit of road densely wooded on either side. Another byroad that might easily be passed unnoticed is met. The club should sprinkle confetti at this point, thus indicating the route. The run to the hill is charming. It is a twisty road through woody country, and the scent of the pines is all round you. Of human or animal life there is none. Nought is heard save the beat of your engine and the roar of the spring wind through the trees. There is a glimpse of open country through a screen of woodland. A turn of the road and a steep drop awaits you. It is Carter's Hill.

What he Found in the Carburetter.

A Wiltshire reader sends us a post-card he has received from a friend, the contents of which are very funny. The postcard reads: "I took carburetter down yesterday in a last effort to remedy misfiring, and found therein twenty-four lumps solder (assorted), one piece rope, portion of hair mattress, one boulder (granite), one boulder (flint), seven pieces of bone, child's teething ring, quantity of Watson's Matchless Cleanser, two gills best Vacuum oil (the oil that lubricates most), iron and brass filings (assorted), quantity manure (liquid and solid), and piece of oak tree. After that I expected to find a threepenny piece with a hole in it, but was very much disappointed not to."

A Curious Error.

A local paper points out that the ten miles limit board at the London end of Bromley is erected on the wrong side of an adjacent lamp-post, so that only the plain side of the warning board is illumined. As such, it is unnoticeable after dark.

The Motor Cyclists' Ideal.

We had hoped to be able to announce something definite with regard to "The Motor Cyclists' Ideal," but such a large number of forms having been returned by readers duly filled in, it will take some time to go into each reply separately. We refer to the matter in a leaderette this week.

Sidecars Increasing.

It is not difficult to notice the increasing popularity of the sidecar attachment. On a short run recently we noticed five passenger attachments of this nature. There is no doubt a sidecar attachment has many advantages, not the least of which is the fact that on one pattern at least it can be instantly attached and detached, rendering the usually difficult storage an easy matter. Users of rigid sidecars who complain of difficulty in steering should check the alignment of bicycle and sidecar wheels. Unless all are perfectly in track there will always be difficulty in steering. Old motor tricyclists can manage to steer the fixed pattern sidecar the best.

The New Sport.

Extract from Mr. H. G. Bell's paper "The Future of Motor Cycling," read before the Auto Cycle Union on Feb 28th, 1908: "I do not mean that they were bumpy, but greasy. From the Strand I slipped down to the Embankment."

A new delight, ye motor men!—
Bestride the speedy light F.N.
And go a-sliding.
A new delight, a fearsome treat,
A fresh and wondrous sort of feat—
A joy abiding!
Slip from the Strand to the Embank-
Ment, then slip back again and thank
Good Mr. Bell—I'm sure you ought—
For teaching us this novel sport!

—F.G.

The Brooklands Motor Cycle Race.

Entries for the motor cycle races on Brooklands Track at Easter should be forwarded to the Brooklands Automobile Racing Club, Carlton House, Regent Street, W.

American Motor Cycle Records.

An American journal waxes exceeding wrath in a leaderette because of the statement in a recent issue of *The Motor Cycle* that the Auto Cycle Union has not hitherto recognised motor cycle records created in America. It would be a good thing if the same journal would devote the same amount of space to a leaderette explaining why American motor cyclists will be made professionals if they compete in the private owners' class in the Land's End to John-o'-Groat's Run next July.

Actress secures £75 Damages.

Miss Francis Joan Walbran, an actress, was awarded £75 damages against a motor cyclist, Mr. Algernon Wright Cox, the Orchard, Maidenhead, in the King's Bench before Mr. Justice Lawrance and a special jury on Wednesday last. Riding his motor cycle Mr. Wright Cox collided with the back wheel of Miss Walbran's pedal bicycle while she was turning a corner in Bridge Street, Maidenhead, on July 24th last.

Grapperon's Tour de France.

Grapperon, on the Alcyon motor bicycle, has nearly completed the Tour de France (6,000 kilometres). He is expected back in Paris next Sunday.

Suggested Motor Cycle Races at Birmingham.

We have received the following letter from Mr. Chas. Wheelwright: "I beg to advise you that the *Sport and Play* cycle tournament has been fixed to take place at the Aston Villa Ground on Saturday, May 23rd. Provided the promise of sufficient support is forthcoming, we propose including two motor cycle events in the programme, with good value prizes, but before doing so should like to be satisfied that we are likely to secure a satisfactory entry, so as to make the races interesting to the public. Also, I should be glad to have the opinion of those interested as to the bore and stroke of engines to be admitted into the competition." Replies to this letter should be sent direct to Mr. Wheelwright, at Lucifer House, Lionel Street, Birmingham.

Annual Inter-club Meet at Richmond.

Richmond, Yorkshire, the venue of the 1907 monster meet of motor cyclists, has been selected again for an inter-club meet of Northern motor cyclists on Good Friday. The following clubs will take part: Middlesbrough, Leeds, Bradford, Sheffield, and Newcastle, and all other clubs in the North are invited to co-operate. Mr. Bernard Read, hon. sec. of the Bradford Club, suggests that this inter-club meet should be made an annual event. Bradford motor cyclists are anxious to improve their acquaintance with fellow riders, and consider this a fitting opportunity.

The next Paper before the A.C.U.

On Friday week, the 10th inst., Mr. Arthur Candler, the hon. sec. of the Motor Cycling Club, will read a paper on "Motor Cycle Touring" before members of the Auto Cycle Union. Mr. Candler has had a very wide experience of motor cycle touring, both in the United Kingdom and on the Continent, and descriptions of tours from his pen have appeared in *The Motor Cycle* from time to time. Tickets of admission may be obtained of the secretary A.C.U., 18, Down Street, Piccadilly, W.

FUTURE EVENTS.

April 4—Lewisham A.C. Open Hill Climb for Motor Cycles on Carter's Hill.
" 16-20—M.C.C. Easter Tour.
" 18 and 20—Brooklands Car and Motor Cycle Races.
" 19 (Easter Monday)—Lincolnshire M.C.C. Hill Climb.
" 22-28—Auto Cycle Club of France Reliability Trials.
" 25—A.C.U. Quarterly Trial.
" 25—Hertfordshire County A.C. Open Hill-climb for Motor Cycles.
May 2—M.C.C. Members' Hill-climb.
" 9—Brooklands Motor Races.
" 9—Essex M.C. Open Hill Climb.
" ——A.C.U. Annual Hill Climb.
June 5-8—M.C.C. London-Edinburgh Run and return for Schulte Cup Competition, and special cup for motor bicyclists.
" 27—M.C.C. Inter-team Trials for "The Motor Cycle" Challenge Cup.
" ——A.C.U. 24 Hours' Ride.
July 4—Essex M.C. Open 200 Miles Non-stop Run.
" 13-18—A.C.U. Land's End to John-o'-Groat's Six Days' Reliability Trial.
" 25—Motor Cycling Club's Petrol Consumption Tests.
Aug. 3-4—M.C.C. Run from London to Land's End and Back for Charles Jarrott Cup.

Members of the Motor Cycling Club starting from Purley Corner on the occasion of the opening run to Brighton on Saturday last.

The Motor Cycling Club.

Week-end Run to Brighton.

SHORTLY before three o'clock on Saturday afternoon last the members of the M.C.C. began to muster at Purley Corner for the annual week-end run to Brighton. The weather prospects had been anything but promising, but notwithstanding the unfavourable outlook by about 3.30 some forty members had assembled at the starting place. After going through the ordeal of being photographed, a start was made for Crawley, where the captain, Mr. E. B. Dickson, had made arrangements for tea at the George. In spite of the rain of the previous night, the roads were found to be quite good, and Crawley was reached in good time. At the George the club found several members of the Brighton M.C.C. awaiting to accompany them into Brighton. The run from Crawley to Brighton after tea was most enjoyable, the roads by this time having completely dried, the only incident worth recording being that one member, forgetful of the ten mile limit at Handcross, was interviewed by the police. Headquarters at Brighton were, as usual, at the Old Ship, where about sixty members and friends assembled for dinner in the evening, the president of the club, Mr. Chas. Jarrott, being in the chair. With the exception of welcoming the president to the opening run, and proposing his health in a brief and suitable manner, no speeches were made. This allowed the members ample time for a stroll on the sea front. After the good run from town, an excellent dinner, and with the barometer rising, everyone appeared happy and anticipated a pleasant return journey.

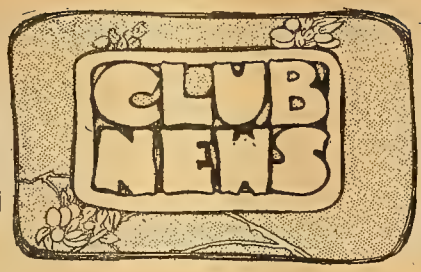
The Homeward Journey *via* Horsham.

The morning broke fine and sunny, and after breakfast the members assembled outside the hotel for another photograph, after which the homeward journey was commenced *viâ* Horsham and Dorking, a stop being made for lunch at the Burford Bridge Hotel. A good lunch was here provided, and after a smoke and a chat the members wended their way homewards to the various parts of London and the suburbs. The week-end run to Brighton and back has always been one of the most enjoyable events of the year, and the captain is to be congratulated upon the manner in which he has upheld this reputation. The hon. sec., Mr. Arthur Candler, was, unfortunately, laid up on Saturday with a feverish cold. Mr. Candler misses very few club runs. Of the motor cycles taking part in the run, there were eight Vindecs, three Triumphs, two Lagondas, and one each of the following: Brown, Bat, Quadrant, Minerva, Motosacoche, Griffon, Rex, and Werner. Of the cars, these were seven Rovers, and one each Phœnix, Deasy, De Dietrich, Riley, and Sizaire. Two members attending the run hailed from Peterborough and one from Coventry. Almost every member made a non-stop run out and home, and punctures were unheard of—an unusual thing at a big club run.

A representative group of Motor Cycling Club members outside "The Old Ship" at Brighton last week end. Twenty-one motor cyclists took part in this opening run.

ANOTHER TWENTY-FOUR HOURS' RIDE.

We notice that a twenty-four hours' ride to York and back on August 15th is included in the Essex Motor Club's 1908 fixture list. This makes the twelfth long-distance ride down for decision by motor cycle clubs this year, and goes a long way to prove the absolute reliance riders have in up-to-date motor cycles.



Sheffield and Hallamshire M.C.C.

The opening run is on Saturday next, to Retford (tea at the Pheasant); meeting place, Furnival Road, at 2.30 p.m. Riders in the district not members of the club are invited to join in the run.

Richmond and District M.C.C.

The annual dinner and annual general meeting of the Richmond and District Motor Cycling Club was held at the Florence Restaurant, Rupert Street, W., on the 24th ult. The club has decided to continue its affiliation to the Auto Cycle Union.

Brighton C. and M.C.C.

Members are reminded the opening run to Fittleworth (Swan Hotel) will take place on the 5th inst.

Motor cyclists in the district should note there is no entrance fee to join this club, and the subscription includes affiliation to the A.C.U.

The Worcestershire M.C.C.

Ten members of the above club rode to Holtfleet on Saturday last. Unfortunately, an accident occurred, which resulted in the disablement of one of the committee, so the meeting which was to have been held is postponed until next Saturday, at headquarters, the Golden Cross, Bromsgrove, at 3.15 p.m.

Bradford M.C.C.

The opening run is on the 17th inst. to Richmond to meet the Leeds, Sheffield, Bradford, Middlesbrough, and Newcastle Clubs. Other clubs are invited to join in this inter-club meet of Northern motor cyclists. It is proposed to hold an impromptu competition in the afternoon, say, a speed-judging or slow race. The Bradford Club will arrive at Richmond between 12 a.m. and 1 p.m.

North Islington Conservative and Unionist M.C.

The following gentlemen have accepted office for the above club: Patron, Sir William J. Crump, J.P.; president, Mr. George A. Touche; vice-presidents, Messrs. F. L. Dove, L.C.C., C. Kenneth Murchison, L.C.C., Councillor T. H. Day, Councillor S. E. Case, Councillor J. H. T. Reeves, and Councillor W. J. Smith.

Mr. Henry E. Davison will be pleased to send particulars of membership on application to 623, Holloway Road, N.

South-eastern Automobile Association.

The Lewisham Automobile Club has ceased to exist under this name. It has now changed its title, and in future will be known as the above, and amalgamation with other clubs is already in negotiation. Being in effect a new club, members joining at once will be enabled to do so without payment of any entrance fee.

A general meeting is being called, when the programme for the year and other matters will be arranged. Various special advantages are offered to members residing in the S.E. district. Particulars of Hon. Sec. Renner, Kidbrook Park Road, Blackheath, S.E.

North-west London M.C.C.

Perhaps the most important competition organised by this club is the twelve hours' reliability run to Coventry and back, which takes place on May 23rd next, over a course totalling 216 miles. Silver cups will be awarded to the successful competitors, and unattached riders in the North-west London district are invited to join the club and compete in the above and other competitions which are on the fixture list.

The trials hon. sec., Mr. A. S. Phillips, 84, Alexandra Road, South Hampstead, will be pleased to forward the rules to anyone applying for same. Members are reminded of the opening run to Tring (Rose and Crown) on the 4th and 5th April

Birmingham M.C.C.

The fifth annual report was presented at the general meeting held on Saturday last at the new headquarters, the Acorn Hotel, Temple Street. The club has a good cash balance in hand, despite a loss of £4 12s. 8d. on the last year's working. Sixty-two members paid subscriptions last year, as against forty-five in 1906. Ten new members were elected at the last meeting, and a number of competitions for this year arranged.

Walthamstow M.C.

The opening run will take place on Saturday, the 4th inst., to Ongar, where tea will be provided at the Crown Hotel, at 5.30 sharp. The start will be made from Greenleaf Road, Hoe Street, at 3.30 sharp. Intending members will be welcomed, and can obtain full particulars from the hon. sec., Mr. J. W. Percival, 13, Church Hill, Walthamstow. It has been decided to hold official Sunday runs, starting at 10.30 a.m. The run on the 5th inst. is to Southend-on-Sea (the Granville Hotel).

Ayr and District M.C.C.

At a meeting held recently, it was decided to form a motor cycle club under the name of "The Ayr and District Motor Cycle Club." There were twenty members enrolled. Mr. John Hourston was appointed president, and Mr. Matthew Browne, North Quay, Ayr, hon. sec.

All motor cyclists in the district interested in this movement are invited to communicate with the hon. sec. with a view to furthering the club's interests.

Essex M.C.

The opening run on the 5th inst. promises to be well supported, and it is to be hoped that all members will make every effort to attend. A start will be made at 10.30 a.m. from the Castle, Woodford Green, and lunch will be ready at 1.30 p.m. at the White Hart, Witham. Members who wish luncheon ordered should write to the captain, Mr. O. L. Summers, Southernhay, Loughton, stating their intention of taking part in the meet. Those who intend to take part in the Easter tour should attend at headquarters on Thursday, April 9th, to finally settle matters.

Western District M.C. (London).

It has been decided to hold the next competition on April 12th, the event to be a speed judging contest. The competitors to run in pairs, and must keep together during the contest and finish together. Competitors finishing without their partners will be disqualified. Route from eleventh milestone on Bath Road, continue to Henley, turn, and finish at Milford Hotel, Hounslow. Pair finishing nearest to twenty miles per hour will win. No watches allowed. A smoking concert will be held on Thursday, April 9th, at the Milford Hotel.

Black Prince M.C

The above club held a very representative meeting at its new headquarters, 624, Mile End Road, E., last Thursday evening, and after the initial business was got through, Mr. Steward, the hon. sec., was sorry to have to resign owing to pressure of business, but consented to act as chairman for this year. The following were elected on the committee: Messrs. Babbage, Bass, Booth, Webber, Crittenden, and James; treasurer, Walter Crittenden; auditor and trials handicapper, I. J. G. Babbage; captain, Thomas Andrews; delegate to A.C.U., Chas. Steward; hon. sec. (to be announced later). The following resolutions were duly passed: From this date hence the club will be known as the Eastern District Motor Club, London. Meetings to be held the third Wednesday in the month at headquarters at 8.30 p.m. The rules were revised, and runs arranged for April and May.

Club News.—

Dunedin M.C.C.

The annual meeting will be held in the Union Hotel, Lothian Road, Edinburgh, on Friday next, at 8 o'clock.

An effort was made recently to amalgamate this club with the Waverley M.C. It was thought by a large majority of the members that the union of the two clubs would tend towards the betterment of motor cycling in Edinburgh, but some disapproved of the idea, and consequently the movement has fallen through.

Middlesbrough and District M.C.C.

The opening run is fixed for Good Friday, to Richmond, leaving the Ring, Park Road North, at 8.45 a.m. A club photograph will be taken at 8.30 a.m. before starting. On Easter Monday the run is to Durham, leaving the Ring, Park North Road, at 9.45 a.m. On Easter Tuesday an open hill-climb will be held on Yearby Bank (near Redcar), at 2 p.m., open to amateurs. Entrance fee—Members, 1s.; non-members, 2s. 6d.

Hull and East Riding A.C.C.

This club held a very successful and enjoyable whist drive and dance at the Salisbury Hall, Hull, on Wednesday last, at which about 130 members and friends were present. The next event in the club programme is an auction sale of members apparatus, to be held before Easter.

On Good Friday members will ride to Richmond to join the Northern Motor Cyclists' Meet. On Easter Monday they will meet the Scarborough M.C.C. at dinner at the Brunswick Hotel, Bridlington.

Hertfordshire County A.C.

The programme of fixtures for 1908 is as follows:

April 25th.—Open motor cycle hill-climb.
May 2nd.—Meet at "Ashlyns," Berkhamsted, by invitation of R. A. Cooper, Esq.
,, 16th.—Members' fifty miles' consumption trial for cars and motor cycles.
,, 30th.—Meet at Hatfield Park, by permission of the Marquis of Salisbury.
June 13th.—Meet at Medmenham-on-Thames.
,, 20th.—Aston Hill-climb (cars).
July 4th.—Meet at Rose Cottage, Berkhamsted, by invitation of Ernest Webster, Esq.
,, 18th.—Annual gymkhana at The Grove, Watford, by permission of the president, the Earl of Clarendon.
Sept. 5th.—Members' hill-climb, Aston Hill.

Further particulars regarding the open hill-climb on April 25th will be announced in due course.

Cambridge University M.C.C.

The following is the calendar for next term:

April 25th.—Run to Peterborough for lunch.
May 2nd.—Saffron Walden for tea.
,, 9th.—Flexibility trials for twin and multi-cylinder motor bicycles for the Founder's Cup.*
,, 16th.—Hill-climb for the Moreing Cup and for the Hon. C. S. Rolls's Cup.
,, 23rd.—Reliability trials for the Rolls Cup.
,, 30th.—Cambridge *v.* Oxford (a team competition on Sharpenhoe Hill).
June 6th.—Run to Hunstanton and back.
,, 13th.—Run to Oxford and back.

*A silver cup presented by the founder of the club (Mr. J. P. Stokes) to be competed for yearly. The winner will be decided by the difference in time between a slow and a fast hill-climb on the same day and under the same conditions.

The Moreing Cup was presented by Mr. H. H. Moreing, More Park, Esher, for single and multi-cylinder motor cycles. The cup presented by the Hon. C. S. Rolls is for competition yearly, the winner to be decided by best performance in *(a)* hill-climb and *(b)* reliability trial.—*Communicated by J. P. Stokes (president).*

The Basingstoke and District M.C.

A paper entitled "Carburetters and Carburation" was read by Mr. W. Webber before the above club on Wednesday, March 25th. Mr. Webber commenced by explaining the duties of a carburetter, and with the aid of drawings and models described early types as well as some of the very latest. De Dion surface, Lanchester wick, and Longuemare spray were chosen as representatives of three different principles applied to carburation, whilst a sectional model of the latest Trier and Martin multiple jet carburetter proved of great interest to the audience. An interesting discussion followed. One member strongly advocated the wick type of carburetter, another variable jets, whilst considerable argument prevailed as to whether or not a weak mixture at high speeds was desirable. Votes of thanks to the lecturer and chairman (Mr. H. Williams) were carried unanimously, and the meeting closed.

Application for affiliation to the A.C.U. has been made, which body has agreed to affiliate motoring members only, considering the peculiar position of the club, which divides its membership equally between motoring and prospective motoring members.

On Saturday next, Mr. F. Baron will read a paper entitled "Some Sights in a London Motor Omnibus Garage," and on Saturday, April 11th, a special meeting to discuss the summer programme will be convened.

Some Items of Interest at the Olympia Industrial Vehicle Show.

OUR readers would naturally not expect to see motor cycle exhibits in an industrial vehicle show, but despite the enormous contrast between the weighty and cumbersome 'bus, the ponderous lorry, and the motor cycle, the latter little vehicle has a habit of getting there, so that half an hour or so spent in looking round the Gallery will reveal several accessories about which readers of *The Motor Cycle* will like to hear. Among the tyre section we notice the well-known firms of Dunlop, Peter Union, and the North British Rubber Co., while the Elastes Co., Ltd., show two motor cycle tyres—a Michelin and a Peter Union—filled with their patent material. If one of the wheels filled with Elastes is dropped on the ground, it rebounds with a resilience which is quite surprising. The Elastes Co. inform us that they are now filling a good many motor cycle rear tyres, and that those they have done are giving great satisfaction.

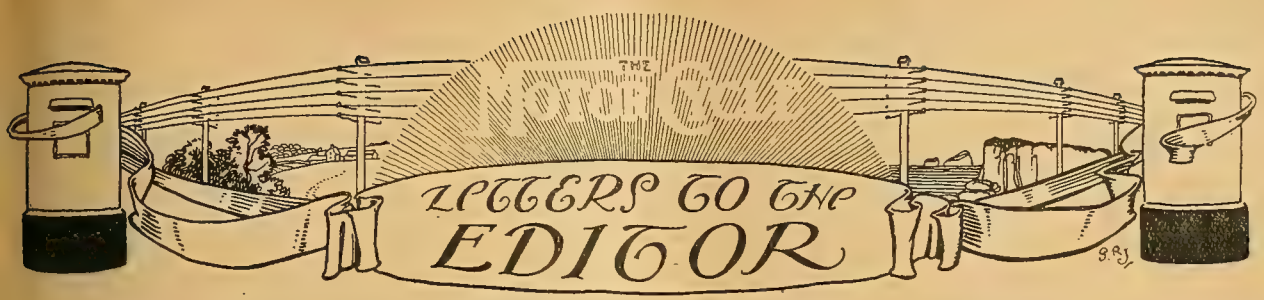
The method of working the Harvey Frost vulcaniser was fully dealt with in these pages some few months ago, so that most of our readers are well acquainted with this device, and it is interesting to note that the firm have introduced a new vulcaniser, the "Baby," working on the same principle as those which they have previously sold, but cheaper and considerably smaller, so that it will specially appeal to motor cyclists. The dimensions of the actual vulcaniser are 4½in. by 3½in., and those of the case which contains the complete outfit 6in. by 3½in. It is beautifully made, and should prove to be a valuable adidtion to the motor cyclist's kit.

Gamage's show of accessories is as unique as it is extensive. There is no need for us to dwell in detail upon the articles shown, as these have been so recently described. It is, however, worth noting that their tyre-stopping preparation, known as "Philkut," is commanding a ready sale, and is giving great satisfaction to motor cycle users.

The ignition firms are well represented. The Simms Motor Manufacturing Co. are showing their British-made Simms magnetos, now made entirely at their works. C. A. Vandervell and Co. show the new C.A.V. magnetos, accumulators, and coils. The Prested Battery Co. is also represented, and besides their usual batteries and induction coils, they will be showing later an interesting novelty, which we hope to describe next week. Pearson and Co. show motor cycle accumulators; while the Bosch Magneto Co. have a particularly interesting exhibit. The two Bosch models which specially appeal to motor cyclists are the D.A.I. for lightweight machines and the D.A.V. for V-type twin cylinders. In both of the above the fibre ring has ceased to form a working part of the contact breaker. Instead, the rocker is insulated by a small fibre block, which makes contact with two steel cams. In the D.A.V. the brass cover is provided with a clip, which forms an additional connection to the condenser besides the spring.

All the industrial vehicles and their appurtenances on show will be exhaustively dealt with by *Motor Traction* in the issue dated April 4th, which will be on sale at the Show to-day.

The Hirst magneto machine for cars and motor cycles has just made its appearance.



The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address

Outside Flywheels.

[3207.]—My humble opinion about "outside flywheels" is that if the makers would only arrange the timing gear so as to allow a good heavy flywheel on each end of the engine-shaft, *i.e.*, on each side of the crankcase, all motor cycle engines would be better balanced and give more power. Why has this never been attempted? A. J. ATKINGS.

The A.C.U. and Unattached Riders.

[3208.]—There must be a great number of motor cyclists who would like to have the privileges the A.C.U. grants to members of the affiliated clubs and who do not wish to join a local club, either owing to the ordinary subscription being too high, or to their not caring for the social and sporting side of the club.

If the A.C.U. would grant these privileges for an annual subscription of, say, 3s. 6d., I feel certain that many motor cyclists would join. J. H. S.

Subscription too low; should not be less than 5s.—ED.]

Motor Shows in Scotland.

[3209.]—Regarding the recent discussion on the courtesy of British manufacturers, may I be allowed to point out through your columns a "sore point" amongst us Scotch riders; I refer to the matter of shows. It seems rather hard that, while the Englishman has, as a rule, at least one show of motor cycles a year within easy distance of his home, we have absolutely none. I have been an enthusiastic rider for seven years, and take a keen interest in the progress of the sport, but have no time to run down South for shows, and therefore never get a chance of seeing a representative collection of machines together for comparison. Though a motor show is held annually in the Waverley Market here (Edinburgh), there was not a single motor cycle there, as far as I saw, this year. I trust to see this remedied. SCOTCHMAN.

The Future of Motor Cycling.

[3210.]—I am deeply interested in your effort to improve the breed of the lightweight, for I am convinced that were a thoroughly efficient lightweight evolved we should see a large increase in the army of motor cyclists.

I am one of the few Catholic priests in this country who are motor cyclists. I began with a 3 h.p. 1904 Ormonde, and my present mount is a 1907 Triumph. The latter is a splendid touring mount, but in making frequent calls within a short radius, and having to stop and start the machine very frequently, considerable energy is required, and fatigue produced. I could not for this reason recommend a machine weighing 150 lbs. to my *confrères*, most of whom use pedal cycles on their daily rounds in the country. What I require, and what would suit them also, would be an improved Moto-Rêve. (REV.) STEPHEN I. BROWN, C.C.

Co. Tyrone.

[3211.]—I notice that Mr. J. Van Hooydonk has been expressing his opinion very frequently of late in *The Motor Cycle* in regard to the relative merits of the light and heavyweight motor cycles, which possibly someone may take seriously. Personally, I have every respect for Mr. Hooydonk and his knowledge of motor cycling, and believe that he intends to do a lot of good hard work in its cause, but I do not think at the present moment that he is qualified to express an unbiassed opinion.

Mr. Hooydonk undoubtedly was an expert in motor cycling in the early days, but for the past three years I have failed to see him in any of our long-distance reliability trials on anything except a tricar or a light car, and if he has done any riding on an up-to-date high-powered motor cycle it must have been on some dark night when no one was there to see him.

The experience he mentions of riding a 2½ h.p. machine up Westerham Hill at twenty-five to thirty miles an hour, and yet when he tried to run it through the traffic in London the machine kicked and the wheels skidded every time he tried to start, is a ridiculous comparison to make, as anyone with a knowledge of motor cycles must know that a 2½ h.p. that was tuned to go up Westerham at over twenty-five miles an hour would hardly be expected to be suitable for riding in London traffic.

Personally, I would much prefer to ride the whole length of London, from Mile End to Hammersmith, in the middle of the day, on a high-powered single or 5 h.p. twin than a low-powered machine. It can be run at almost a walking pace when required, and in an instant, when the opportunity arises for one to go ahead, it will pick up to twenty miles an hour, and it is not necessary to keep getting on and off, as he mentions. I believe it would be more interesting to the motor cycling public to have the various opinions of practical everyday motor bicyclists than the opinion of one who is known as a driver of tricars or light cars.

Further, I can only say that I thoroughly believe that there is room for the lightweight as well as the heavyweight machine. The lightweight certainly encourages the beginner, and when he has thoroughly mastered it he is then ready to buy a high-powered, substantially-built machine which he knows will carry him from Land's End to John-o'-Groat's without fatigue or worry. W. H. WELLS.

Actual Weights.

[3212.]—Perhaps you will permit me to give a warning to future motor cycling recruits, viz., not to believe the makers' statement about the weight of their machines. When I bought my machine, I was told that it weighed "about 110 lbs." The real weight is more like 170 lbs. If intending purchasers were to add from 10 to 20 lbs. to the weights of machines in the "Buyers' Guide," I think they would arrive at a nearer estimate of the real weight. This does not apply to lightweights, as I have no knowledge of them. With regard to exchange transactions, I echo "Solicitor's" statement about Messrs. Wauchope. Besides being exceedingly courteous, they are very prompt, and pay immediate attention to one's order. They gave me what I asked for my old machine without any hesitation, and sent off my new mount immediately on the receipt of my cheque for the balance. I have no interest whatever in this firm or in any cycle concern, and only write this to let motorists know where to exchange their machines when they want "the square deal."

I am surprised that makers do not pay more attention to covering their machines with efficient mudguards. Even with a large extension piece, and a big flap on my front mudguard, my legs are caked in mud up to the knees, while the belt sends a fountain of liquid mud on my back and head. Could not some inventive reader design a guard that would prevent a rider turning into a mud-heap on a wet day? If so, I am sure he would make a small fortune selling it.

I am eagerly awaiting the arrival of Mr. English's gear.

ROAD SWEEPER.

The Motor Cyclists' Ideal.

[3213.]—Allow me to take this opportunity to congratulate you on your splendid paper. During the number of years I have bought your paper I have never read of you preaching the gospel of the heavyweight to the exclusion of everything else. You have been fair beyond reproach, and, in my opinion, you have always had the best interests of motor cyclists in view right away through. M. U. DUNCAN.

Magneto Covers and Short Circuiting.

[3214.]—Perhaps the following experience may interest some of your readers. My 1908 Triumph is fitted with a magneto cover, which I obtained personally from their London depot. I have suffered from intermittent misfires for some time, and have at last discovered that the high-tension circuit was shorted through the connection on the magneto machine touching the cover. I also know of a similar case, in which the magneto cover prevented the machine from starting at all. The remedy is simple: cut the cover so that the shorting is impossible. H. E. W. IREMONGER.

Two-speed Gears and Free Engine Clutches.

[3215.]—With regard to your advocacy of speed gears, on rare occasions when I have been stopped on a stiff hill I have humbly run down again and made another start. This little inconvenience has always appeared to me preferable to trouble with speed gear complications. H. P. B.

[3216.]—In answer to Mr. Fawcett's letter [3155] asking for experience of change-speed gears, I should like to say that I also think replies from users would be most instructive, and have been hoping to see a number of letters on the subject.

My own experience dates only from the summer of 1906, when I started to ride a 3½ h.p. Quadrant. Convinced from the first that some form of change-speed gear was highly desirable, I fitted a well-known form of expanding pulley. Although this was not completely satisfactory, it served amply to confirm my opinion. Discarding this pulley, I next fitted the N.S.U. two-speed gear, for which I have nothing but praise.

To my mind, those who think change-speed gears unnecessary must either confine themselves to well-made high roads or else encounter the certainty of exertion and risk that no wise rider would willingly undergo. At any rate, this is so in Devon, where hills are steep and roads narrow and winding; in the Midlands it may possibly be different.

In any case, a reliable change-speed gear enables one to go anywhere in any weather, and is therefore essential for general touring purposes. I may add that I have now used the gear for about 2,000 miles.

In conclusion, I ought to say that while awaiting delivery I used a plain pulley a good deal, including a run from Exeter to London, so am not entirely without experience of the other sort. I enclose my card, and remain a grateful reader. T 673.

1908 Specifications.

[3217.]—A very cursory review of your Buyers' Guide is sufficient to make clear a few interesting points. It shows up very clearly, for instance, those details in the specification of motor cycles on which all the chief makers are agreed, such as the superiority of belt transmission and magneto ignition, to mention only two. On the other hand, it also shows up none the less clearly, by the diverse opinions held by the various great firms, matters in which perfection is still very far from attainment. Perhaps in nothing else is this diversity more apparent than in the matter of length of wheelbase, where the figures given range roughly from 51½in. to 60in. But the question of the relative merits of short and long wheelbases is, in my opinion, a most important, though at present, I think, a rather neglected, one. It may be that, when the problem of variable gears is at length put on a fairly satisfactory footing, the present cumbersome method of trusting entirely to steel-studded tyres and similar contrivances as a preventive of skidding will be considered inadequate, and the whole matter be more thoroughly studied than is now the case.

As regards the abnormally long wheelbase, I am inclined to agree with its supporters when they assert that it diminishes vibration and gives ample room for various accessory mechanism. But are not these after all, especially since the introduction of spring forks, very subsidiary matters? The prevention of skidding in motor cycles seems, however, to be a matter of prime importance—one of those which must be considered and provided for in the whole construction of the machine. Now, when a cycle, either pedal or motor, is in the act of turning a corner, say on a greasy road, we have at the moment of turning a condition in which the fore wheel is directed by the rider, while the rear, being far removed from direct control, in following it has still a considerable tendency to continue in the original direction. Here we have the circumstances which give rise to side-slip. Now with a very long wheelbase it seems to me that this tendency must be much increased owing to the relatively longer distance the base of the rear wheel lies from the rider's control and in the case of a machine of such weight as a motor cycle owing to the momentum due to its weight, which must also be thrown into the scale at the instant of turning to swing as it were, the rear wheel in the direction of the original course. It results from the application of the law of centrifugal force: the fore wheel is for the moment the fixed point, and the rear wheel tends to be driven along the periphery in a circular motion about it. In the case of the short wheelbase, however, not only is the rear wheel, as were, more within the immediate sphere of control of the driver, but the distance from centre to periphery—in other words, the wheelbase—being so much less, the tendency to swing is also much less in evidence. On the whole, therefore, I consider the foregoing points serious drawbacks to the use of the abnormally long wheelbase, and shall be interested to learn the editorial opinion and also any remarks which the above may elicit from your readers.

DR. A. R. G.

[The editorial opinion is that length of wheelbase has very little to do with the question of side-slip. The tendency of a motor bicycle to skid sideways on greasy roads is governed more by distribution of weight, size of tyres, ratio of gear between engine and driven wheel, size of engine, number of working strokes to each revolution of engine, and force of explosion.—ED.]

Motor Taxation.

[3218.]—On picking up the *Birmingham Mail* of the 23rd March I noticed the Midland Chambers of Agriculture held a meeting on the 21st ult., when, along with other matters, motor taxation was discussed. It was considered that users of motors of all kinds, and particularly heavy and trail motors, should contribute something substantial towards the maintenance of the roads, and a resolution was passed, desiring to urge upon Mr. Asquith to allocate funds raised by his contemplated motor tax to the maintenance of the main roads.

Now is not this just what all motorists say about the matter, and do not motor cyclists already contribute too much to the national exchequer, and see nothing for it? What amuses me is that the heavy motor waggons and all commercial vehicles (motor) which are wearing away the roads and bringing in profit to the owners escape free. Does any one consider this fair?

I should like to suggest that in the event of legislation going against motor cyclists, the A.C.U., or some responsible body, start a petition in favour of motor cyclists (not heavy tricars and light cars), who cannot possibly do any appreciable damage to the roads, and send out forms for all motor cyclists to obtain signatures from responsible persons who would be in favour of same (the more non-motorists the better), and see if anything cannot be done, as this is supposed to be a free country.

Why not impose a small tax, say half a crown a year on push cyclists, and so considerably increase the revenue? I should not grumble at this, as I use a push cycle nearly all the year round, and consider I wear the roads as much this way as when motor cycling. I hope some agitation will be started before it is too late. O 2024

The Balancing of Petrol Engines.

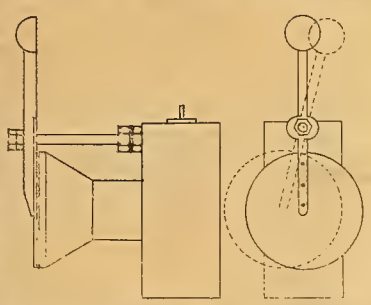
[3219.]—I have been much interested in the correspondence on the subject of balancing, which is being discussed in your columns. May I add my word to the discussion?

It is pretty well known that it is impossible in a single cylinder engine to balance perfectly the reciprocating weight by means of revolving weights, though if the engine were run at a constant speed a nearer approximation could

obtained. However, until the advent of the automatic infinitely variable gear, we must run our engines at varying speeds. The same remarks apply to the V-type of twin-cylinder engine—the increased smoothness of running being due, not to better balance, but to the increased number of power strokes. But there is at least one other type of motor cycle engine available—a type which seems to me an advance on all others on the market in the matter of balance. This is the twin engine with cylinders opposed and cranks at 180°, and I cannot understand why more designers do not place their second cylinder in a position where it will render balance weights unnecessary, and yet give a better balance as well as a more even distribution of power and idle strokes than the V type. I know that popular opinion is still against the horizontal cylinder and outside flywheel, but I think that most people who have had experience with these will agree with me that they are absolutely practical in use. The absurd accusations against the horizontal cylinder do not appear to be in evidence just now, but since the outside flywheel is at present a subject of discussion, I must say that I have never experienced any one of the three accidents which befell T. F. Cox, as related in his letter [3177]. My experiences have been obtained from the little Fairy, and for those who like light weight with medium power I do not think this machine can be beaten. R. M. S.

Air Shutters.

[3220.]—The illustration and description of the air shutter which appeared in a recent issue of *The Motor Cycle*, has been very useful to me, and I hasten to make my acknowledgments. I have a Raleighette tricar with Zafnir carburetter. To ensure a certain start it was necessary to exclude all air by holding one hand over the funnel of the main air inlet This was an awkward thing to do, and hampered one's movements when swinging the starting handle. A convenient hot air connection afforded support for a pivot on which to hang the shutter, and a counter weight now trips the shutter when released by the vibration of the engine, thus admitting air immediately the engine starts. It is a convenience I would not be without now I have realised its merits.



V. A. HOLROYD.

Variable Gears on Lightweights.

[3221.]—I have read letter No. 3169 in reference to variable speed gears on lightweights, also opinions on outside flywheels. In my opinion variable gears are not needed as they add to complication, and as the lightweight machine of the future is to be as simple and reliable as possible, it will be useless to fit variable gears.

I may say I designed one of the lightest twin opposed motors, weighing 12 lbs. complete with silencer and flywheel. This engine was taken up by Light Motors, Ltd., and called the Fairy. I fitted a metal to metal clutch and free-engine to this machine, but when it got on the market we found that there was no desire for it, for when adjustments were required it did not get them. There is no doubt if a clutch could be designed that would not require adjusting and would not wear it would be very nice.

The best substitute for variable gears on lightweights is to have a light twin engine of the opposed type such as the Douglas. With such an engine you get an impulse every revolution, and with the latest twin-cylinder magneto you get your machine started at a speed of four miles per hour. This is easily understood from the following: A single-cylinder engine with a gear of 6 to 1 only gets three impulses for one turn of the road wheels, whereas a twin engine, horizontal or vertical, and a 6 to 1 gear, gives six impulses for each turn of the road wheel; this makes starting very easy. It also tells on hills, as the engine picks up very quickly. I must say that I cannot speak too highly of the D.A.I.V. Bosch magneto for lightweight motor cycles.

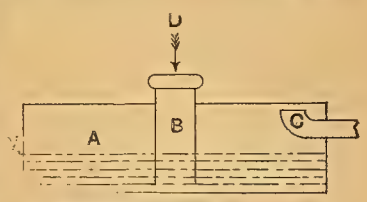
I should like to say a word or two about outside flywheels, as there has been so much talk about them. It appears to me that most of your readers overlook the fact that outside flywheels on single-cylinder engines of, say, 80 × 80 mm., run very near the ground. The flywheel of the Douglas is 10in. in diameter, and weighs about 14 lbs. It is fitted on the recognised standard taper of five degrees and a cast steel feather let into the crankshaft, which is hardened and ground true to gauge. This is the only way to ensure a perfect fit. A flywheel of this size and weight on a 2¾ h.p. makes it run very steadily. It is balanced by a special method, and is provided with an oil catching ring to prevent it throwing oil.

It would be a great convenience if makers would give the speed at which their engines develop full power. For instance, some single-cylinder engines of 1¼ h.p. are stated to have a cylinder capacity of 64 × 70 mm., whereas others with the same capacity are called 1¾ h.p. The Douglas twin-cylinder develops 2¾ h.p. at 1,600 revolutions per minute.

J. BARTER.

Exclusion of Dust.

[3222.]—In your leaderette referring to the above matter you quite overlook the simplest and most practical way of entirely excluding the dust from the air supply, viz., taking the air through water. I subjoin a rough sketch of a device which I found most successful, and one would scarcely believe the amount of mud that can be cleared from the tank after a few months' use. Result: Total exclusion of dust and resultant longer life of wearing parts of engine. This need only be small for motor cycles, as reduction of size only necessitates more frequent change of water.



A. Shallow water tank.
B. Pipe reaching almost to bottom
C. Air supply to carburettor.
D. Air and water supply to tank.
W. Water level.

ALFRED WRIGHT.

Consumption Trial Formulæ.

[3223.]—As one interested in all formulæ by which the relative merits or demerits of motor cycles may be demonstrated, either in hill-climbing propensities or as a test of economy in petrol consumption, permit me to say that I read with interest the report of the paper read by your contributor, Mr. H. H. Charge. After his criticism of another formula, I naturally expected that he had a grasp of the subject and realised the difficulties of drawing up a satisfactory formula based upon the relative weights of machines and riders or the sizes of the motors driving them, but on examining the nature and workings of the formula presented by him, I realised that my expectations were only to be doomed. The formula he advocated was weight of rider multiplied by size of engine (and it does not matter if the size be designated by either inches, millimetres, centimetres, or nominal horse-power based thereon—the relationship is the same); the product divided by weight or measure of petrol used—the resultant lowest figure giving figure of merit.

When I work it out I find that, all other things being equal, a 5 h.p. is allowed twice as much petrol as a 2¾ h.p.; and further, all other conditions equal, a ten-stone rider on the same sized machine would have to travel twice as far as a twenty-stone rider, or only use half the petrol, to have the same figure of merit. Which, as Euclid says, is absurd.

EXAMPLES.

Weight. H.P.	Weight. H.P.
$\frac{160 \times 5}{16} = 50$	$\frac{100 \times 5}{10} = 50$
Petrol.	Petrol
$\frac{160 \times 2\frac{1}{2}}{8} = 50$	$\frac{200 \times 5}{20} = 50$

H. WHEATER.

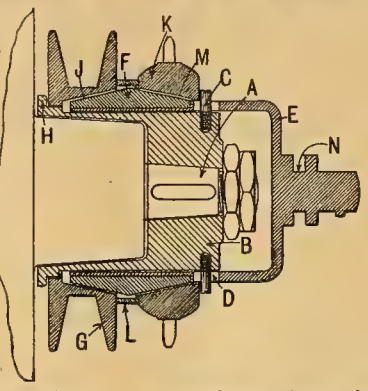
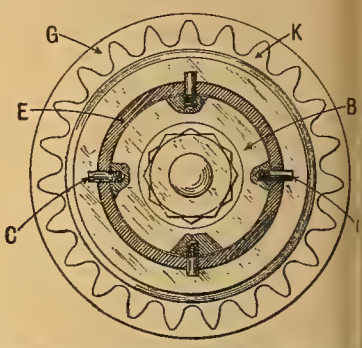
RECENT PATENTS. By ERIC W. WALFORD, F.C.I.P.A.

A Two-speed Gear and Clutch.

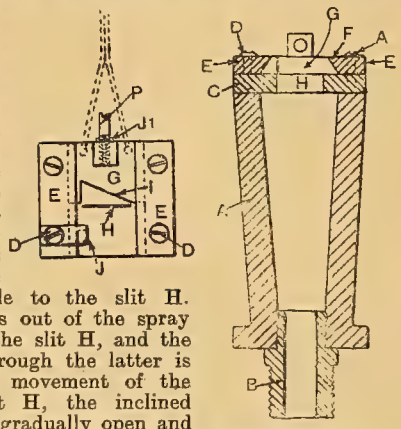
THIS is a simple construction adaptable to existing machines, and is the invention of Mr. J. H. Calvert, of Temperance Hall, Easton, S.O., Yorks. To the engine crankshaft A is fixed a sleeve B. From this sleeve project a number of radial pegs C. These pegs C pass through slots D in a sliding clutch sleeve E, which is mounted to slide on the first sleeve B. This clutch sleeve E has fixed to it a clutch member F comprising a double cone—that is to say, a cone which slopes in both directions. Free to rotate upon the first sleeve B is the belt pulley G, which has a suitable bearing on the sleeve and abuts against a flange H formed thereon. The interior periphery of the belt pulley is coned, as at J, to correspond with one face of the sliding clutch member F. Mounted upon the sliding sleeve E is a chain sprocket K, which bears up against the radial pegs C on the one side and a distance ring or separator L lying between it and the belt pulley on the other side. The interior periphery of the chain sprocket is coned, as at M, to correspond with the other face of the sliding clutch member F. In the belt pulley G lies a belt, which is carried round a belt pulley (not shown), fixed to the driving wheel or the like, whilst the chain sprocket similarly communicates with a chain sprocket on the back wheel, as through a countershaft It will be seen that when the clutch member F is in its midway position, the engine is allowed to run free in regard to the pulley or sprocket, or the latter may overrun the engine crankshaft. Thus a "free engine" is provided, and the machine allowed to coast without the engine running. Moving the sliding clutch sleeve in one direction locks the belt pulley to the fixed sleeve, and thus to the engine crankshaft. It is preferable that this provide the high gear, so as to take advantage of the relatively high belt speed. To obtain the low gear the sliding clutch sleeve is moved in the opposite direction to release the belt pulley and lock the chain sprocket to the sleeve B fixed to the crankshaft. Any suitable means may be employed for sliding the clutch sleeve, by a fork in the groove N, operated in a convenient manner.

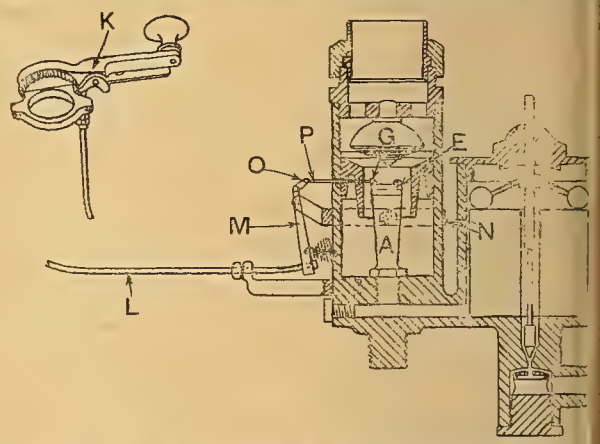




A Variable Jet.

THIS is the invention of Mr. H. Holland, of Milton Avenue, Highgate, N., whose object is to provide a jet having a variable orifice, which may readily be fitted to existing carburetters. At its narrower end the jet A is internally threaded to receive a threaded adapter B, whereby the jet may be adapted to different carburetting apparatus. Connected to the wider end of the jet A is a flat plate C, having secured thereon as by screws D two guides E forming a dovetailed groove F for a slide G. Through the plate C is formed a slit H, and the slide G has one of its edges I cut so as to be disposed at an angle to the slit H. The petrol must pass out of the spray tube A by way of the slit H, and the flow of the fluid through the latter is readily variable by movement of the slide across the slit H, the inclined edge I operating to gradually open and close the slit. Movement of the slide in either direction is limited by stops such as J J^1, and to effect such movement any means may be adopted which will allow fine adjustment of the slide to be effected. The arrangement shown consists of a pawl and ratchet controlled lever K for operating

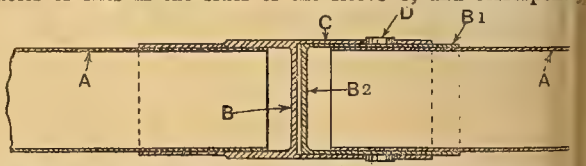




Bowden wire L connected to a spring controlled lever pivoted intermediate its ends to a clip N fastened round spray chamber. The lever M is connected by a link O to connection P attached to the slide G.

A Detachable Air Tube.

THIS is the invention of Mr. A. E. Green, of the well-known firm of F. Reddaway and Co., Ltd. The air tube A is of the desired diameter and of length to fit snugly around the wheel rim, each end of the tube being sealed to make it impervious to air pressure. A valve is provided for inflating the tube, and the tube is capable of retaining the air pressure by means of its sealed ends. One of the ends of the tube is sealed with an extending sleeve C, having the disc B formed about midway therein. The other end of the tube is sealed by means of a sleeve B' terminating in a disc B^2. This end is disposed within the projecting sleeve or socket C, so as to form temporarily an endless ring of the requisite diameter. Means may be provided to temporarily lock the inserted sealed end B' of the tube within the sleeve C. This could be effected by providing holes or slits in the sides of the sleeve C, and corresponding projections D on the sides of the sleeve B' of the air tube inserted in the sleeve C, so that the projections would pass through the holes and tend to prevent displacement of the inserted end of the tube.



TRICARS FOR SALE.

3 h.p. Humber Tricar, chain driven, a handy little runabout; £15.—Wauchope's, 9, Shoe Lane, London.

HOBART Tricar (4½ h.p.), good order; £25, or exchange.—Templeton, 535, Sauchiehall Street, Glasgow.

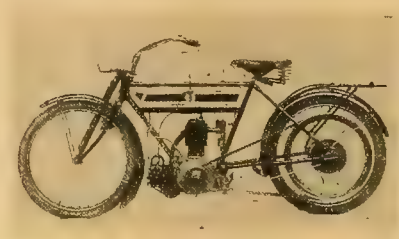
AN IMPROVEMENT ON PERFECTION!

The "Triumph" is a perfect specimen of British design and workmanship. Of that there is no doubt whatever. **BUT** the addition of **THE PREMIER TWO-SPEED GEAR** with ROC (Licensed) **INTERNAL EXPANDING CLUTCH** improves it immensely. Here is the photo of one which we lately fitted:



It improves ALL machines with regard to the following important prints:—

HILL-CLIMBING, CONTROL IN TRAFFIC and on GREASY ROADS, MOUNTING (it starts anywhere like a car), PASSENGER WORK, COMFORT (it eliminates pedals and pedal gear, for which footrests are substituted).

It can be fitted to **ANY** machine, no matter what power, new or second-hand.

We are sole manufacturers of the **WARWICK** motor bicycle in which the Clutch and Gear are incorporated in an ideal manner.

Please let us give you all particulars.

FRAME, light, low, for small vertical engine; cash, or exchange small lathe, compound rest.—Kerridge, Market Street, Alton, Hants.

WANTED, carburetter, to fit twin Antoine engine and double make and break contact, any pattern.—W. Hyne, 41, Church Street, Camberwell, S.E.

TWIN (Rex preferred), for 3½ h.p. Minerva, winner of several hill and speed competitions, perfect order; offers. —Middleton, 41, Osborne Road, Pontypool.

MABON Free Engine Pulley and clutch, for Minerva; also motor cycle toolbag, with complete set of tools and acetylene headlight; approval.—E. Ramsay, Whitehill, Rosewell, N.B.

WANTED, 1908 or 1907 Triumph motor cycle, new, or equal to, in exchange for 1905 Rex and cash; also lowest price for no exchange. — No. 9,538, *The Motor Cycle* Offices, Coventry.

CYCLE Agents should read "The Cycle and Motor Trades' Review," the leading trade organ; specimen copy will be sent on receipt of trade card. — Address, "The Cycle and Motor Trades' Review" Offices, Coventry.

WANTED, 3½-4 h.p. low-built motor cycle, good make; exchange De Dion 2½ h.p. motor cycle, good order, and 3 h.p. Quadrant motor cycle, minus front wheel, good tyres.—Particulars, T. Clarke, Kessingland, Lowestoft.

MISCELLANEOUS.

THE Best Silencer Made is Aldington's patent Silent, from 10s. 6d.—Below.

THE Ball Bearing Ideal Fan will cool any engine; 28s. 6d.—Below.

MY Footrests, reduced to 6s. 6d., are a luxury, spring rests, 17s. 6d.—Aldington, 59, Haydon's Park Road, Wimbledon.

DYNAMO, 60 volt, as new, no toy, weight 70 lbs.; £10.—Wellesley Works, Rake, Hants.

WHIPCORD Breeches, latest cut; 10s. 6d. — J. C. Savage, 119, Donegall Street, Belfast.

PULLMAN'S 26 by 2 Non-skid Cover, with tube, as new; 12s. 6d.—207, Peckham Rye.

UPHOLSTERED Cane Body, spring seat, suitable forecar or trailer; £1. — Hilton's, Slough.

2¾ h.p. 1905 Water-cooled De Dion Engine, wipe, two-speed gear, perfect; £8.—Below.

2 h.p. Quadrant Engine, in new condition, spray; 50s.—80, Bispham Road, Southport.

SHEDS for Motor Cycles, 45s.; portable.—Stevens, 82a, Leighton Road, Kentish Town, London.

The Variable Pulley

INVENTED BY

Mr. THOS. J. WALKER-CAIRNS.

K 873

and described in "*The Motor Cycle*," Oct. 30th, 1907, and March 18th, 1908, is now being placed on the market.

The locking arrangements shown, although good, were not simple enough, and are already obsolete. A much simpler and stronger method of locking is now being used. The pulley has been under trial for over two years and is now a thoroughly reliable and efficient piece of mechanism. There are fourteen positive speeds ranging from 6 to 1 up to 2¾ to 1, and two sizes.

No. 1 for lightweights (up to 2½ h.p.) **45/-**

No. 2 for heavyweights (up to 5 h.p.) ... ... **55 -**

These are operated either from the handle-bar or by pedal. It is advisable for prospective buyers to order early as the works output at present is somewhat limited.

The Motor Cyclists' Ideal.

AS promised in this column last week, we now have pleasure in giving a few rough particulars we have been able to collect while checking and tabulating the replies to the first three queries on the form issued with *The Motor Cycle* of March 18th.

One of the most interesting points in connection with the replies is the very large number of readers who are in favour of a twin-cylinder motor bicycle. Of course, the predominating desire is for a single-cylinder engine; nevertheless the twin-cylinder figures came as somewhat of a surprise to us, not that we look upon the twin-cylinder with the slightest disfavour, but we certainly did not realise that twin-cylinder machines were so much desired. It is also surprising what a large number of twin-cylinder enthusiasts desire a powerful, and consequently a heavy, machine in comparison with those who favour the lightweight. Those in favour of a single-cylinder engine of comparatively large dimensions are enormously in excess of those requiring a machine fitted with any other engine, either multi or single-cylinder, but doubtless the demand for engines of smaller capacity will increase during the year, particularly when it is further shown by constant public performance that such machines are capable of satisfying the exacting requirements of prospective purchasers.

Our constant advocacy of change speed gears for motor cycles, both editorially and through contributors, has been fully confirmed. Without publishing figures, which we intend to hold back until the whole of the replies to the questions have been carefully gone through, we may say that we have divided motor bicycles into seven separate headings, which embrace the whole of the various machines on the market without sub-dividing them so minutely that the figures would be practically useless. Sub-divide under these seven headings, we find that no matter whether the motor bicycle desired is to be fitted with a single-cylinder engine of extremely small dimensions or with a multi-cylinder engine of large dimensions, the answers in all cases prove that the majority are in favour of a change speed gear. We make no secret of the fact that many of the replies show that there is a considerable amount of doubt in the minds of readers whether there is a perfect change speed gear on the market. Still, the fact remains that the majority will have one, almost irrespective of cost, when a gear has proved itself absolutely reliable and efficient. This information will, no doubt, be of service to those makers who are not fitting a two-speed gear, and cause those who are either making or fitting a two-speed gear to increase their efforts to improve existing patterns, also to exploit what is undoubtedly required but difficult to obtain.

In our next issue we hope to be able to give some further interesting rough notes from the statistics we are compiling, and we trust our readers' patience will not be tried too sorely if we ask them to wait a few weeks for the tabulated list of percentages upon which our staff is at work, and which we referred to last week as being a task which could not be handed over to an ordinary clerical staff to tabulate. These percentages will be found to be one of the most interesting features ever published in *The Motor Cycle*.

A Few Days in the Pyrenees.

By G. J. C.

THE General Steam Navigation Company's boat, the *Grive*, was advertised to sail from London to Bordeaux on the 17th August, 1907, at 3.30 p.m. As the clocks struck the half-hour a quiet voice somewhere overhead said, "Let go forrard." Simultaneously a cry went up, "Man overboard," and we were delayed some minutes while a belated stoker was fished out of the water.

On the second day out the saloon was somewhat empty at meals, but on the whole the trip was smooth and pleasant, and this way South is to be recommended.

A talk with "Chips" resulted in a piece of wood being securely fastened to the handles to carry my faithful Sanderson camera, and a larger one on the luggage carrier took a heavy bag comfortably.

Although I was a tricarist, I made this tour on a brand new Rip spring frame 3½ h.p. pedalless motor bicycle fitted with a two-speed gear, which had hardly been on the road, and was not fully tuned up. I might at once say that I had no trouble either with the engine or tyres. The only involuntary stop was caused by a broken luggage carrier, although a gummed up exhaust valve caused some few minutes' delay in starting on one occasion.

A few words with regard to my outfit may be of interest. A full set of tools, repair outfit, and spare inner tube were carried. With the camera I used Houghton's new plate and film envelopes, which were a great success. For personal use a rainproof coat, a dust coat, spare linen, sleeping and washing gear, *and* a pair of trousers. The latter are invaluable, as, apart from appearance, their comfort after a long ride in breeches and leggings is very great.

I trained from Bordeaux on the morning of the 20th to Biarritz, and the first ride was undertaken from there. After filling up with petrol, which I had no difficulty in obtaining, the motor started up at once, and I ran quietly out of Biarritz on the high road to Spain. About a mile out I narrowly missed a car through a momentary forgetfulness of the French rule of the road, and for a few miles drove easily while accustoming myself to the new mount. After a time the healthy sound of the engine and the fine road were too enticing. In a few minutes (so it seemed) St. Jean de Luz, a pretty little place by the sea, was reached. After taking a snap shot I rode for the frontier, intending to go on to St. Sebastian. The Spanish Customs I found to be very troublesome, and finally the motor

Gateway into Fuentarrabia. Two thoroughfares in Fuentarrabia (Spain).

A Few Days in the Pyrenees.—

bicycle was left at the French frontier, and the train taken to Irun, where I lunched and missed the connection. The waiter promised to warn me when the

A view in Lourdes.

train would leave, but—"to-morrow" is Spain's motto. The mischance turned out fortunately, as it led to my walking from Irun to Fuentarrabia—a place well worth visiting. This is said to be the most Spanish of all Spain's northern towns. Those interested in history will remember it as the scene of Wellington's triumph over Soult.

Heading for the Pyrenees.

After spending a few days at Biarritz with friends, the real tour began in a run over the fine direct road from Bayonne to Pau, some sixty miles. Bayonne itself is well worth seeing, some of the small streets having arcades similar to those at Chester. A curious window and rather florid cloisters form the interest of the Cathedral. Pau, with its terrace and big hotels, is conventional, and I was not sorry to leave. Following the Bagnères-de-Bigorre Road for some miles, a fork to the right leads to Lourdes. Chickens swarm all over the roads in the villages, and I rather fancy someone had roast fowl cheap that day.

At Lourdes one is struck by the immense sums expended by the devout, who seem mainly of the poorer classes. The scene at the grotto while services are going on is impressive and very pathetic. The contrast between the pilgrims and the mere tourists is very noticeable, and the numbers attracted by their aspirations or mere curiosity are enormous.

At Lourdes the tanks of the machine were replenished. Here, and indeed everywhere I went, air-cooled oil was unobtainable, so the tank was filled up with the water-cooled variety, an extra litre tin secured to the footrests, and a start made. The road towards Pierrefitte is nearly level, and, the engine humming away merrily, many miles soon separated me from the town. The valley is broad, but as one goes further the mountains close in, and the views in the evening light are very fine. The Hotel de la Poste at Pierrefitte, where I put up for two nights, is comfortable, clean, and inexpensive. The morning after my arrival the first real climb (to Arrens) was undertaken. The surface of the hill is good, but the road ascends in zigzags for some three miles, and, although the gradient is not excessive, I found it necessary to use the first speed most of the way up. A top speed of 3¾ to 1 is much too high for hilly country, and the low gear of about 8 to 1 was throughout the tour used much more than would be necessary with a more reasonable top speed.

A Two-speed Gear Most Useful.

However, there are in this compensating advantages, as it is very pleasant to ascend these long, winding hills at a slow but sure pace, and be able, without bothering about the engine, to fully enjoy the wonderful views which unfold themselves at every turn. On the level, open tracts one attains a speed which soon leaves uninteresting country behind. Moreover, in climbing long ascents in this country one is often tempted to dismount to admire the exquisite scenery, and frequently a dismount is made at places where with a single gear it would be impossible to restart. Being of a lazy disposition, I found it much less trouble to run the machine downhill for a few yards, declutch, turn it round, and after mounting in comfort glide off up the steepest slopes on the low gear, the alternative being a very hard push uphill until the engine gave its cheering cough.

(To be continued.)

A PASSENGER ATTACHMENT.

THE passenger attachment seen in the accompanying illustration is one made and used by Mr. William Milligan, Eglantine Villa, Stowmarket. The attachment is light and rigid, and the whole weight of the passenger is carried by the rear portion of the machine. To all intents and purposes it is a lady's bicycle minus the front wheel; consequently when a really severe hill is encountered, or even when starting, the passenger can assist with the pedals if necessary. One advantage of this form of attachment is that, owing to its light weight, it needs very little power to propel it, the motor bicycle in the illustration being a Clément of only 2 h.p. Mr. Milligan will be pleased to hear from anyone interested.

OCCASIONAL COMMENTS.

By "IXION."

The R.O.M. Contact Breaker.

From one or two letters I have received, it is clear some of my readers do not understand the principle of this device. It possesses two blades, A and B, of which B is a rocking blade, having a platinum stud at each end, making and breaking contact with a corresponding screw. This is nothing more nor less than a "switch blade." Blade A is an ordinary single make and break, with one stud, and one screw to match. These blades are worked by an eccentric and a double cam. The eccentric and the double switch blade shift the current from the real make and break to each cylinder in turn. Thus the firing in the cylinders is determined and actuated by one pair of platinum screws, and no matter how this pair of points are adjusted, worn, soiled, or pitted, the firing remains "synchronised." [See "Recent Patents," p. 286.—ED.]

Mr. Hooydonk and the Lightweights.

Mr. Hooydonk in his reply to me rather ignores my statements, and contents himself with pointing out that I have always turned the limelight on the heavyweight. To continue his metaphor, when the stage is crowded the man in the wings naturally turns his limelight on the stars. Now I am the man in the wings; it is not my business to show up the slovenly dancing, the tinsel jewels, and the fustian tights of the supers, but to project limelight on the star performers. I leave the poor supers alone as much as I honestly can; they may be stars when their stagecraft is a bit better. I have tested and ridden the low powered and lightweight machines as honestly as the heavy and high-powered, but I have always found the heavier weights were the real stars until the last eighteen months or so, when I began to see the supers were coming on a little, and since them I've turned a little more limelight on the supers. I daresay in the next act the star may be a bit *passée*, and a super may take the middle of the stage and sing a duet with her. If so, they shall equally share the limelight, and that is a promise, Mr. Hooydonk.

Handle-bar Mirrors.

Now that mirrors affording the driver a bird's-eye view of the road to his rear are becoming almost universal upon cars, perhaps motor cyclists will take to them a little more enthusiastically. It is my habit to take the pick of the road when I fancy I am alone, and once or twice I have been very nearly swept down by a car from behind when I have suddenly swerved to my wrong side in search of better going, my last escape being from an 80 h.p. Napier, handled by no less a person than S. F. Edge himself—though that fact would have been small consolation to Mrs. Ixion. Another emergency when these mirrors are very useful is when riding in company, and more especially reckless company. On a club run there is usually present at least one specimen of that breed of juggins who suddenly pops up level on your near side with about three inches to spare and enquires blandly if your throttle is fully open, because his isn't —"nowhere near it." Yet a third blessing the mirror may confer—and has actually conferred upon a fellow clubman of mine—is as follows: What time he was coaxing a level—well, one digit, with one cypher affixed —out of his new T.T. twin, the tell-tale disc revealed a burly constable emerging from the hedge to the rear and waving a handkerchief. Here the mirror proved literally worth its weight in silver, if not in gold.

Gudgeon Screws Adrift.

Another rider informs me he has experienced an accident similar to that I described, his set screw falling out of its place, and emerging into space through the cylinder walls at a point near the bottom of the piston's travel. He also is still using the same cylinder. He first clamped a band of plain brass to cover the orifice, but, finding his lubricant escaped he put a double band of asbestos cord covered with manganesite packing beneath the band of brass.

Belt v. Chain.

Mr. Vinsen tells us he intends riding a belt-driven J.A.P. with sidecar through the London to Edinburgh run. Consciously or unconsciously he has chosen the easiest 400 miles of road in the United Kingdom, and the relative superiority of belt and chain for sidecar work will remain to unconvinced riders as open a question as ever. If Mr. Vinsen would try to put the same outfit through the End-to-end, the anti-chain brigade would probably have something to chew the cud over. Mr. Vinsen should get to Edinburgh, with luck, on his top gear alone, as the big Napier did some years ago. But he will not get to John-o'-Groat's, with the same outfit, without using up a spare belt or two and most probably not without dropping his passenger.

Power for Sidecars.

The curious ideas of some riders upon the power for sidecar question are due to very limited riding experience. For instance, an owner recently described in our columns how 3½ h.p. would take his sidecar up Ridge Hill and Barnet Hill. These gentle slopes are flat compared to the gradients to be met with in many parts of England, and in any prolonged tour, and a machine which cannot take them with an enormous margin of spare power is practically useless for sidecar work. Riders often write to me on this question, and not seldom refuse to take my advice; if so, they invariably regret it. I had an almost tearful letter from the heart of Central Africa this week; the gentleman in question had a thoroughly good 6 h.p. twin, single geared, and was helpless with it. Nearer home, a man consulted me last year, and defying my counsel, fitted a sidecar to a 3 h.p. two-speeded chain driven. He lives in a northern county, and all the year he might be seen toiling on his low gear whenever the wind was blowing or the roads were heavy; often he failed to climb hills, even with the sidecar empty. This year he has substituted a 5 h.p. twin, also two-speeded and chain-driven; his low gear ratio is higher than I advised, and though a good driver and amateur mechanic he still knows what it is to fail on a hill with the chair empty. For a sidecar that is to be used for genuine touring work the following are essential requisites:

1. Minimum power, 5 h.p. 2. Chain transmission. 3. Two speeds. 4. A low second ratio (*e.g.*, 8½ to 1). I am well aware many riders will remain incredulous, but my words will be proved when the trade has had time to evolve an efficient motor bicycle specially designed for sidecar work.

OVERHEATING.

By R. W. AYTON.

OES an air-cooled engine overheat?

Considering the number of times during the past decade that this question has appeared in the automobile press, with the invariable result strong affirmative reply, it appears singular that ould yet again be propounded. Seeing that the omenon in question is painfully familiar to most s who can claim anything like an extended and d experience with air-cooled engines, the fact that xistence is seriously questioned borders on the ellous.

ut when we reflect that, from the technical point of , the peculiar effects experienced when "overheat- ' occurs are precisely what might be reasonably cted, and admit of a perfectly clear and reasonable anation by simple reference to well-known facts, it mes obvious that, in order to justify its recurrence, question should be prefixed by the short but ficant word that has been responsible for all true ress in thought and knowledge since man first n to think:

IY does an Air-cooled Engine Overheat?

rst of all let us determine by careful observation what happens when a motor cycle engine "over- ." In order to do this I invite the reader to npany me on an overheating expedition, say round .T. course, with a 1907 3½ h.p.

have done a couple of circuits at an average . only limited by due regard to fuel economy; quently things below deck have become pretty . A glance at the petrol gauge shows that we are within the consumption limit, so we resolve to give nachine its head and an opportunity to show it *can* do. Cautiously we adjust and readjust le, air, and spark until there is no longer any that we are getting maximum speed. Through r but twisty Glen Helen we tear at well over

All goes well until we reach the gradually asing gradient which forms the approach to ed Creg Willey's Hill. Here we notice that, ite of careful and systematic lubrication, the e slows down more than on previous trips. A turn to the left—the front wheel tips upwards— ve are really climbing. Horror! the engine is ually slowing down; the slight "knock" which d us to retard spark has increased to something en a "clank" and a "thump." Desperate, we to "L.P.A.," but in vain. The bark of the ist, which has been decreasing in sharpness, is nly dumb. A silent revolution or two, and the e pulls up dead with a jerk that almost saves us ouble of a hurried dismount. We are "stopped gh overheating."

An Interested Spectator.

a curious coincidence Mr. Nevill is on the hill. ving the occurrence, he approaches, condoles, explains:

"This is caused by a slight leakage past the ings. This leakage will have little effect at high peeds, but when the machine commences to ascend a hill the leak comes into action, the speed of the engine falls gradually yet surely, consequently the cooling effect gets less and less, and the machine finally stops with the engine *excessively* hot. Therefore the leak is responsible for the engine's overheated condition, and the cause of stoppage is a combination of loss through the leak, premature expansion of the incoming charge, and exhaust retention." (Page 177.)

More in sorrow than in anger we drop the stand, and, mindful of our newly fitted piston and polished rings, and of valves carefully ground in a few hours ago, invite him to try the compression. As we do not wish him any harm, we make sure that switch is off and air valve full open. He stands on the pedal; after a short interval admits that compression is unexpectedly good. He mounts and pedals vigorously, incautiously moving the air lever. Result as he drops exhaust valve is either a dead stop or a vicious back-fire, lifting him from the saddle and, *viâ* the pedal, providing his shin with a large and promising bruise. Undaunted, like a good sportsman, he offers to "give us a push-off." We gratefully accept, as we do not wish to return to the foot of the hill.

Now a strange thing happens. No matter whether the current is "on" or "off," regardless of any degree of belt-tightness, our combined efforts prove unequal to forcing the engine over compression! Whether we pedal whilst he pushes, or whether both run, the dropping of the exhaust valve is invariably the signal for either a dead stop or a fatiguing "drag" of belt over engine pulley. The engine, supposed to have been stopped through partial decompression, has suddenly developed a hyper-compression that defies our utmost efforts. By now we also are "excessively hot." We are reminded of the "arrmy mewel" of the Yankee humorists; also of Hooydonk's traffic experiences, and other things. As Mr. Nevill gamely assists us to push the machine to the top of the hill we call his attention to the fact that the exhaust valve is still in full working order, and invite him to explain how this fact fits in with his allegation of "exhaust retention." We are dimly conscious of a vague idea that loss of compression, whether past the piston or at any other point, would leave less exhaust to be disposed of, and that the slower the engine ran the longer would be the period during which the valve would be open for the escape of the burnt gases. He promises full particulars in a later edition. Warm and wondering, we resume our journey.

What it feels like to Ride in the T.T.

A smart switchback run until, just past St. John's Chapel, we find before us a glorious speed stretch—a broad straight road, gently falling for the greater part of a mile. Here is a chance to recover some of those lost minutes! Full advance, half throttle, full air; down we thunder at well over fifty miles an hour, the wind screaming past our ears as, crouching low, wrists taut, knees well in, and feet tight down, we strain our eyes to make sure that the sharp turn at the bottom is clear. Glorious! Life is worth living! A sharp, steady swing of leaping machine and tense rider—one living unit—and we are round, just clear of the child-crowned bank, and heading for Kirk Michael. Only a slight up-gradient, but the pace is perceptibly slower. A further opening of the throttle meets with an instant

Overheating.—

response; but the improvement is not maintained, the engine vibration becomes more irregular, and the sound of the exhaust seems to be losing its crisp sharpness. A tentative switch-off has the expected negative result —current quite superfluous. We nearly close the throttle, but, too late! it hardly delays the dreaded moment when the first backfire sends the belt squealing over the suddenly stationary engine pulley. Hastily we tweak open the exhaust valve, for in the lifter lies our only chance to keep going, even at a jog trot. Again are we obviously suffering, not from defective compression, but from a plentiful excess thereof.

Later on, after a smart run homewards, we switch off and lift exhaust valve before turning into, say, the gateway of the yard or garage. If now, at a materially reduced pace, we release the valve lifter, what happens? The engine at once starts firing, slowly, but regularly, although current is "off." Let the machine run round the yard and "have it out," regardless of the suffering belt fastener. We find that it slows down, and finally comes to a standstill with a violent backfire that throws us out of the saddle. But no sign of weak compression.

There is no need to further multiply instances. Clearly the empirical has again triumphed over the *a priori*.

Now incidents of the description above referred to have quite frequently occurred under my observation during the past eleven years. Varying only in intensity, their recurrence has presented substantially the same symptoms in quite a large number of engines of very varied types. On cars, a broken water joint (not an infrequent occurrence in the early days) has always heralded its unwelcome existence by the appearance of similar phenomena.

In the case of a small gas engine (4in. bore × 7in. stroke) which had an uncooled header, a slight overload tending to reduce its speed, invariably caused rapid slowing-down, muffling of exhaust noise, and final stoppage through backfire, with reversal of motion thereby. Whenever, within my knowledge, an air-cooled engine has been overdriven, whether in height of summer or in depth of winter, Nemesis has always assumed substantially the same forms; and that such retribution has been more tardy in some cases than others has always been traceable to one, or a combination of two, simple factors. These are:

(*a*.) Ratio of Compression Space to Cylinder Volume, and

(*b*.) Number of Revolutions per Minute.

The operation of factor (*a*) is well-known and widely recognised. It may be briefly stated as follows:

Given two similar engines working under equal conditions, but varying only as regards compression ratio, the engine with the higher compression will invariably be the first to exhibit the symptoms previously described should they occur.

It should be borne in mind that, in addition to its functions as a fuel economising device, the throttle exercises an effect equivalent to that of a variable compression space. This explains two facts that have probably been observed by most motor cyclists, viz.:

(1.) In order to use a high compression engine without overheating, it must be driven with the minimum throttle opening permissible under any given conditions.

(2.) Such an engine, so driven, will generally run satisfactorily under ordinary conditions, but w probably fail on the first long hill having a gradie necessitating serious increase in the gas supply.

This brings us to the even more important factor (i

The Critical Speed of an Engine.

Every engine has a critical speed for a given deg of compression, the determining factor being t efficiency of the cooling arrangements. Above t speed, the period during which the charge is bei forced into intimate contact with the heated walls (*e.*, duration of compression stroke) is insufficient for t absorption of sufficient heat therefrom, plus the h of compression, to render the charge self-igniti Consequently ignition is effected by, and depend upon, the passage of the spark. Under these conditi it is obvious that any reduction of engine speed will followed by automatic pre-ignition having a slight le upon (*i.e.*, occurring slightly in advance of) the pass of the spark. Switching off the current will at t stage produce practically no effect upon the firing the engine. The additional back pressure or negat work thus thrown upon the piston will tend to furt reduce engine speed, causing a reduction in the w drawing effect of the throttle. The results the become cumulative. The degree of compression a matically increases as the compression period lengthe consequently the moment of automatic pre-igni occurs earlier in each compression stroke. Ignition combustion are now complete before the exhaust v opens; hence the altered character of the exh noise. Meanwhile the cylinder walls are absorbing unduly large proportion of the heat evolved, owing the ignition taking place early in the compres stroke. Finally, the engine is brought to a stand by the excessive back pressure, sometimes so sudd that the pressure of the finally ignited charge has t released by lifting the exhaust valve before the en can be turned over. The cylinder walls are now so that restarting is impossible, the first charge firing e in compression stroke, and resisting the efforts of belt with a back pressure on the piston of anything to 300 lbs. per square inch. When the cyli temperature shall have fallen below the degree requ to produce pre-ignition—and not until then—shall be again in possession of a "prime mover."

Overheating and Pre-ignition one and the sa

It will thus be seen that leaky pistons, co-effici of expansion, and transformations of energy have re "nothing to do with the case." Overheating generally understood by the motor cyclist, is synonyn with pre-ignition. Remove the causes of the latter, the effects attributed to the former disappear.

The reason why this explanation has not accorded its proper value in previous discussions the subject is simply that the debaters have faile recognise the influence of the all-important time fa This is, to a large extent, also the reason for inadequacy of illustrations drawn from standard engine practice.

Let us now apply this time factor, as a sort of to stone, to what is probably the most ancient fallac all, yet once more revived by Mr. Nevill, and, even less excuse, by Mr. Burnand—the "abno expansion of the charge" due to "heating of the ch during admission."

We will first consider the conditions. A qua of gas is being drawn, at a high velocity, throu

verheating.—

ort which, in a well-designed modern engine, consists f a very short rectangular aperture of relatively large rea. The time occupied by the passage of the entire harge, *i.e.*, from opening to closing of induction valve, at ordinary speeds approximately 1-40s.; at racing peeds 1-80s., or even less! This gas consists mainly f atmospheric air charged with finely divided petrol n the act of undergoing evaporation (*e.g.*, heat absorption), and is also, as Mr. Burnand points out, "wire-rawn," or in a state of forcible attenuation. Its mperature at entry must, therefore, by the very law ferred to by Mr. Nevill, be considerably below that f the atmosphere.

Why the Carburetter is Heated.

Having regard to these conditions, I submit that it not reasonable to assume that a gas is capable of ceiving, in such a minute space of time, any serious crement of heat from the surrounding metal during s passage into the cylinder. The manograph indicator me years ago established the fact that, in motor cycle gines having valves of quite moderate dimensions, haust retention was practically non-existent even at e highest speeds. This leaves the rapidly cooling ntents of the clearance space, at about atmospheric ressure, the only credible source of gas heating prior commencement of compression. That the heat-sorption from this source is not undesirably excessive evinced by the well-known necessity of pre-heating e air supply to the carburetter under unfavourable mospheric conditions. Were the heat transfer in the linder at all considerable, this should be more than fficient to complete vaporisation of the fuel without y recourse to external aids. Many facts go to prove at, so far as motor cycle and automobile engines are ncerned, the amount of heat so transferred is barely fficient, even under the most favourable circumances, for the completion of fuel vaporisation. I ink, however, that sufficient has been said on this bject for the present.

But when I find it seriously suggested that a partial r throttled) charge of the composition and nature ferred to is capable of acting as an accessory to overeating by mere "transformation of its energy of velocity to heat," I can only hope that Mr. Dugald Clerk is isrepresented. Consider the nature of the alleged source f heat: a current of air, its original (atmospheric) mperature lowered by forcible expansion, and still rther reduced by abstraction of its heat in order to ffect the evaporation of a finely divided volatile hydrocarbon! What is its velocity? Merely that due to a ifference in pressure of quite a few pounds per square ch, 14 lbs. representing a theoretical maximum mpossible not only of attainment, but even of approach, n actual practice. Is its motion suddenly arrested, as uch a theory would require? No, it is impelled into chamber of comparatively large area, in which it is ree to distribute itself in all directions.

If there were any truth in this theory, it appears to e that the heating effect should be most strongly pparent at the throttle, where the reduction of velocity ctually takes place, where the area of the gas passage s considerably more restricted than at any other point, nd where, owing to the forms of construction usually dopted, the impact of gas upon metal is comparatively iolent. I may be a most unobservant individual, but the interests of truth compel me to acknowledge that, in eleven years' motoring experience, I have never met with a single instance of such an occurrence; still, I am open to correction from any reader who finds that his throttle "overheats." It may be some tardy consolation to the competitors who in a recent reliability trial were stopped by frozen carburetters to learn that, according to what I conceive to be a reasonable application of this "theory," their carburetters should have been too hot to touch.

The Effect of Gas Retention.

With regard to Mr. Nevill's remarks headed "The Effect of Gas Retention," and to his statements elsewhere on this subject, I refer him to the well-known work of Professor Callendar, M.A., F.R.S., which distinctly demonstrates the inapplicability of Mr. Nevill's theories to the cycle motor. In fact, so closely do the Professor's general conclusions, on this and several other points, agree with the conditions observable in practice, that we are entitled to conclude from Mr. Nevill's statements either that the modern gas engine is technically inferior in design to the present day cycle motor, or that Mr. Nevill's indicator (or his observations therewith) is quite unreliable. I trust that this gentleman will not consider me unduly personal when I say that, having regard to his quoted remarks, and to the numerous minor inaccuracies to which considerations of space permit of no more than this passing reference, I consider it to be reasonably doubtful whether he has ever had any serious experience with air-cooled motors at all.

Finally, I would point out that the conclusions to be drawn from the explanation now advanced are in perfect agreement with the best practice of to-day, which is entirely an empirical product, having been developed by trial and error during the past twelve years, owing practically nothing but its working cycle to previous knowledge, and almost entirely unindebted to pre-existent data.

How to Prevent Overheating.

In order to minimise "overheating" troubles, as generally understood, it is desirable that:

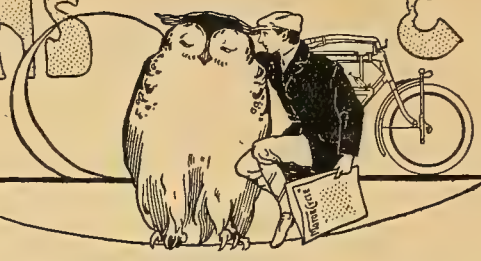
(*a.*) The ratio of gearing adopted under any given circumstances should be that, which does not impose any serious reduction of the engine speed from the normal. When, as on a hill, the speed of the machine (and consequently the cooling effect) is reduced by increase of gearing ratio, the latter must be such as to permit of maintenance of normal engine speed on a reduced (throttled) fuel charge.

(*b.*) The compression ratio should not exceed that degree which, at maximum throttle position, will produce a temperature of explosion the effects of which are capable of being efficiently (as below) dealt with by the cooling arrangements.

(*c.*) The minimum radiating surface allowable should be regarded as that which permits of the rate of radiation at normal working speeds equalling that of heat transmission through the walls at a temperature in the latter below that required to effect pre-ignition.

I have omitted all reference to data and formulæ, which are of no interest to the majority of motor cyclists. I may, however, mention that these strongly support the views herein set forth, notably that which I have advanced regarding the impossibility of the alleged "undue expansion of charge during admission."

QUESTIONS & REPLIES



A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and, whether intended for publication or not, **must be accompanied with a stamped addressed envelope for reply.**

Measuring the Engine and Gear.

I shall be obliged if you will inform me how to correctly measure the bore and stroke of an engine. Also how to find out the gear. I would also like to know what gear you consider best for a 2¾ h.p. engine, weight of machine 130 lbs., and rider 10½ stones.—H.O., Staffs.

You measure the bore of the engine with the aid of a pair of callipers and an engineer's rule. The stroke is found by measuring the length of the path through which the piston travels. Set the piston on the top of the stroke and pass a wire through compression tap, mark wire with a file, turn engine until piston is at bottom of stroke and again mark wire, the distance between the two marks is the stroke. To find the gear is a very simple matter. See that the belt is in position on the two pulleys, mark both of them, revolve the rear pulley once and count how many times the engine pulley revolves to one revolution of the former, which will give you the gear. A suitable gear for a 2¾ h.p. engine and 26in. wheels is 4¾ to 5¼ to 1, depending on the number of hills in your district.

Comfort of Lightweights.

I am thinking of purchasing a Motosacoche motor bicycle or a motor set from the makers of this machine. Can you please tell me if you think there would be any vibration in riding one of their machines, or if there would be any vibration in riding my own pedal cycle with a Motosacoche motor set attached? I notice there appears to be no sign of any springs, and I was wondering if they would be comfortable to ride. Do you consider them comfortable machines to ride, or would you advise me to have springs fitted to my bicycle or one of their machines if I adopted either? —C.P.

There is hardly any engine vibration at all from these machines. The usual amount of road vibration cannot be avoided, but this is practically negligible if spring front fork and large saddle are fitted. We should, however, strongly advise you not to fit the attachment to your pedal machine. The frames to which these attachments are fitted are specially strong, and, being designed for a particular purpose, an ordinary frame cannot possibly be as good.

Easy Starting with a Magneto.

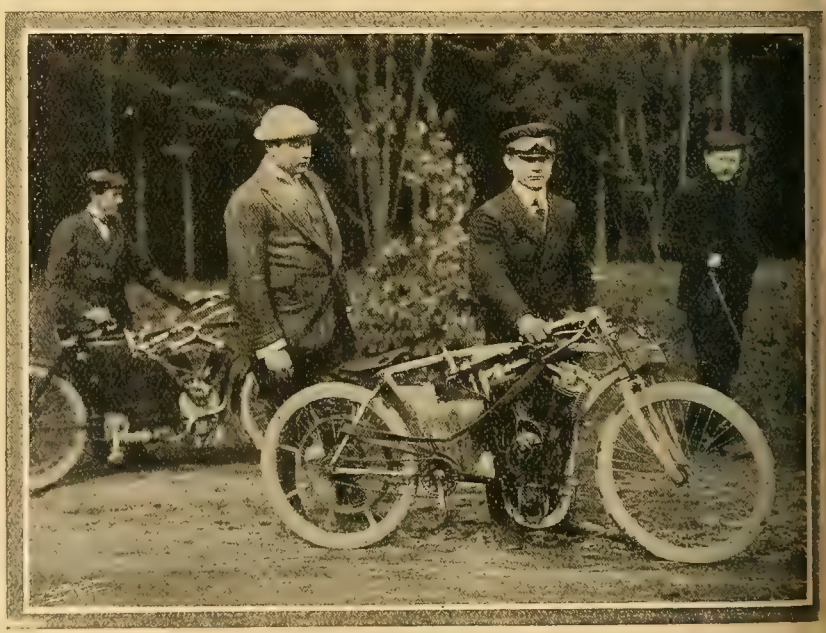
I possess a 3½ h.p. Triumph motor cycle with magneto ignition. Should it be possible for a nine stone rider of medium strength to start this machine on level ground by means of the pedals? I cannot do so at present. The method of running and then vaulting into the saddle appears too risky. If you can give me any suggestions whereby I could make the machine start easier, such as how to adjust magneto contacts, etc., I should be obliged.—E.A.B., Kettering.

Yes, the machine could be started by means of the pedals on level ground. The best way to make the machine start easily is to first of all inject paraffin into the cylinder to free the piston and rings, then flood the carburetter, open the throttle half-way, close the air and advance the spark lever almost fully, when the engine should start without any trouble. If you have interfered with the sparking plug gap you must adjust the points so that they are almost touching. Magneto contacts should be kept clean and flat. If fibre ring is worn obtain a new one.

Sidecars and Single Gears.

I am going to buy a sidecar attachment for my 3½ h.p. motor bicycle, and think of fitting a clutch to the bicycle. I am told that it will be impossible to start from a standstill without a two-speed gear. Is this so and is a change-speed gear absolutely indispensable for passenger work? I may mention I am not anxious to fit a gear if I can manage without one, owing to the increased complication.—A.J., Birmingham.

It should be possible to start from a standstill with a clutch and sidecar attachment if the machine is very low geared, and assisted by pedalling. Whether a two-speed gear is absolutely indispensable depends on the weight of yourself and passenger, the district in which you live, and whether you are averse to occasionally assisting the machine with the pedals on hills. If you are active, a great amount of fun can be obtained with a single-geared passenger machine in a level district, especially if the gear of the bicycle is suitably proportioned, but for serious touring a change gear is indispensable.



Ellischka, winner of the Prague Hill-climbing Competition, and his twin-cylinder Laurin and Klement racer. This machine has a low tension magneto, surface carburetter, and flat belt. The hill-climb is referred to in a paragraph on page 279.

Amount of Oil in Crankcase.

On draining the oil from the crankcase after a long ride should I give only one pumpful or two before running the bicycle again? The machine I ride is a 1908 Triumph.—N.H.W., Canterbury.

We should advise two to three pumpfuls of oil with this make of engine, after crankcase has been completely drained.

Picking up Speed after Changing Gear.

I have a 3½ h.p. Phœnix Cob, two speeds, magneto, which goes very well except for one thing. On coming to hills I have to get on to second speed very early, and on reaching the top I have difficulty in getting back to top speed unless the ground is level, or on a downward slope. Some time ago it picked up much quicker, and I cannot find out why it does not do so now. All the parts, valves, etc., seem in good condition.—M.D., Seaford.

Probably the carburetter is stopped up, or the compression of the engine is very weak. You had better overhaul the carburetter carefully and see that it is quite clear, also the feed pipe. If you close the air lever a notch or two after you have let in the high speed, it will assist the engine slightly in picking up.

Controlling the Engine Down Hills.

My 1¾ h.p. F.N. can be controlled in traffic nicely by two methods—(1) left handle control by switching the ignition off and on, or (2) right handle control by raising or dropping the exhaust valve lifter. The former is the easier, but does it harm the engine or belt? And which is the more effective way of cooling the engine on short dips in the road, turning off the ignition (handle control), or lifting the exhaust valve lifter?—J.B.M., N. Wales.

The more effective way of driving the engine is to control it by means of the exhaust valve lifter, which is kinder to the engine. When running down short hills raise the exhaust valve; when descending long hills the ignition may be switched off. Switching off cools engine quicker and better. Do not switch on unless machine is travelling fairly fast.

Non-sooting Plugs.

I have ridden for some time a Rex de Luxe motor cycle, with which I am very pleased. There is only one little fault which I should like to know how to remedy. I occasionally have trouble with the plug in the rear cylinder getting oiled up, but if I diminish the amount of lubricating oil the front cylinder runs short and is inclined to seize.—J.W., Stockport.

The only cure is to use a non-sooting plug, *i.e.*, a plug with protected points. The end of the plug is provided with a cap in which is a small orifice, the points are under the cap, and are thereby protected to a great extent from the oil. Smaller charges of oil injected at more frequent intervals are also advisable under the circumstances.

Magneto Points causing Difficult Starting.

I have a 3½ h.p. N.S.U. with magneto. The only fault I find is in starting when the engine has been going but has been stopped for a few minutes on the roadside. Several times after riding to a friend's house I have waited outside for him, and when I try to start it refuses to fire, and I have to put the bicycle on its stand and start the engine, which starts fairly easily on the stand. Even when the engine is hot the engine starts with slight difficulty. I think the mixture is all right, and I have the spark retarded. Could it possibly be the contact, because the points do not absolutely meet full, but one about half-way over the other?—L.B., Harrow.

The sluggish starting is almost certain to be due to the adjustment of the magneto points, which should meet full and square. Apparently, they have become worn, and need filing and adjusting closer together. For easy starting with N.S.U. machines the spark lever should be quite vertical. We would also suggest that the sparking plug points are not close enough together. They should be as close as possible without actually touching. Always inject paraffin into the cylinder after the machine has been standing for some time. This frees the rings and enables the machine to be started more easily, and to be pushed or pedalled faster, which is a most important fact when starting with any ignition. We have ridden some machines which require paraffin after remaining at rest only half an hour at this time of the year. The oil congeals very rapidly in cool weather; try a thinner oil except in summer.

The Noise of Motor Cycles.

While proceeding slowly down a lane the other day with exhaust valve lifted, the ordinary sound of the engine on dropping the lifter for a moment caused an unattended tradesman's horse to run away and damage another vehicle. I am sure this shying of horses must be an everyday experience with motor cyclists. Your valued opinion, therefore, as to whether I am liable for the damage would interest all, and be much appreciated by your readers.—COLLIS.

We have obtained a legal opinion with regard to this query, which is as follows: "The query of 'Collis' is one difficult to answer, as so much depends upon the exact facts of the case, and, moreover, the decisions of the Courts are rather contradictory. The general principle seems to be that if something is done negligently, which would be likely to make a horse shy, an action will lie. Your correspondent states in his letter that the shying of horses must be an everyday experience with motor cyclists, and therefore it is reasonable to suppose that he was aware that the dropping of the lifter might cause a horse to shy. If he had been on the lookout he would have seen that this horse was unattended, and under those circumstances I consider that there was negligence on his part. While the owner of the horse would probably be unable to sustain an action against the motor cyclist, yet the owner of the third vehicle might. It would be for a jury to decide whether the motor cyclist was guilty of negligence, and if so whether what happened was the natural consequence of such negligence. If your correspondent can settle the matter for a small sum he should do so, but in any event it would be best for him to consult a solicitor and explain the full facts to him."

On March 26th a reply to a query was sent to Mr. A. Cooke, 24, King Street, Liverpool. On March 28th the letter was returned marked "insufficient address." Will Mr. Cooke please send his proper address?

READERS' REPLIES.

I have precisely the same trouble with my Quadrant tricar as A. H. (Hanley). My experience of the popping sound in exhaust has been a great trouble. I had my machine thoroughly overhauled by a good firm, and drove about 100 miles all right. After that time (in cold weather) I went a short spin and the popping commenced again, but only when using the high speed gear; it would go all right on low speed. Could the trouble possibly be due to inlet valves not opening and closing properly? as I fancy the springs are not tempered perfectly. My coil is a plain one. I shall be glad if A. H. (Hanley) will communicate with me, c/o the Editor—I shall then know if either of us has got rid of the trouble, and how. I may say the answers to questions which I habitually read in *The Motor Cycle* are most valuable and instructive.—A. D. WALKER.

I notice a letter from a correspondent who has had trouble with a 3½ h.p. Minerva. He states that the engine comes to a sudden stop as if all brakes were on. I have had nearly 15,000 miles experience with Minervas, and I may say I had an exactly similar experience. I tried for some time to find out the cause, but could not, until one day I took the contact breaker completely to pieces. I then discovered that the platinum tip on the screw was loose and sliding up and down inside the end of the screw. Of course, it made and broke contact anywhere but at the correct point, and thus the sudden stoppages were merely bad backfires, which with a chain drive would have pitched one over the handle-bar or broken the chain. On fitting a new screw the trouble disappeared.—G.H.A.

¶ *"THE AUTOCAR," which is published under the same proprietorship as "The Motor Cycle," is to the automobilist what this journal is to the motor cyclist. Any reader of "The Motor Cycle" who is also considering the purchase of a car should make a point of obtaining "The Autocar"—the leading motor journal. Price 3d. Issued weekly.*

Brooklands Automobile Racing Club.

MOTOR CYCLE REGULATIONS approved by the A.C.U., in accordance with Rule 3 of the Racing Rules of the B.A.R.C. The indented rules are those adopted by the Royal Automobile Club for cars.

1. DEFINITION: In these regulations the word "rule" shall mean one of the racing rules of the Brooklands Automobile Racing Club, as adopted by the Royal Automobile Club.

2. Rule 9 shall not apply, but the distance of the track shall be measured 10ft. from the inner edge.

9.—The length of the track shall be the distance to be traversed, measured 50ft. from the inner edge.

3. Rule 11 shall not apply. All classification of vehicles, and all regulations in respect thereof, shall be framed by the Brooklands Automobile Racing Club, but require the approval of the Auto Cycle Union.

11.—Classification of vehicles, and all regulations in respect thereof, shall be framed by the Club.

4. An official programme, as provided by Rule 13, shall be sent to the Auto Cycle Union.

13.—At least twenty-four hours before the time announced for the commencement of the meeting, the Club shall furnish to the Automobile Club and to each entrant an official programme, clearly marked "Official Programme" on the face thereof, which programme shall contain in its final form the information required to be given in the announcement of the meeting, together with particulars of the entries accepted for each competition, the arrangement and times of the various competitions, the names of the entrant and driver of each vehicle, the identification number or mark which each vehicle will carry in the meeting, and the handicap, if any, and if not sealed. Any assumed name shall be indicated on the official programme by inverted commas.

5. Rule 22 shall not apply.

22.—No vehicle, while competing, shall be pushed, aided, or set in motion by any persons other than the driver and his assistant, if an assistant be carried.

6. In Rule 25 the words "Auto Cycle Union" shall be substituted for the words "Automobile Club."

25.—No competitor shall be eligible to enter a vehicle for or drive a vehicle in any competition unless the name of such competitor is duly entered upon the Competitors' Register of the Automobile Club. The competitor shall produce the certificate of registration of the Automobile Club on the demand of an official of the Club at any meeting.

7. In Rule 26 the words "five shillings" shall be substituted for the words "half a guinea"; and the words "half a crown" shall be substituted for the words "five shillings."

26.—The fee for such registration of a competitor is half a guinea, except in the case of a member of the Automobile Club or of a club affiliated to the Automobile Club, in which case the fee is five shillings.

8. In Rule 28 the words "ten shillings" shall be substituted for the words "two guineas."

28.—On payment of an additional annual fee of two guineas a competitor may be registered under an assumed name approved by the Automobile Club; provided that the competitor while registered under such assumed name shall not compete under any other name.

9. After the word "Handicappers" in the eighth line of Rule 36 the following words shall be inserted: "But these shall be officials of the Auto Cycle Union." The remainder of Rule 36 shall stand.

36.—The following are the recognised officials of a meeting, and their appointment shall be subject to the approval of the Club, viz., three stewards, a judge, a starter, a clerk of the scales, and a clerk of the course. In case of emergency the stewards present may appoint unauthorised substitutes or assistants to fill or assist in any of the above-mentioned offices. There may also be appointed timekeepers and handicappers. No official of the club, whether temporary or permanent, shall be eligible to compete in any competition at a meeting at which he is officiating.

10. No rider shall use more than one machine in a contest; he shall only be allowed one starter, and this only where the race proposition does not prohibit starters.

11. Hand-timing shall be permissible for Auto Cycle events, provided all timing certificates state the fact that hand-timing was used, and provided arrangements have been made with the Brooklands Automobile Racing Club.

12. Rule 56 shall not apply, the following rule being substituted: "All handicaps shall be framed by an official handicapper of the Auto Cycle Union."

56.—All handicaps shall be framed by an official handicapper appointed by the Club.

13. PROTESTS: In Rules 71, 72, and 75, the words "Auto Cycle Union" shall be substituted for the words "Automobile Club," and, in Rule 71, the words "two pounds" shall be substituted for the words "five pounds."

71.—Every protest shall be in writing, and must be signed by a competitor engaged in the competition, or by his authorised agent, and must be lodged with the clerk of the course within the time prescribed by these rules; the person protesting shall, at the time he makes the protest, deposit in the hands of the person to whom the protest is made the sum of £5. If the protest be decided against the depositor, his deposit shall be forfeited to the Club unless the stewards who heard the case, or the stewards of the Automobile Club, on appeal, shall certify that there was good and reasonable ground for the protest or the appeal.

72.—All protests shall be adjudicated upon by the stewards. All parties concerned shall be given an opportunity of being heard, and shall be bound by the decision given, subject only to appeal to the stewards of the Automobile Club as herein provided.

75.—(i.) A protest against a vehicle as to classification and validity of entry (otherwise than as provided by Rule 31) must be made before the start of the competition.

14. CORRUPT PRACTICES: In Rule 79 the words "Auto Cycle Union" shall be substituted for the words "Automobile Club."

79.—Any person who shall knowingly enter for or take part in a competition not being held under the Competition Rules of the Automobile Club of Great Britain and Ireland, or under these rules, or who shall be guilty of any misbehaviour or unfair practice in connection with automobilism, whether relating to competitions or not, shall be deemed to be guilty of a breach of these rules.

15. DISQUALIFICATION AND SUSPENSION: In Rules 81, 87, and 89, the words "Auto Cycle Union" shall be substituted for the words "Automobile Club."

81.—The stewards may, on any complaint being made to them or on their own initiative, take cognisance of and deal with any breach of or offence against these rules by the suspension of any person or in such other manner as they may think fit, subject only to an appeal to the Automobile Club as provided by these rules, and such suspension shall be reported to the Automobile Club.

86.—Any person who shall have been suspended in accordance with these rules may be suspended by the Automobile Club from taking part in any competition and may be struck off the Competitors' Register.

87.—Suspension may be either temporary or permanent; if temporary, it shall be recorded in the Competitors' Register, if made permanent by the Automobile Club the competitor's name shall be struck off the Competitors' Register; and no person shall be allowed to enter or take part in any competition under these rules while under sentence of suspension.

89.—The Club or the Automobile Club may, in their absolute discretion, and in such manner as they may think fit, notify or cause to be notified to the public that any person has been disqualified or suspended, and the name of such person. No action or any proceeding shall under any circumstances be maintainable by the person referred to in such notification against the Club or the Automobile Club, or against any person publishing or circulating the same, and this rule shall operate as leave to the Club and the Automobile Club and to any such person to publish and circulate such notification and be pleadable accordingly.

16. APPEALS: In Rules 91, 92, 93, 94, 95, and 96, the words "Auto Cycle Union" shall be substituted for the words

Brooklands Automobile Racing Club.—

"Automobile Club," and, in Rule 90, the words "ten shillings" shall be substituted for the words "twenty-five pounds."

90.—If any person is aggrieved by a sentence of disqualification or suspension under these rules, he shall, upon giving written notice to the secretary of the Automobile Club, within forty-eight hours of the decision against which he appeals being made known, accompanied by a deposit of £25, have the right of appeal to the stewards of the Automobile Club, appointed as provided by the rules of the Automobile Club for the time being.

91.—A sentence pronounced by the stewards of the Automobile Club shall be final and without appeal, and shall be binding on the Club and all other persons for all purposes. The stewards of the Automobile Club may authorise a statement to be inserted in the *Automobile Club Journal and Motor Union Gazette* of any decisions under this rule.

92.—The deposit shall be forfeited to the Automobile Club or shall be returned to the appellant, as the stewards of the Automobile Club may determine.

93.—If the stewards of the Automobile Club shall be of opinion that the fault committed demands a penalty greater than that which has been imposed, they shall have power to increase such penalty.

94.—The stewards of the Automobile Club shall have power to inflict fines and order payment of costs at their discretion.

95.—In no case shall the stewards of the Automobile Club have the power to order a competition to be run again.

96.—All appeals referred to or brought before the stewards of the Automobile Club for their decision shall be decided by a quorum of not less than three stewards of the Automobile Club. The stewards of the Automobile Club may call to their aid any stewards or other officials or members of the Club, and may procure such professional and other expert assistance as they may deem desirable.

17. The supplementary regulations of the Brooklands Automobile Racing Club shall apply with the following alterations:

In Regulation 5 the amount "10s." shall be substituted for the amount "£5."

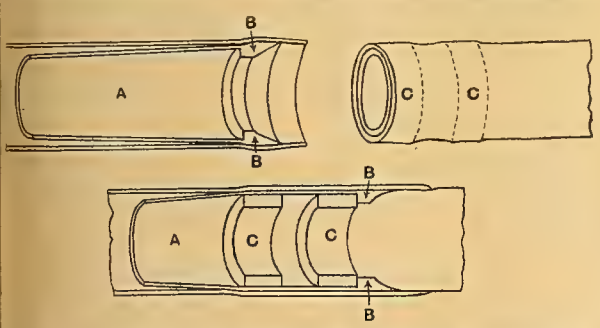
5. FINE FOR NON-STARTING: Every entrant whose vehicle fails to take part in the race for which it is entered shall be fined £5, unless he shall have notified the clerk of the course, in writing, prior to the publication of the official programme of his intention not to start. This fine shall be paid to the clerk of the course within seven days of the time appointed for the race; non-payment of the fine shall debar an entrant from entering for any races, and may entail further steps being taken against him by the Club.

18. NUMBERING OF VEHICLES: Every entrant shall provide and fix at his own expense such number or numbers as may be prescribed by the Brooklands Automobile Racing Club.

A DETACHABLE JOINTED TUBE.

THE illustration herewith is that of the Hermetic detachable jointed air tube made by the Self-sealing Rubber Co., Ltd., Birmingham; the joints can also be fitted to any ordinary air tubes mentioned in their list.

To make the joint, the end of the air tube containing the rubber rings C C is flattened and folded, when it can be readily passed through beyond the flange B on the other end of the air tube. The application of a little soft soap or French chalk renders the operation



a very easy one. It is important to note that both of the rings C must be pushed beyond the flange B. Care must also be taken that the air tube is not twisted.

To separate the joint it should be flattened and folded slightly, when the two ends of the air tube can be readily separated.

When fitting these air tubes into covers care should be taken that the tube is so fitted that the mouth of the detachable joint faces the running direction of the tyre.

Zenith Motors, Ltd., ask us to point out that the Gradua gear is not suitable for fitting to existing motor cycles on account of the cost of the necessary alterations, but the gear can be incorporated with any machine when it is being built up.

A NEW SPARKING PLUG.

THE sparking plug which we illustrate on this page is a specially made plug called the Reliance, sold by Messrs. S. and F. Stephenson, 19, Canning Place, Liverpool. It differs from ordinary sparking plugs in the matter of the insulated central wire. This is a hair-like platinum wire protected from corrosive action by being baked in, and being brought flush with the surface of the porcelain insulator. It is claimed that the spark in leaving this minute point is concentrated and intensified to such a degree that the heat and scouring action of the spark, being directed against the surface of the insulator, instantly destroys any short circuiting matter surrounding the point. The Reliance plug is manufactured by the Jeffery-Dewitt Co., New Jersey, U.S.A., and it is said that it will spark under water, and therefore under any conditions obtaining in a petrol engine cylinder, as combinations of oil and carbon cannot be compared with water as a short circuiting matter. The English agents have kindly sent us a sample sparking plug, and we shall hope to say what we think of it after trial.

If the variable speed pulley, adjustable from the saddle, is to be a real success, the firm of Osborne Bros., Princess Works, Lincoln, should reap the benefit of their pioneer work. They were the original inventors of the variable speed pulley obtained by sliding a loose flange in or out, so raising or lowering the belt in the groove of the pulley to suit the prevailing road conditions. The makers have just issued a new catalogue showing the mechanism in detail, and describing how the pulley and change speed lever are fitted to any machine.

CURRENT CHAT.

Special Features.

BROOKLANDS RACING RULES.

A FEW DAYS IN THE PYRENEES. (Illustrated.)

The End-to-end Run, July 13th to 18th.

Special hotel arrangements are being made at the various stopping places for the competitors in the End-to-end trial, very much on the same lines as on the previous trial.

A Club for Stockport.

Stockport has followed the lead of most other large towns and formed a motor cycle club. There are over 100 motor cyclists in the town.

A Hint.

Nottingham is one of the few large towns in the British Isles with no motor cycle club. It is not, however, owing to any dearth in the number of devotees of the pastime of motor cycling in this district, but to a want of unity. Probably when a few influential motor cyclists get together a determined effort will be made to form a club.

How to Win Hill-climbs.

A correspondent writes this week with reference to the article "How to Win Hill-climbs," published on March 25th, and points out that the sentence "Power absorbed by wind resistance varies inversely as the speed," should read "Varies directly as the square of the speed." We make the necessary correction with pleasure. The paragraph is fully explained on page 231 in the article "Selection of Gear Ratio."

The Motor Cycle Race at Brooklands.

Intending competitors in the first motor cycle race at Brooklands at Easter are reminded that entries close to-morrow (Thursday) to the Brooklands Automobile Racing Club, Carlton House, Regent Street, S.W. The regulations being so simple, and the entry fee so low (10s.), considering the value of the first and second prizes, we expect to see a good turn-out. The rules affecting motor cycle racing on the Brooklands Track are published on page 276-7 this week.

Damage to Roads by Motor Vehicles.

"Taxpayer," Coventry, writes to *The Daily Chronicle* pointing out "the enormous damage done to the roads by cars and motor cycles being tested by the various makers." It is obviously absurd to put the harmless motor bicycle on the same level with heavy motor cars as road damaging machines, and we have yet to have proved to us that motor bicycles damage the roads in any way. It is rather strange that this complaint comes from Coventry, a city dependent almost entirely for its existence on the motor and cycle trades.

"The Motor Cycle" Spring Number.

Among the more important features of the special spring number of *The Motor Cycle* to be published on May 6th will be a special illustrated supplement by E. H. Thomas, the well-known motor cycle artist, entitled "Brooklands, an Impression of Speed." "Our Historic Highways," by R. Wellbye, with illustrations. "The Motor Cycle for Business Purposes," by Bagman. "Motor Cycling for Health," being the experiences of medical men who are also motor cyclists, etc., etc. Additional features will be announced in a subsequent issue.

A Reprehensible Trick.

On page 45 of the advertisements last week, the first advertisement under the heading "Too late for classification" seems to be an attempt by some individual at an exceedingly poor form of joke, since the whole affair appears to be a hoax. The unfortunate reader who has been victimised, Mr. Davison, has had thirteen telegrams, a large number of letters, and about thirty people applying at his house, among whom was a gentleman who came all the way from Wellingborough. Needless to say, we think behaviour of this kind is most reprehensible, and we take this opportunity of expressing our sympathy with Mr. Davison.

Motor Cycle Touring.

The next of the very interesting series of papers to be read before the members of the Auto Cycle Union is in the hands of that very good authority on "Motor Cycle Touring," Mr. A. Candler, the hon. sec. of the M.C.C. In view of Mr. Candler's wide and varied experience, he having undertaken several tours on the Continent on motor cycles, the paper should be of unusual interest, and some useful "hints and tips" should be gleaned. Any interested reader of *The Motor Cycle* may obtain a ticket of admission to the reading of the paper, at 119, Piccadilly, W., on Friday next, 10th April, at 8 p.m., on application to the secretary Auto Cycle Union, 18, Down Street, Piccadilly, W.

The Spelling of "Auto-Cycle Club."

In *The Bicycling World and Motorcycle Review*, issue March 21st, a reference is made to the spelling of the title of our governing body, namely, "Auto-Cycle" Club. This New York journal, which is apparently rather badly upset that the English press and principal British motor cycling bodies will not accept any promiscuous record that is sent over from the U.S.A., finds great fault with the manner in which the name of the club is written, namely, in three separate words. Surely this is a case of the pot calling the kettle black. Had we been asked our opinion as to how the American Club would have spelt it, we should imagine it would have been printed "Ortosycle-klub." As a matter of fact, the names as spelt "Auto-Cycle" Club and "Automobile" Club call for criticism from the etymological expert, but an American editor can hardly be expected to be a sufficiently good authority on either grammar or etymology to detect exactly where the fault would lie in this direction.

Appropriate.

Situated at the crux of the steep Chislehurst Hill, a bit of 1 in 7 where many single-geared machines fail, is an inn rejoicing in the name of the Ramblers' Rest. We suggest that a motor cycle rest or two for overheated engines should be provided.

Excessive Speed Victim.

The first victim of the new police ruling at Bromley is a Beckenham motor cyclist who last week was relieved of £1 and 8s. costs for travelling at "excessive speed" on a new and untried 2½ h.p. machine. At the same court the driver of a two-seated car, alleged to have done 38 m.p.h., and who admitted that it was a high speed car which could not be driven very slowly, was summoned for merely exceeding the legal limit.

A Fine Tricar Spill.

It is very pleasing to see the *Mirror's* adjudged to be "most beautiful girl in England" is the sister of a Southern motor cyclist, and shares his enthusiasm for our splendid pastime. From the published photograph of the lady in the *Mirror* she is quite the motor cyclist's ideal lady passenger. She informs the *D.M.*, "I like walking, climbing hills, and riding in a trailer. Not long ago I had a fine spill off a tricar, but wasn't a bit the worse." Of the interesting young lady it is further said, "Besides many spills from her cycle and the family tricar, she has had one perilous adventure—she was nearly drowned in the Thames." There is evidently something seriously amiss with the "family tricar." Still with such a charming passenger one could naturally overlook the driving a bit. We trust her next charioteer will be more expert.

FOR TOURING FOR TWO

A RILEY TRICAR

IS IDEAL

POWERFUL & RELIABLE
FAST & SILENT

Should it be your intention to tour, then you require a stable 2-seater—such as the Riley tricar. Remember, tinkering and touring do not go well together, while the Riley tricar has a well-earned reputation for reliability under all kinds of weather and road conditions.

Don't delay your decision—there is usually a big demand for a good article.

5 h.p. Riley Tricar - 85 guineas.

Loss of Life through a Broken Spindle.

We regret to record a sad accident at Clifton on Tuesday evening of last week by which Harry Lawson Pendlebury, a member of the Bolton Motor Cycle Club, lost his life. Mr. Lawson was riding home from Manchester through Clifton when he was thrown over the handle-bars of his machine owing to the front spindle breaking. Mr. Jos. Pendlebury, deceased's father, said his son was in business in Manchester as an analytical chemist, and had ridden a motor bicycle regularly to business for about two years. The Coroner considered the front spindle was not sufficiently strong for a motor cycle, a view with which the jury agreed. It should be added that no spring forks were fitted.

Motor Cycling for Health.

One of the special features to be included in our spring number will be an article "Motor Cycling for Health," being the opinions of medical men who are actual users of motor cycles. We ask the hundreds of doctors who are readers of *The Motor Cycle* to be good enough to co-operate with us in this article, and the Editor will be pleased to send on a form with four questions to be answered (limit 100 words) to those who apply for one.

Brooklands Track Re-opened.

The Brooklands motor course was re-opened after repairs on Saturday last at 10 a.m. It is, as a rule, open on week days during the hours from 10 to 5 in the winter months, and from 10 to 7 in the summer months, on days when no race meetings or other trials are taking place. Private matches can be arranged by applying to the Clerk of the Course at Carlton House, Regent Street, S.W.

The Inter-club Meet at Richmond.

The Hull A.C.C. and Hartlepools M.C.C. will join in the inter-club meet of Northern motor cyclists at Richmond, North Yorkshire, on Good Friday. This makes seven clubs attending the meet, viz., Middlesbrough, Leeds, Bradford, Newcastle, Sheffield, Hartlepools, and Hull. Last Easter six clubs took part, including the Sunderland Motor Cycle Club, and there were upwards of 200 motor cyclists present.

The Hill-climb near Koenigssaal, Prague.

Fine weather and a representative list of entries co-operated in drawing a big crowd to the gradient between Königssaal and Jilowischt, some eight miles from Prague. Amongst the spectators figured the Archduke Karl Franz Josef, who drove up in a six-cylinder Minerva. Major Wolf, one of the keenest motorists in Austria, was also there. The results of the motor cycle contests were as follows: Cycles up to 65 kilos.—1, Ellischka (Laurin and Klement), 4m. 24⅘s.; 2, Swoboda (Laurin and Klement), 4m. 41⅘s. Cycles up to 0.6 litre.—1, Lad (Walter), 5m. 31⅘s.; 2, Rada (Walter), 7m. 7s.; 3, Belsky (Peugeot), 8m. 49s. Cycles over 0.6 litre.—1, Houtzvicka (Laurin and Klement), 5m. 33⅘s.; 2, Slavik (Laurin and Klement), 5m. 47s.; 3, Dietrich (S. Walter), 6m. 3⅘s. Motor bicycles with sidecars.—1, Pitschek (Laurin and Klement), 7m. 11⅘s.; 2, Storch (Walter), 7m. 42⅘s.; 3, Kral (Laurin and Klement), 7m. 57⅘s. The course was about 5.5 kilometres in length. Arrangements were in the hands of the Cesky Club Automobilistu and the Cesky Club Motorcyclistu.

The Auto Cycle Club of France Reliability Trial.

The date of the Tour de France trial for motor cycles and voiturettes has again been changed, this time to May 12-18th. The reason for the change of date given by the organisers is that the weather is more settled in May than April. The following entries in the motor cycle classes have been received up-to-date: Class 1, Motor Bicycles.—Quentin 2, Alcyon 2, Werner 1, Lurquin-Coudert 2, Peugeot 2. Class 2, Motor Bicycles.—Alcyon 2. Class 3, Tricars.—Mototri-Contal 2, Ronteix 1, Quentin 1, Ateliers du Turan 3, Sourian and Co. 1, Berujeau 1.

FUTURE EVENTS.

April 16-20—M.C.C. Easter Tour.
" 18 and 20—Brooklands Car and Motor Cycle Races.
" 19 (Easter Monday)—Lincolnshire M.C.C. Hill Climb.
" 22-28—Auto Cycle Club of France Reliability Trials.
" 25—A.C.U. Quarterly Trial.

" 13-18—A.C.U. Land's End to John-o'-Groat's Six Days' Reliability Trial.
" 25—Motor Cycling Club's Petrol Consumption Tests.
Aug. 3-4—M.C.C. Run from London to Land's End and Back for Charles Jarrott Cup.
" 8—Essex M.C. Open Race Meeting at the Stadium, Shepherd's Bush, W.

Notes on the Cudham Climb.

The police veto at Carter's Hill seems to indicate that open hill-climb competitions will only be possible on practically disused roads this year.

Two Cudham records were established. The Lagonda and Daneville were the first passenger machines to climb the hill, whilst a twin Rex carried a passenger up—another record.

A well-known motor cycling tourist present said, "It beats any Devonshire hill I know for trickiness."

It was a "surprise" climb in every way. Two-thirds of the competitors were acquainted with the hill by reputation only, and there was no time for trials, but in many cases lower gears were fitted.

It is essentially a "two-speed" hill. Had Cudham been decided upon at the outset a two-speed class would probably have filled well.

Humber, Ltd., will make Motor Cycles.

It is stated that Humber, Ltd., is about to re-commence the manufacture of motor cycles, and will shortly place a new pattern motor bicycle on the market. We are particularly pleased to hear of such an important firm re entering the industry. Humber motor cycles had a considerable run a few years ago, and practically every motor cyclist recognises a Humber car when he meets one on the road. We hope shortly to see as many new pattern Humber motor cycles on the road as there are Humber cars.

A New Official for Brooklands.

The Brooklands Automobile Racing Club has decided to appoint an official measurer and inspecting engineer, and has retained the services of R. H. Waymouth Prance.

Affiliated Clubs.

The following ten clubs have signed the new agreement for affiliation to the Auto Cycle Union and association with the Royal Automobile Club: Cambridge University M.C.C., Scarborough and District M.C.C., Sheffield and Hallamshire M.C.C., Bradford M.C.C., Worcester M.C.C., Birmingham M.C.C., Lancashire M.C.C., Lincolnshire M.C.C., Newcastle and District M.C.C., and North-west London M.C.C.

Lights on Vehicles Act, 1907.

The Highways Protection Committee of the Motor Union are desirous of ascertaining whether the Universal Lights on Vehicles Act is being observed, and if not, whether the police are taking proceedings against offenders. If the Act is not being properly enforced, the M.U. would be glad to receive suggestions as to the action it may usefully take in the matter.

Motor Mania Catching.

A Sheffield correspondent asks, "Don't you think the motor mania is catching? I have only had my motor cycle two months and three of my friends have bought similar machines."

Permits for Open Events.

The Auto Cycle Union has granted permits to the Essex M.C. for three open events this year, viz., hill-climb on May 9th, 200 miles reliability trial on July 4th, and third annual race meeting at the Stadium on August 8th.

An Amateur's Chances in the Brooklands Race.

Every private owner of a fast motor bicycle stands an equal chance in the first Brooklands Motor Cycle Race, and we should not be surprised to see more amateurs in the race than trade riders. We have heard of a Coventry rider who is busily tuning up a 3½ h.p. single-cylinder machine, and with a 3¼ to 1 gear expects to be among the first home. A high-powered engine does not necessarily win in a flat race, it is the engine that can get round the fastest with the highest gear that is successful in a race of this kind. The B.A.R.C. tells us that a large number of entry forms have been applied for.

The Lewisham A.C. Open Hill-climb.

ON arriving at Sevenoaks, after a swift and pleasant run on one of Mr. S. F. Edge's gliding 30 h.p. Napiers, we were informed that the police were unfavourably disposed towards the holding of the above competition on Carter's Hill. When about half an hour had elapsed, and the hungry competitors, officials, and spectators had satiated their appetites, instructions were given to proceed to the Rose and Crown Inn, Green Street Green, and there await orders. All that Saturday morning motor cyclists came streaming down the main road, far outnumbering all other self-propelled vehicles, and even while the goodly company was waiting for the arrival of the secretary, Mr. H. B. Renner, numerous spectators, all mounted on motor bicycles, sidecars, and tricars, came hurrying by on their way to Carter's Hill. Fortunately a number of these saw the crowd, halted, received the news, and joined the rapidly swelling throng. The move was well carried out, and, after a wait of not very long duration, the official cars, and a few motor cyclists, proceeded to the Church Hill, Cudham, not, however, before Mr. Edge himself (one of the judges), who was among the first to arrive to inspect this steepest of hills. Prettily situated in the wooded country for which the county of Kent is so famous, Cudham Hill lies about a third of the way between Green Street Green and Westerham, and is approached by a well kept by-road, which leads to the top of the hill. In a few minutes the course was chosen, and a few words describing it may not be out of place.

Cudham Hill.

For about two-thirds of the way up the road is practically straight, the gradient rapidly attaining great severity; then come two rather sharp bends, which are difficult to negotiate at speed, and then the finish on an almost precipitous section of one in four point three. At first it was thought that comparatively few of the competitors would get up, but when Reynolds made a successful attempt on his twin-cylinder Vindec, the hill did not seem quite so impossible; but never for a minute was its severity doubted, since every well negotiated climb was greeted with enthusiastic applause. In a short space of time all was ready. J. H. Burley, the timekeeper, descended to the starting point, followed later by A. G. Reynolds, who soon marshalled the competitors in their correct order as soon as they arrived, word having been sent by a spectator mounted on a motor bicycle that they should leave Green Street Green immediately and proceed to the foot of Cudham Hill. By this time the number of spectators, nearly all of whom had arrived by motor cycle, had largely increased, and later on in the afternoon some followers of the local pack of hounds, whose hunters were quiet enough to stand the ordeal, took a great interest in the event. One gentleman who wore pink, standing as he did in a conspicuous position, was mistaken by the starter for a danger signal!

An Unqualified Success.

The actual competition was an unqualified success. In Class I., for single-cylinder machines, there was, contrary to all expectations, only one failure. The first machine to make the ascent was the 3½ h.p. Zenette driven by F. W. Barnes. It was the heaviest machine in its class, and though it came up slowly, it did so in good form, the variable gear working faultlessly. C. B. Heath (4½ h.p. Noble) mistook a signal from an official, and, checking his speed, failed to get under way again. On a second attempt he was quite successful. All the rest were most enthusiastically applauded, especially Jacobs, Webb, Lee Evans, Brice, McMinnies, and Le Grand, whose little 2½ h.p. Matchless made a wonderful performance. Its bore is only 70 mm., and the average bore in Class I. was 80 mm. The differences in the times made in this class less the handicap are as follows: J. P. Le Grand (2½ h.p. Matchless), 0; G. Lee Evans (3½ h.p. Rex), ⅖s.; W. G. McMinnies (3½ h.p. Triumph), 2⅗s.; R. M. Brice (3½ h.p.

The Lewisham A.C. Open Handicap Hill-climbing Competition.

Competitors assembled on The Rose and Crown Green. The gradients of Cudham Hill were published in "The Motor Cycle" of March 19th, 1906, as follows: "Soon after the start it is 1 in 4·8, and immediately following a rather awkward curve of the same grade, the concluding bit of cliff of 1 in 4·3 is struck."

e Lewisham A.C. Open Hill-climb.—

rown), 5⅘s.; W. A. Jacobs (3½ h.p. Rex), 7s.; . A. Cooper (3½ h.p. Triumph) and C. B. Heaton h.p. Noble), equal, 7⅘s.; W. F. Thomas (3½ h.p. riumph), 8s.; Stanley Webb (3½ h.p. Triumph), ⅘s.; F. W. Barnes (3½ h.p. Zenette), 18⅗s. All ho made fast times in this and the following ass had considerable difficulty in driving round the orners, especially the higher of the two. In the cond class for multi-cylinder machines all those who ompeted did excellently, but not one could take the orners without switching off. Results: F. W. pplebee (5 h.p. Rex), 0; O. L. Bickford (5 h.p. indec), 2⅘s.; F. Applebee, jun. (5 h.p. Rex), ⅗s.; W. H. Wells (5 h.p. Vindec), 7⅕s.; O. C. odfrey (5 h.p. Rex), 8s.; A. J. Sproston (5 h.p. indec), 9⅗s.; J. S. Shaw (5½ h.p. Phänomen), 3⅖s. (this rider was hampered during his ascent, nd forced to come down on to his lower speed, when e might have gone up on top, he did not, however, aim a second attempt); R. D. Yearsley (6 h.p. airy), 21⅘s. In Class III., for lightweight achines not exceeding 95 lbs., only two machines ade a successful ascent, namely, the 2½ h.p. Fairy nd the 1¾ h.p. Chase; the official results, however, iffer from our own personal notes, in that the results ven are as follows: G. L. Fletcher (2 h.p. Moto-êve) missed fire badly, owing to partly obstructed arburetter, 0; A. A. Chase (1¾ h.p. Chase) came up well with hard pedalling, 4⅘s.; J. V. Robinson (1¾ h.p. Motosacoche), rider dismounted, 7⅕s.; J. B. Beck (2½ h.p. Fairy) came up in good form, 13⅘s. In Class IV. the only entrant failed to ascend the hill. Class V. (passenger motor cycles): W. Gunn (12 h.p. Lagonda), 0; B. Pattison (14-16 h.p. Daneville), 21s. The whole event was highly successful, as out of a total entry of thirty-four, twenty-nine actually took part in the contest. Among the officials were: Judges, Messrs. S. F. Edge, V. Hart, A. G. Reynolds, and E. M. P. Boileau; marshals, H. B. Renner and A. J. Macdonald; timekeepers, F. Straight and J. H. Burley; there were also several gentlemen who acted as stewards.

Owing to an accident sustained some time ago, Miss Muriel Hind was unable to compete.

The officials wish to thank the Sevenoaks Motor Co., who, when they heard that the police had stopped the competition at Carters' Hill, placed a car at the disposal of the hon. secretary (Mr. H. B. Renner) to transport them to Cudham, ten miles distant.

We are also asked to announce that Thursday, April 16th, at the Green Man Hotel, Southend, Catford, 8 p.m., is the date fixed for forming the new S.E. Auto Cycle Association, which will then take over the Lewisham A.C. Every motor cyclist in S.E. district is invited. The proposed subscription (half a guinea) is to include affiliation to the A.C.U. and association with the R.A.C.

CLUB NEWS.

Worcestershire M.C.C.

At a meeting held on Saturday last six new members were ected, making a total of thirty. The next meet will be on aturday, the 11th inst., at Broadway, tea at the Lygon rms; meet at headquarters at 3 p.m.

Hartlepools and District M.C.C.

The opening run is to Richmond on Good Friday, meeting Grand Hotel at 9 a.m.; Saturday, April 18th, meet at aledonian Road, 2 p.m.; Easter Monday, meet at Cale-onian Road, 9 a.m.; Easter Tuesday, meet at Caledonian oad, 1 p.m., destination Yearby Bank, near Redcar, to itness Middlesbrough M.C.C. hill-climb.

Brighton and District M.C.C.

On Saturday next a hill-climbing competition will be held, everal prizes having been given. The hon. sec. would like o state for the information of motor cyclists in Brighton and istrict that the subscription is 5s. per annum and entrance ee 2s. 6d. Headquarters are the King and Queen Hotel. 'articulars of membership can be obtained from the hon. sec., I. Clifton, Ship Street, Brighton.

Richmond and District M.C.C.

At the annual dinner of the above club, it was decided to sk the Marquis de Mouzilly St. Mars to be the president gain, and Mr. A. Carpmael was re-elected captain, and Mr. ancaster elected vice-captain. The officials intend to pursue vigorous programme during the present year; competitions nd week-end trips will be arranged, and it was promised y one of the members to arrange a balloon chase, and pro-ably a substantial prize will be offered to the first "motor ounds" in at the death. Mr. Angell tendered his resigna-ion as hon. sec., which was much regretted by the members resent. A hearty vote of thanks was unanimously passed o him for the able way in which he had carried out the nerous duties of the position. Mr. H. C. King was asked to ccept the office of hon. sec., which he agreed to do.

The meets are generally held at the "Maypole," Surbiton, nd the hon. sec., Mr. H. C. King, Walton House, Surbiton oad, Kingston-on-Thames, will be pleased to hear from any gentlemen residing in the Richmond or Surbiton districts who wish to join the club.

Ayr and District M.C.C.

The opening run of the above club has been fixed for Wednesday, the 15th inst., to Largs. Members meet at head-quarters, Tramway Hall, Prestwick Road, at 10 a.m. It is hoped that there will be a large turnout of members and friends interested in the club. A photograph will be taken before starting.

Hampstead C. and M.C.

The opening run is fixed for Saturday next, the 11th inst., to the Red Lion Hotel, High Barnet. Tea 5.30, concert 7.30 p.m., to which prospective members are cordially invited. Owners of passenger motor cycles would find this a suitable club to join, as ladies are admitted as members, and social events are arranged during the winter season. For further particulars apply to the hon. secretary, C. H. Cave, 3, High Street, Highgate, N.

Motor Cycling Club.

Mr. S. H. Fry has kindly consented to take charge of the organisation of the London-Edinburgh run. All communications respecting this event should be addressed to him at 5, Highbury Grove, N.

Members are requested to note that the competition for the Albert Brown Cup has been postponed from Saturday, May 16th, to Saturday, May 23rd.

The following new members have been elected: Messrs. W. H. Lane, Tom Pears, G. S. White, and J. Winston.

Birmingham M.C.C.

The Easter tour last year was such a great success that it has been decided to hold another this year. On Friday, the 17th inst., at 10 a.m., the start will be made from the Fountain, Hagley Road. Members will stay the night at Llanidloes, Saturday night at Llandrindod Wells, Sunday no fixed programme, Monday Monmouth and Tintern, Tuesday Birmingham. The expenses are estimated at from 30s. to £2. Members desiring to take part should notify Mr. R. W. Duke (captain), 18, Islington Row, Five Ways, Birmingham, by to-morrow, the 9th inst. The new headquarters at the Acorn Hotel, Temple Street, will be used more as a social centre than hitherto. Next Saturday's run is to Edgehill, leaving College Road at 2.30 p.m. Tea at the Round House. The membership of the club at date approaches one hundred.

Club News.—

St. Helens and District M.C.

The first annual dinner of the above club was held at the Fleece Hotel on Tuesday, March 31st. Mr. B. Brewis, B.A., LL.B., the president, occupied the chair, and was supported by Councillors Rudd and Brown, Messrs. Milne, Chorley, McCullock, and Cook. In proposing "The Club," Mr. Brewis made a strong appeal to all local motor cyclists to join the club, and thus become affiliated to the A.C.U. Out of seventy-seven motor cycles registered in the town, he thought a club of much greater numbers ought to be in existence. Councillor Rudd replied. An enjoyable musical programme was gone through.

Members are reminded that the run to Llandudno takes place on April 19th, the return journey being *viâ* Llangollen and Chester. All riders in the district are invited to join in this run.

Western District M.C. (London).

At a meeting of the above club on the 4th inst. it was finally agreed to affiliate to the A.C.U. All motor cyclists in the West of London not already members should join at once and obtain the advantages which affiliation affords. Entrance, 2s. 6d.; subscription, 7s. 6d. Prospective members can obtain full information from the hon. sec., R. R. Babbage, 16, Rigault Road, Fulham, S.W., or, if more convenient, can write or call to any of the following members who represent the club in their particular district: Ealing—Mr. W. Prosser, 73, Loveday Road; Mortlake—Mr. A. R. Canham, Sheen Lane; Chiswick—Mr. C. Gould, 10, High Road; Hounslow—Mr. T. Williams, The Milford Hotel; and Feltham and district—Mr. H. Edwards, 10, Camden Avenue. Several members of the club wishing to attend the races at Brooklands on Saturday and Monday, the 18th and 20th inst., an impromptu run will be held on those dates. Meet at the Milford Hotel, 10 a.m.

Members are requested not to forget the smoking concert at the Milford Hotel to-morrow (Thursday) at 8 p.m. Some of the best talent in the Western district has been secured for this event.

Next competition, April 12th. Speed-judging contest, Henley and back.

Motor Cycle Union of Ireland (Dublin Centre).

An ordinary general meeting of the above was held in Wynne's Hotel, Abbey Street, on March 23rd, Mr. C. B. Franklin (vice-president) in the chair.

A motion was proposed to affiliate the Dublin and District Motor Cycle Club, and it was unanimously decided to do so.

A good deal of discussion then took place as to the different schemes proposed to classify the different machines of various horse-power and weight for the speed trials at Portmarnock, so as to assist the handicappers in securing better and closer racing. It was decided not to fix any hard and fast rule that would debar any machine from competing in all the events, but rather to trust in the handicapping committee entirely to procure close finishes, though it was realised how difficult a matter it is to fix a fair handicap for a 2 h.p. machine three years old and an up-to-date 6 h.p. twin. In order to help the handicapping committee, it was decided to start a competitors' register, and each rider in the different events will have to register his machine at least three days before the event in which he intends to compete, giving full particulars of machine, viz., make of engine, number of engine, bore and stroke, make of machine, also total weight of machine complete without petrol or oil. Any competitor whose machine is found not to agree with the specification under which he enters will be liable to suspension, but an allowance in the weight of his machine of 5 lbs. either above or below weight registered will not disqualify.

Intending competitors are requested to send in the above particulars of their machines to Mr. J. A. Armstrong, hon. secretary, 34, Oakley Road, Rathmines, Dublin, as soon as convenient, and any alteration any competitor may make to the machine during the year affecting any of these particulars must be notified to the hon. secretary. No charge will be made for registering machines.

The opening hill-climb will take place on April 25th. It is proposed to hold a supper at Wynne's Hotel, Abbey Street, on the same date as the hill-climb, at 7.30 p.m., provided sufficient support is received, and all who hope to be present are requested to forward their names to the hon. secretary without delay. Tickets will not exceed 2s., and members' friends are invited.

Southern Counties M.C.C.

It has been decided to hold an invitation run to Limpsfie on Saturday next, starting from the Crystal Palace Para at 3 p.m.; also to Horsham on the 12th inst. The start w be from Purley Corner at 11 a.m.; lunch at the Black Hor

Stockport and District M.C.C.

The above club was successfully formed last week Stockport, with headquarters at the Musey Hotel; t annual subscription is 10s. The following officials have be elected: President, Mr. W. Slater; vice-presidents, Messrs. Gibbons, jun., A. Mugeli, T. Smith, and J. Woodrow; ho treasurer, R. Rogers; hon. secretary, H. Marsden; co mittee, F. Briggs, F. Allen, T. Chadwick, W. C. Norma J. S. Davies, and E. K. Lund.

On Saturday, April 11th, the opening run will take place Knutsford, starting from headquarters at 2.30 p.m. On t 12th inst., to Chester, leaving headquarters at 11 a.m.

Any motor cyclists wishing to join will be made we welcome, and should make application to the hon. secretar George's Road Coal Depot, Stockport.

The North-west London M.C.C.

We are in receipt of the rules governing the North-we London Motor Cycle Club's reliability run from London Coventry and back. The following is a digest of these reg lations: The machines must be standard touring machin subject to the approval of the judges and conforming to t usual definition of touring motor bicycles. Cutouts, fitted, must not be used. [We suggest here that they l sealed so that all possibility of their being used is eliminate —Ed.] To all competitors who complete the journey with the stated schedule time a silver cup will be awarded. Th route will be *viâ* Watford, Berkhampstead, Bicester, Enston Shipston, Ettington, Warwick, Kenilworth, and Coventr The start will take place from Jack Straw's Castle, Ham stead Heath, at 7 a.m., on May 23rd; minimum time fro London to Coventry will be 5h. 25m.; maximum time is 6 There will be checking stations along the route, and there wi be a control at Coventry. The competitors may effe repairs, but these must be done during their runnin tim and they must receive no outside assistance. For entr forms and fuller particulars application should be made t Mr. A. Stanley Phillips, 84, Alexandra Road, South Ham stead, N.W. The trial bids fair to be a success.

The opening runs to Tring on the 4th and 5th inst. we somewhat spoilt owing to the wet weather.

AUTO CYCLE UNION NOTES.

Brooklands Motor Cycle Race.

It has been decided by the A.C.U. to recommend to th Brooklands A.R.C. that the motor cycle race on Saturday the 18th inst., should be a handicap.

Officers and Committee.

The following elections have been made: Chairman, Mr Robert Todd; vice-chairmen, Messrs. J. Lyons-Sampson, C A. Smith, S. F. Bevor, and V. Hart; hon. treasurer, C. A Smith. The various committees will be composed as follows Competitions, Messrs. E. J. Bass, E. M. P. Boileau, B. R Chatterton, A. G. Reynolds, H. P. E. Harding, J. Lyons Sampson, A. Sharp, W. Pratt, W. H. Wells, and J. Hardy finance, H. G. Cove, J. Hardy, H. B. Renner, and E. Nelson legislative, G. F. Sharpe (*ex-officio*), V. Hart (*ex-officio*), R Todd (*ex-officio*), H. G. Cove, W. Pratt, H. P. E. Harding. E. J. Bass, J. Hardy, and B. R. Chatterton.

Permits.

Permits have been granted, provided that no practising is allowed before the events, to the Hertfordshire County A.C. to hold an open hill-climb on April 25th, and the Essex Motor Club to hold a hill-climb on May 9th. A permit has also been granted to the St. Albans Athletic Association to hold motor cycle races on Whitsun Bank Holiday.

An error occurred in our advertisement pages on the 25th ult., relating to the competition organised by Leo Ripault and Co., 64a, Poland Street, and 13a, Broad Street, W. The mistake was the printing of the letters "E.C." after the words Broad Street. Will any intending competitor who has had his letter returned by the Post Office officials readdress it to Broad Street, W.

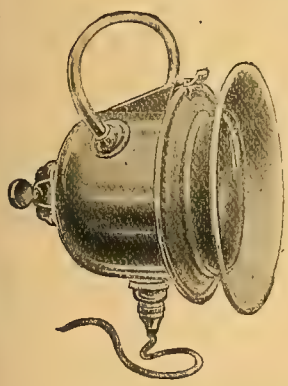
WHAT IS THE USE OF SHOVING



an electric bulb into a tin case with a glass front, and calling it an electric Head Lamp? In the **"ELECTARY" MOTOR CYCLE HEAD LAMP**, a properly constructed lens and reflector project an intensely powerful light ahead. At the recent Cordingley's Motor Show, this lamp was frequently mistaken for an Acetylene Search Light, so intense were the rays emitted. This lamp makes Electric Lighting on a motor cycle practicable.

PRICE, in Polished Brass or Nickel-plate, including Osram Bulb **17/6** each.

Special **8 volt** Accumulator in tin lined leather case (8-9 hours light) **£1 13 6**

Special **4 volt** ,, ,, ,, ,, ,, (10-12 ,, ,,) **£1 1 6**

Our 1908 **"ELECTARY" CATALOGUE** deals with the above and also with our Electric Tricar Side Lamps, at **35/-** per pair, including Osram Bulbs. Also

The "ELECTARY" Accumulators, 2, 4, 6, and 8 Volt, from 7/- each.
,, "ELECTARY" Magneto Handle-bar Switch, 4/6 each.
,, "ELECTARY" Accumulator Handle-bar Switch, 4/6 each.
,, "ELECTARY" 2-way Belt Punch, cuts either end of belt, 3/3 each.
,, "ELECTARY" Charging Board, complete with Ammeter, 15/- ,,

A NECESSITY When on Tour.

The Autocar FOLDING MAP for Motorists

(In Strong Case).

When on tour the automobilist is often faced with the question or which road to take or the best way to reach a certain place. All such difficulties can be overcome by carrying "The Autocar" Folding Map in your kit. It occupies very little space, as when folded it measures only 7½in. × 9½in. All main roads are marked in red, and the distances between all important towns are given.

PRICE 8/10, Carriage Paid.

OBTAINABLE FROM

The Offices of "The Motor Cycle," 20 Tudor Street, London, E.C.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Lightweights and the End-to-end.

3224.]—I have just read a paragraph in last week's issue *The Motor Cycle* by "Ixion" with reference to lightghts in the End-to-end trials. I may mention that it is intention to ride a Douglas 2¾ h.p. twin motor lightght in the Land's End to John-o'-Groat's trial, but I am in favour of having the A.C.U. rules amended. If the ıtweight machine is to hold its own, it must do the same the heavyweight 3 h.p. and 3½ h.p. machines are doing, erwise the public will not look at it.

W. WILSON DOUGLAS.

The Balancing of Petrol Engines.

3225.]—I am considerably surprised that a designer at of the leading motor firms [No. 3188] should have written t he thinks that the vibration in a Quadrant engine is re due to the high compression than to incorrect balancing parts. Might I suggest that he should look up Newton's cisely expressed "Third Law of Motion," which says that ction and reaction are equal and opposite." That is, atever pressure you have in a cylinder due to a gas, or other substance, the piston exerts the same force against gas as the gas exerts against the piston. The same is of the cylinder head. So it comes to this, that the rnal forces in an engine have nothing whatever to do h the balancing of that engine.

R. N. PARRY.

3226.]—I have read with much interest the discussion on "Balancing of Petrol Engines," and would like to add my erience.

am the owner of a 1908 Triumph, and find that if I pt the law laid down, that the weight of the piston, conting rod, etc., should be counter-balanced by weights on flywheels, I have an engine that ought to be a perfect htmare for vibration; but the curious part is that there no vibration at any speed—in fact, I am certain there is a sweeter running machine on the road.

As for the gentleman who in letter No. 3189 states that, r balancing some nameless engine to conform with the ve law, he beat a 3½ h.p. Triumph on a hilly road, I can y say that the Triumph must have been very badly out tune. "Shazbazzik," I notice, owns a 1908 Triumph, ich, like mine, is very much out of balance, but he says hing of the actual behaviour of the engine.

Again, I would like to say a word on the question of "alber non-skid tyres." How is it that no one mentions the mer Cord? I have ridden a pair of these all through the ıter, over snow and the most abominably greasy roads ıginable, and have never experienced the slightest suspicion side-slip. It seems a great pity that so much is said to advantage of foreign products when we have such an ellent article made at home, and as for the wearing quali- of Palmers, I am assured there is no other tyre that can t them in that respect.

n conclusion, allow me to say that I am not in any way erested in either of the firms mentioned further than being horoughly satisfied customer.

ALEX. B. McDONALD.

The A.C.U. Council Meeting.

3227.]—The reference in your leading article to the ection of the proposition for a scheme for unattached riders ses a matter which I believe to be of great importance to A.C.U. No doubt you refer to a resolution moved by Mr. Hall, and which I seconded. But I think that your conjecture that it was thrown out by the provincial delegates is hardly correct. I think the private members of the A.C.U. and the R.A.C. representatives were "solid" against it, probably for financial reasons. My own belief is that some such proposal as Mr. Hall's is the only way to gain the support of a large number of motor cyclists who have no use of any kind for a club. The men I have in mind are undivided in action as far as the pastime of motor cycling is concerned. They do not want the *R.A.C. Journal*, probably they read *The Motor Cycle*; they have little interest in club or inter-club competitions, or reliability, or penalty runs, and still less do they desire to take part in dusty club runs. All they require is the personal satisfaction of being constituents of the leading organisation, and the moral support in difficulty of being members of a large and respectable and well organised authority. If the A.C.U. will not cater for these people other bodies may do so, and I enclose you a cutting from this month's *C.T.C. Gazette* bearing upon the point.

To my mind, the weakness of the A.C.U. as it now stands is that apparently it does not want to be a representative body, but only a governing body.

S. HERBERT FRY.

The paragraph referred to published in the *C.T.C. Gazette* April, 1908:

> To Motor Cyclists.
>
> It will be noticed that a Motor Cycle Committee has been formed, and the chairman finds it rather difficult to get into touch with the motor cyclists, and would, in consequence, be glad to receive communications from motor cyclists, and any suggestions for furthering the interests of motor cyclists in particular and the Club in general will be welcomed by him.
>
> B. P. S. Rooke, Major (Chairman).
>
> Highfield, Heene Road, Worthing.

Chain v. Belt.

[3228.]—Mr. Davies's article in the last issue of *The Motor Cycle* gives the impression that a chain is more dangerous than a belt. We have now been manufacturing chain-driven motor cycles for over seven years, and have never known a single instance of an accident happening through a broken chain. The chief reason why chain drive is not more common is that a machine is more expensive to manufacture for chain than for belt drive, and the ordinary method of fixing the engine in the frame does not hold it sufficiently rigid to maintain a true chain line. A chain, although it costs no more than a good belt, will easily outwear two belts, will not stretch unduly or slip, requires practically no attention, and is unaffected by the weather.

We think that the performances of the P. and M. in open competition have proved that on a properly-designed machine nothing can beat a chain drive for all-round efficiency, but in justice to the riders of our machines we cannot allow a statement from such an authority as Mr. Davies—"To-day, when the belt drive is perfected, the chain is practically dead"—to go unchallenged, as we have now three times as many orders in hand as we have ever had before, and we do not know of a single one of the riders of our machines who would willingly go back to the belt.

PHELON AND MOORE, LTD.

[Mr. Davies also wrote: "It survives on a few machines, and those makers who have stuck to it during the last five or six years turn out thoroughly satisfactory examples of it."—Ed.]

Does an Air-cooled Engine Overheat?

[3229.]—It is to be feared that Mr. Walford does not always practise what he preaches, or, if he does, the results are disappointing. On the occasion of a recent opening club run it was rumoured that he had been seen to empty the water out of his radiator and fill up with cold. Why, why? But, really, I cannot agree that the charge is equally heated in a water-cooled and air-cooled engine, and Mr. Walford's remarks about temperature are surely rather quibbling.

No one advocates a cold engine, and Mr. Edge's 150° Fahr. is probably about right; but 150° Fahr. is not red, or even "pink" heat. It is a matter of degree. Most carburetters have a water jacket or hot air intake; if not, they get warm air from inside the bonnet, which comes to the same thing; the air must be warmed or the carburetter will freeze up, hence I maintain that the heating of the carburetter does affect the case. Also air is very easily heated. Consider how it abstracts the heat from the radiator while passing through it at high speed. R. B. VERNEY.

[We would prefer correspondents to adhere more closely to experiences with motor cycle engines when possible.—ED.]

[3230.]—I read your paper *The Motor Cycle*, and am interested in the correspondence and articles therein on the question of overheating of motor cycle engines. To my mind it is all a question of lubrication. At any rate, that is my experience. We ride our machines here when the shade temperature is from 90° to 110°—for a week this summer we had an average of 111°—and do not suffer from the inconveniences of overheating which some of your contributors experience. Not that our engines do not get hot—mine got so hot one day as to burn a hole in the right leg of my trousers—but we give them sufficient oil to counteract the great heat. It is only commonsense that a piece of machinery running at the great speed of a motor cycle engine requires to be liberally lubricated, apart from the heat generated in the cylinder by the combustion. I ride a 3½ h.p. Triumph machine, 1907 pattern. The maker's catalogue instructs, "Give one charge of oil every twenty-five miles in winter, and every twenty miles in summer." If I ran my machine on those lines I should have a ruined engine first trip. My experience is, a charge of oil not less than every five miles, or half a charge every two or three miles is better still, and if the machine be a new one, the engine should have a charge of oil about every three miles for the first 100 miles or so. Overheating and consequent knocking, in my opinion, is only the engine calling for lubricant, and much harm cannot be done if a little too much oil be given. Of the two evils, too much oil is considerably less than too little. After a run our engines literally sweat oil from the radiating fins down, and I think it helps the cooling. When a man is hot he drinks and sweats, and the air cools him; so with an internal combustion engine. This is our theory and practice here, where our summer temperature is higher—and is a dry heat as well—than in England. I hope some of the English "overheaters" will try the plan and report result through your columns for the benefit of others. In conclusion, allow me to express the pleasure and benefits I derive from reading your paper. W. J. THOMPSON.

New South Wales.

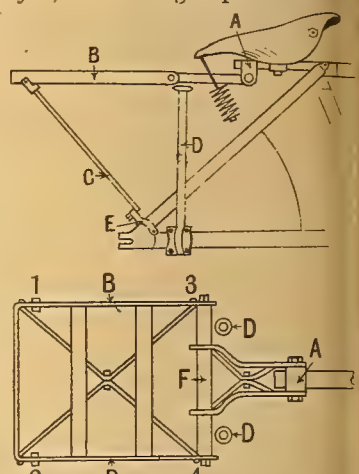
[3231.]—Last week I was riding a 3⅜ h.p. Rex (1907) and towing a friend on a push cycle. We had been averaging twenty-five miles per hour for about six miles, and when ascending a fairly steep hill my friend drew attention to the space between the two valve caps, which was distinctly red hot. Shortly after my friend cast loose as the gradient was too stiff for both of us (even with engine cold), and beyond a stroke or two of the pedals to pick up speed again the machine went on up the hill all right. I have never before seen any engine emitting so decidedly a luminous heat (quite visible although it was not within a quarter of an hour of lighting up time), and have indeed rather scoffed at its possibility. The point, however, I wish to emphasise is this. If an engine can pull when so hot as this (certainly far hotter than ninety-nine per cent. of so-called overheating cases) it shows that the question is not probably one of overheating, but a combination of other circumstances which as far as I remember was Mr. Walford's main conclusion.

Having been away for some time I had not seen Mr. Verney's remarks *re* my criticism of his use of Boyle's Law. As this law expressly postulates a constant temperature during its volume pressure changes, and as the question in "overheating" is, how far do temperature changes have an influence on the volume sucked into the cylinder, I must emphatically say "It is not clear" to me what his remarks mean. H. M.

["H.M.'s" letter was unavoidably held over. Mr. Verney replied to "H.M." in the issue of February 19th, letter No. 3127.—ED.]

Luggage Carriers.

[3232.]—Having noticed the recent remarks on luggage carriers in *The Motor Cycle*, and having experienced difficulty myself in obtaining one from the market to suit my particular requirements, I thought you would be interested to hear my solution of the difficulty.



Luggage carrier is detachable by undoing nuts 1, 2, 3, 4, the cross-bar F. and extension piece are then left *in situ*

A. Clip.
B. Flat metal 1in. by ¼in.
C. Tubular stay.
D. Legs of Simplex stand.
E. Chater Lea clip.
F. Cross tube brazed to extension piece.

The carrier illustrated and described in the issue for Feb. 19th is an exceedingly neat and efficient one, but does it fit those machines which have a horizontal seat-pillar instead of a vertical one? In fact, I found that the position of my saddle was the greatest obstacle to obtaining a good point of attachment. Moreover, I had to dodge the legs of the Simplex stand, and also not interfere with the springs of the Brooks B 105 saddle.

The clips on the back stays are what Chater Lea supply for tradesmen's front carriers; the stays are of tubing with neat yoke end at the top. The top may, of course, be mad of tubing, but I found flat metal easier to work and just a strong. I can stand on my carrier, or use it for lifting th whole machine, sidecar and all. There is no lateral play c account of the cross girder struts. It is at once detachab by undoing three nuts.

I shall be pleased to supply any further details, if required to readers who, on account of the construction of the fram find difficulty in adopting an ordinary carrier.

It may be interesting to add, I also have a luggage-carri over the front wheel.

B. RICHARDSON BILLINGS.

Unattached Riders.

[3233.]—In reply to "I.H.S.," I represent a club whic has at least applied for affiliation. I do not consider it at a necessary for affiliation advantages to be fixed at so nomin a figure as 3s. 6d., and to be applied to unattached riders in fact, it would be distinctly hard on small local clubs wer that the case. "I.H.S." may be quite right when he sug gests that ordinary subscriptions of a local club may be t high, or "the social and sporting side" not as he desires but why should he not obtain affiliation through some othe body whose subscriptions are moderate? An exact parallel t the latter objection came before my notice quite recently when an ex-member of my club applied for readmission, a he desired affiliation benefits, the club in his locality bein undesirable, although living over fifty miles from here practi cally prevented all other club benefits. And I consider quite permissible for a club to admit members, even thoug they live at a great distance from the club, for the purpos of extending to them affiliation privileges at a reasonable rat Perhaps "I.H.S." would care to communicate with me. should be pleased to send him a prospectus of my club.

R. K. HUBBARD,
Hon. sec. Basingstoke and D.M.C.

The A.C.U. and Irish and Scottish Motor Cyclists.

[3234.]—There seems to be some little misconception as to what was really done at the A.C.U. Council meeting respecting the above. It was decided to ask the Scottish Cyclists' Union, who govern motor cycling sport in Scotland, to hand over the reins to the A.C.U., so that the clubs and riders there could join the A.C.U., while retaining "home rule" of local matters. So with Ireland. At present the sport in Scotland is in the hands of a pedal cycle organisation. My information, secured when arranging for the Conference at Lincoln, is that the Scottish and Irish clubs desire to join a purely motor cycling organisation, and the proposal by Mr. Hall at the Council meeting, which I seconded, was simply to endeavour to remove the present obstructions to the riders of the two countries joining the A.C.U. The A.C.U. has now sole control over motor cycling in this country, and as it is the only organisation dealing solely with motor cycling, and entirely independent of motor car organisations except as to sport, those of us who have considered the matter really believe that if the whole of the riders of the kingdom were banded together into the A.C.U. we should be all the stronger. We therefore have made some endeavour to make that possible. The Scottish and Irish riders added to the A.C.U. would strengthen us, and we believe they would be better off. The centre scheme, to be put into operation, will give the two countries full control over their own local affairs, and altogether it seems an opportune time to start the negotiations.

G. J. WILKINSON,
Hon. sec. Lincolnshire M.C.C.

Motor Cycle Taxation.

[3235.]—As an occasional reader of your paper, I have not noticed that any great effort has been made on behalf of motor cyclists to obtain proper representation on the Royal Commission which has just sat, or to obtain for them that proper adjustment of taxation in the new legislation, which will no doubt come within the next few months.

The efforts of a collective body of motor cyclists are what is wanted, or the trade will be injured, and motor cyclists will be dropped on for extra taxes, which are now out of all proportion to large cars, on the score of original cost, horse-power, or damage done to roads.

If any body does represent motor cyclists as distinct from motor carists, I think the following is a good suggestion for it to bear in mind. Numbers of motor cyclists (like myself and several friends) only use their machines during half the year, and if the Revenue tax is increased it would be a great boon if it were issued half-yearly, taken from, say, April 1st to September 31st, or from any one date for six months, as the £1 and £2 game licenses are now issued. Then even if an increase of taxation were made, it would not be felt so much. It certainly is hard to tax a motor bicycle from January 1st, when one may not have ridden it this year yet, and will probably only wish to ride it on fine week-ends during the summer, which works out under the present taxation at the rate of about 1s. a ride.

I hope this will catch the eye of the motor cycle organisation.

FC 91.

Tyres on Heavyweights.

[3236.]—Having been a motor cyclist in Tasmania for two years, with considerable experience of colonial roads, I am writing to you in the hope that you will be able in the columns of your widely read paper to direct the attention of the manufacturers to the necessity of making far stronger tyres for motor cycles of high power. I am the owner of a 6 h.p. Bat, which has given me very great satisfaction in every respect, except in the matter of tyres. It was fitted with —— (26 × 2¼), and the back tyre wore through to the canvas in less than 500 miles. A friend of mine here has a 5 h.p. Vindec, and his —— steel-studded tyre came to the same untimely end after running about 1,200 miles. Our roads are very rough indeed, and require much heavier tyres than the English roads, on which I used to ride for many years. Would it not be possible for manufacturers to make a small car tyre to fit motor cycle rims (26 × 2½) at a cost of £2 10s. or £3? I am quite sure such tyres would be eagerly bought by owners of powerful motor cycles, as such tyres would be far more economical in the long run. The continual tyre troubles we experience out here and read of even on good English roads do a great deal to discourage possible purchasers of motor cycles, and in Australia the original expense of such machines is so much greater than in England, that it is not surprising that people hesitate to purchase a machine which may entail much trouble and expense in its upkeep. Motor cycling is such a delightful recreation, even on our poor roads, that it is a pity any prejudice against it should be caused by a matter which could so easily be eliminated. I hope you will use your influence in giving this point considerable prominence in your paper, as by so doing you will be conferring a great favour on motor cyclists in the colonies.

E. T. GOWER.

[We should like to point out that recently tyre manufacturers have paid a great deal more attention to the making of substantial motor cycle tyres for powerful machines. It is also possible to fit 650 × 65 (26in. × 2½in.) voiturette tyres to certain machines.—ED.]

The Price of Spirit.

[3237.]—I read an article in the London *Daily Telegraph* of March 14th relating to the Thames Conservancy Board's restrictions upon the discharging of motor spirit, and it appears to me that these restrictions are totally unnecessary, considering that, by this time, those who have handled petrol, are fully aware of its inflammable nature.

The general assumption is that the high price of petrol is due to the fact that the importers have a sort of corner, and will not retail to the consumer at a reasonable price, but go in for big dividends, and this keeps the price high.

However, after reading the paragraph mentioned, I have come to the conclusion that it is not the importers who maintain the high price of petrol, but the aforementioned restrictions. The light thrown upon the position by the *Daily Telegraph* is of great importance to owners of motor cycles and cars, and each of us should make it his business to enquire into and remove if possible any unnecessary restrictions that hinder the industry.

Perhaps there are some of your readers who are more familiar with the Thames Conservancy Board's method of dealing with goods of undoubtedly a dangerous nature, and they would be willing to give some valuable information upon this very important question.

FRANK CREALY.

Two-speed Gears and Free Engine Clutches.

[3238.]—Referring to the question of two-speed gear machines, up to the present these have failed to prove their reliability in long-distance work with one exception, which has the disadvantage of being a chain driven machine with a type of engine and frame at variance with the popular and well grounded ideas of the present day. When we see well-known makers who market two-speed gear machines carefully abstaining from entering them in long distance trials, one must come to the conclusion that for reliability they have a long way to go yet. Of course, if chain drive for single machines could for a moment be compared to belt drive, the problem could be regarded as solved by the well-known Phelon and Moore gear.

Further than this, the efficiency of such belt-driven gears as have appeared seems to be a long way from being satisfactory. It really seems that the best way out of the difficulty for single machines will be some form of variable pulley operated from the saddle, with perhaps a clutch in the back wheel and sufficient engine power to do anything with, say, a 6½ to 1 gear, which is about the lowest we can risk with direct belt drive and that power of engine.

This will necessitate some means of tensioning the belt other than the impossible jockey pulley. We want two-speed gears, but without loading up single cylinder machines until they are as heavy as the twin-cylinders, and without diminishing their speed on hills and on the level by a factor which varies according to the condition of the gear and its correctness of design.

But in any case, before these devices catch on we must see makers entering fleets of such machines in long-distance trials, and gaining as many gold medals as their less complicated sisters. And we must see them also able to take their part in purely speed hill-climbs, thereby demonstrating that the two-speed gear has not interfered seriously with the amount of power reaching the road wheels. All of which things are afar off, I fancy. In the meantime, we must be content with the variable speed pulley.

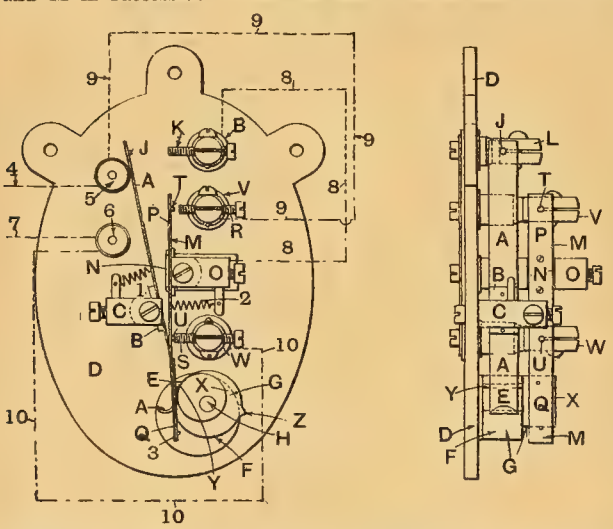
H.

RECENT PATENTS.

By ERIC W. WALFORD, F.C.I.P.A.

The R.O.M. Contact Breaker.

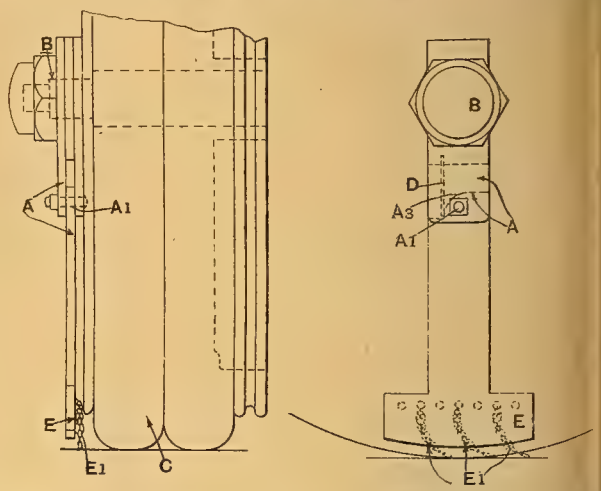
THIS is the invention of Mr. R. O. Mitchell, and is being marketed by the Continental Motor Co., of 32, Rosebery Avenue, London, E.C. The following is a description of the contact breaker as applied to a two-cylinder engine: One blade A, which is the ordinary blade, is hinged at an intermediate point B on a standard C secured to a brass plate D, which is adapted to be secured in place and to receive a cover in the ordinary way. This blade A engages at the end E with one face F of a cam G mounted on the usual shaft H, and it is furnished at one end with a platinum point J to co-act with a platinum-tipped contact screw K, supported in an insulated terminal L secured on the base plate D. This mode of pivoting the blade A ensures rapid and certain firing due to the leverage of the end carrying the joint J. The other blade M is pivoted at an intermediate point in its length at N on an insulated standard O fixed to the base plate D, so that two arms P and Q are obtained. The upper arm P co-acts with a contact screw R, and so does the lower arm Q with another contact screw S, for which purpose, respectively, the arms P and Q are provided with platinum points T and U, and the contact screws R and S are platinum-tipped and are supported in insulated terminals V and W, both fastened to the base plate D, all in the same fashion as the corresponding parts J, K, and L of the blade A. The end of the arm Q co-operates with another face X on the aforesaid cam G. The faces F and X of the cam G are proportioned to correspond with the angles of the engine cranks and to operate the respective blades A and M in succession. Thus the face F takes the form of a



cam proper, with two projections Y and Z set at the proper angle apart, whilst the face X is fashioned as an eccentric. The blades A and M are held in contact with the cam G by springs 1 and 2 secured to them and to the standards C and O, whilst the blade M is insulated from the cam G by a fibre or other suitable block 3 secured to it. The wire 4 for one cylinder (say the back) is connected to an insulated terminal 5 on the base plate D, which plate also carries a terminal 6, to which the wire 7 for the other cylinder is connected. The terminal L and the standard O, the two terminals V and 5, and the two terminals W and 6 are electrically connected by strips 8, 9, and 10 respectively, represented by broken lines. Therefore, when the cam G is revolving, the blades A and M are alternately actuated to engage and disengage their contact screws K and R and S, and so make and break the electric circuit, thereby producing the ignition in the cylinders synchronously; that is to say, the blade A is actuated by the cam face F with the points Y and Z to make and break contact by its joint J and screw K twice every revolution, whilst the blade M, through the influence of the cam face or eccentric X, alternately makes and breaks contact at its points T and U and corresponding screws R and S, and in this way the current is switched to the proper cylinder by the blade M.

A Chain Non-skid.

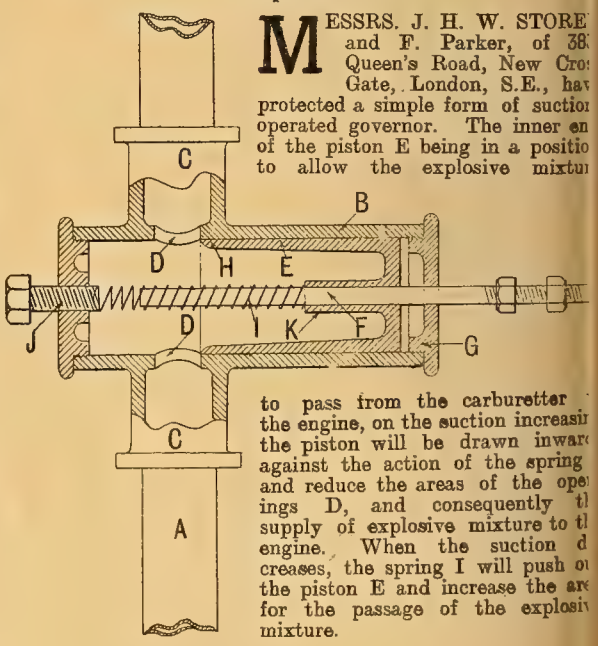
MR. H. HARRIS, of 59, Vale Road, Finsbury Park, London, N., is the inventor of this device. A vertical bar A jointed as at A^1 depends from the axle B of the wheel C to within a short distance of the ground, a spring D being arranged between the two parts of the bar A in order to render them practically a flexible bar capable of bending rearwardly. The bar A carries at its lower extremity a cross member E, from which chains E^1 are suspended, and these chains are of such a length as to trail upon the ground so that in the event of the vehicle tending to skid or side-slip the wheel or tyre comes into contact with



the chains, which arrest further progress, the said chain working under the tread of the tyre. It is preferred that the links increase in size from the free extremities of the chain so that the latter act in the capacity of wedges. As the operation takes place the bar A will gradually bend rearwardly, and as soon as the chains E^1 again clear the wheel or tyre the spring D will return the parts to their normal positions by bearing upon the curved or cam part A^3 at the upper extremity of the lower portion of the rod A.

A Simple Governor.

MESSRS. J. H. W. STORER and F. Parker, of 38 Queen's Road, New Cross Gate, London, S.E., have protected a simple form of suction operated governor. The inner end of the piston E being in a position to allow the explosive mixture



to pass from the carburetter to the engine, on the suction increasing the piston will be drawn inwards against the action of the spring and reduce the areas of the openings D, and consequently the supply of explosive mixture to the engine. When the suction decreases, the spring I will push out the piston E and increase the area for the passage of the explosive mixture.

MOTOR BICYCLES FOR SALE.

VINDEC Special Motors from Stock.—Woodman's, Peterborough.

5 h.p. Twin Rex, spring forks, spring seat-pillar, in grand order; £18.

3 h.p. Clarendon, new tyre on back wheel, new belt, new coil; £14.—Balmforth, Motor Engineer, Ormskirk.

£6 10s.—Rex, 3½ h.p., spray, good order, —Element, Eardisley, Hereford.

ANGLIAN Motor Cycles, with simplest and most practical two-speed gear.—Below.

DOUGLAS Twin Motor Cycles, the marvellous lightweight; also

SIDECARS (Mills-Fulford castor wheel), and a special selection of second-hand bicycles and tricars can be seen and tried at the London agents, H. P. Rose, Ltd., 28, Frith Street, Shaftesbury Avenue, W.

1907 3½ h.p. Triumph, magneto ignition, excellent condition; £32, or near offer.—Below.

3½ h.p. Motor Bicycle, Minerva engine, low frame, long bars, and back position, just built; £30.—Below.

2¾ h.p. Hulbert-Bramley, Minerva engine, excellent condition; must be sold; £15.—Below.

1905 3½ h.p. Rex, accumulators, ignition, good working order; what offers?—Below.

2¾ h.p. Motor Bicycle, Brown engine, low frame, new, just built; bargain, £25.—Below.

2 h.p. Phœnix, in good working order; £8.—The Hulbert-Bramley Motor Company, 96, Upper Richmond Road, Putney.

2 h.p. Minerva, tyres as new; £8, offers. —Particulars, Coulson, Barnburgh, Doncaster.

£5.—2¾ h.p. Werner, wants re-assembling; bargain. — Roberts, 7, Albany Road, Wimbledon.

TRIUMPH, late 1907 model, guaranteed perfect throughout; £32; approval. —Parker, Melbourne, Derby.

4 h.p. Antoine Cycle, splendid condition; an honest bargain at an honest price, £20.—Particulars, Sanders, Buxton.

TRIUMPHS, 1908 models in stock; liberal allowances for second-hand machines, any make.—Parker, Melbourne, Derby.

3½ h.p. Clarendon, good running order; price £10, or near offer.—Stanbury, Willowhayne, Worcester Park, Surrey.

FOR Sale, 3½ h.p. Quadrant, 1907 pattern, like new, everything perfect; £20.—Goulden, Clarendon, Canterbury.

2¾ h.p. Clyde, splendid order, horn, tools, lamp (separate generator); £10.—Clark, George Street, Ryde, Isle of Wight.

GENN'S Famous 2¾ h.p. Minerva, just overhauled; sacrifice; buying tricar; 15 guineas.—6, Vineyard Hill, Wimbledon.

TRIUMPH, 1906, little used, enamelling and plating perfect, climb Devonshire hills; £26. — Metherell, Newton Abbot.

5 h.p. Twin Rex, four-speed gear, footboards, Grose non-skid, perfect condition; trial; £24.—63, Overhill Road, East Dulwich.

LIVERPUDLIANS! — Call at 74, Bold Street, and see latest models of Triumph and Roc motors.—Hitchings are the sole agents.

TRIUMPH, 3½ h.p., 1907, magneto, spares, also tube, no worse than new; given up riding; £35.—No. 9,504, *The Motor Cycle* Offices, Coventry.

2¾ h.p. Minerva, Chater-Lea frame, long handle-bar, condition as new, good tyres; bargain, £11 11s. — Egbert Spearman, Bishop's Stortford.

9 h.p. Spring Frame Bat, gas headlight, electric light, spare tyres, tubes, and all other spares, etc., practically new; only reason for sale, bought car; will guarantee six months.—Apply, Box No. 9,539, *The Motor Cycle* Offices, Coventry.

BOOTH'S MOTOR EXCHANGE

for Fair Dealings.

New Sidecars for Old.

We can give instant delivery of all models Mills-Fulford Sidecars, Castor Wheel or Rigid. Your old sidecar or other goods taken in exchange. Special terms to cash buyers.

WANTED, Reliable Motor Cycle for cash, 1907 preferred; cheap.—Full particulars, 17, Cranmer Road, Brixton.

WANTED, good 2¾ h.p. engine, twin coil, and silencer; cheap for cash, or exchange; no rubbish.—A. Moyse, Kessingland.

WANTED, Ariel or similar attachment, for push and motor cycle. — Particulars, Trolley, 42, Leonard Road, Portsmouth.

WANTED, twin Peugeot engine, magneto ignition; also engineering and motor tools.—W.H., 41, Church Street, Camberwell, S.E.

WANTED, Modern Tricar, give No. 7 Remington typewriter, valuable cluster diamonds, stud-pin, cash.—D., 103, Denmark Road, Camberwell.

WANTED, 2 h.p. light low motor cycle, good running condition; state lowest for cash. — L2,042, *The Motor Cycle* Offices, 20, Tudor Street, E.C.

WANTED, 2¾ h.p. Minerva and cash for new Fafnir, 3½ h.p., Chater-Lea, Longuemare; cost £40.—Fielding, St. George's Square, Hebden Bridge.

WANTED, Triumph Motor Bicycle; would exchange 3½ h.p. tricar, two-speed, also 76 by 80 engine, unused.—H., 8, Herndon Road, Wandsworth.

WANTED, ¾in. Whittle, 1904 Rex ¾in. pulley, pair 28 by 2in. covers; cash, or exchange cream Pomeranian dog.—26, Caunce Street, Blackpool.

WANTED, 1907, 1906 F.N., 2¼-2½ h.p., magneto preferred, first-class going condition; state lowest.—D., 6, Victoria Grove West, Stoke, Newington, London.

WANTED, 2½ h.p. Minerva or Jap inclined engine, to clamp on, complete with carburetter and exhaust, new or almost.—Lowest for cash to No. 9,605, *The Motor Cycle* Offices, Coventry.

1908, or late 1907 motor bike wanted, not under 3½ h.p., Triumph preferred, exchange brand new 55 guinea upright grand piano; seen and tried any time.—Motorist, 6, St. Agnas Place, Kennington, S.E.

WANTED, motor cycle, lightweight preferred, or 3 to 4 h.p., two-speed gear, and clutch, low frame, must be in perfect running order, with guarantee, either new or second-hand.—9,606, *The Motor Cycle* Offices, Coventry.

WANTED, for cash, tricar or trike, must be water-cooled engine, of good make, powerful, and bear expert examination, within easy distance of address; state lowest price.—Apply, or address, Tricar, 17, Knightsbridge, S.W.

MISCELLANEOUS.

THE Best Silencer made is Aldington's patent Silent, from 10s. 6d.—Below.

THE Ball Bearing Ideal Fan will cool any engine; 28s. 6d.—Below.

MY Footrests, reduced to 6s. 6d., are a luxury, spring rests, 17s. 6d.—Aldington, 59, Haydon's Park Road, Wimbledon.

G. T. RICHES & CO.,

19, STORE STREET, LONDON.

RICH DETACHABLE AIR TUBE,

Fitted with the new Protective Sleeve

26in. x 2¼in., 14/6; 26in. x 2½in., 15/6.

Your own tube converted. Please write for special list, with all prices for new tubes and prices for conversion, with instructions and hints. Our general accessory catalogue M free on application.

A SPORTING OFFER

As an inducement to test the new canvas and leather combination, I will send a SAMPLE BELT on the following terms: One half the amount with order, and the balance in three months from date of invoice, providing belt be perfectly satisfactory.

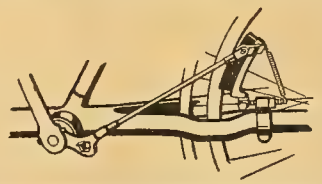
The CENTIPEDE BELT.

Full price of belt per foot—

⅜ 1/6, ½ 1 9, ⅝ 2/-, 1 2/3, 1½ 2/6.

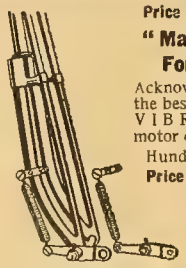
W. POLLIN, Belt Maker, **Spalding.**

'Chase' Driving Rim Brake.



The only Perfect MOTOR RIM BRAKE.

Price 16/6, by post 17/-.



"Matchless" Spring Fork Attachment.

Acknowledged by all to be the best. REMOVES ALL VIBRATION. Fit any motor cycle.

Hundreds of testimonials.

Price 15/6, by post 16/-.

Sole Manufacturers:

H. COLLIER & SONS,

HERBERT ROAD, PLUMSTEAD, S.E.

MISCELLANEOUS.

ONE Fafnir carburetter, suitable for 3 to 4 h.p. engine, new, 10s.; one Fafnir silencer, 4s., new; one handle-bar, complete with switch handle and wire, new, 5s.; one trembler coil, nearly new, 8s.—Smith, 60, Helena Road, Norwich.

MISCELLANEOUS.

WHITTLE'S Belt, ¾in., 8ft. 9in., goo condition; 13s.—27, Mattock Lan Ealing.

DYNAMO, 60 volt, as new, no to weight 70 lbs.; £10.—Wellesley Work Rake, Hants.

WHIPCORD Breeches, latest cut; 1 6d. — J. C. Savage, 119, Donegs Street, Belfast.

TANKS of all kinds made to order Doggett, metal worker, 65, Turnm Street, London.

3 h.p. Engine, carburetter, silencer, a coil, perfect, been taking sideca £3 19s. 6d.—Above.

TRY Our spring fork attachment, on 9s. 6d., complete, easily fitted; w pay more?—Above.

FROST-CRACKED Water Jacket!!! Don't swear!! We weld them patent process in a few hours. Send yo cylinder to-day; quotation on sight Alvaston Motor Works, Derby.

SHEDS for Motor Cycles, 45s.; po able.—Stevens, 82a, Leighton Ro Kentish Town, London.

COMPLETE Leather Motor Cycling S eight articles; 10s. — Roberts, bany Road, Wimbledon.

IRIDIUM Champion "Indestructibl Contacts; any part fitted, retur same day; 1s. 3d. each.

IRIDIUM Champion "Indestructibl Contacts; warranted pure; spe trimmers for polishing iridium, 9d.; filing required.

IRIDIUM Champion "Indestructib Contacts; hundreds in use. — V liams, 16, Wellington Street, Woolwic

VARIABLE Speed Pulleys, 8s., post fr belt fasteners. 9d. each.—Ta Wellington Square, Crewe.

FOR Sale, Eldorado V Belts, price, 9d.; ¾in., 10½d.; ⅞in., 1s.; 1in., 1s. 2 Pollin, belt maker, Spalding.

FAFNIR 1908 Carburetter, perfect; 1 exchanges entertained.—Sunnyb Leicester Road, New Barnet.

WHIPCORD Cycling Breeches, la cut; 10s. 6d.; write for patte —Booth, tailor, Longton, Staffs.

TWIN Engine, Antoine, 5 h.p., silenc coils, nearly new; £6 15s., lowe 18, Wellington Road, Smethwick.

ENGINES, air or water-cooled, 3, 6, 9 h.p.; write for particulars.— vance Motors, Ltd., Northampton.

MAYFAIR Accumulators, guarante 15 a.h., 10s. 6d.; 20 a.h., 15s.; 40 a 25s.—Fellows, Hertford Street, Mayfai

CHEAP Motor Cycle Houses; catalo sent free.—Portable Building C pany, Felsham Road, Putney, Lond

BROOKS Steel-studded non-skid cov 26 by 1½in., also Grose ditto, pra cally new; what offers?—Moss, Wen

YOUR New Mount is incomplete w out the Advance adjustable pull £1.—Advance Motor Mfg. Co., Ltd., No ampton.

DUST Screens, for tricars and side (registered); write for illustrati —Sole makers, Taylors', Motor Wo Edmonton.

EVERYTHING Made in cycle ta except a fortune. Write for pri —A. Phillips, 2, Strathnairn Street, mondsey.

IDEAL Motor Cyclists' Leggings for st comfort, and wear; finest sm hide; 6s. 6d. and 8s. 6d. pair.—Dar Boro, Farnham.

BRAND New 76 by 76 engine, carbu ter, tanks, and complete set o tings for 46 guinea machine; £6 15s.- High Road, Tottenham.

2¼ h.p. Engine, £4; 2¾ h.p. ditto, 3½ Bowden tricar hub, 26 by 2¼ cher, 15s.; twin car coil, 10s.—Horner Burley Road, Leeds.

MINERVA, twin-cylinder, 4½ h.p. gine, in perfect condition, £8 Phœnix two-speed gear, chain drive 10s.—Sloan, Boyle, Ireland.

The Affiliation Question.

FOR some time we have recommended the Auto Cycle Union to accept portions of clubs, instead of insisting upon the whole of the club becoming affiliated. We advocated this policy because we had in mind the question of mixed ...s, and knowing the motor cycle members in the ...ority of cases were desirous of being affiliated to A.C.U., irrespective of the wishes of the car ...bers. We are now pleased to say that the A.C.U. given us permission to state that mixed clubs ...ring to do so may sign separate affiliation agree...ts affiliating their motor cycle members only to the ...U. and their car members to the R.A.C.

The M.C.C. Inter-club Team Trial.

THE above event, which is down for decision on June 27th, we hope will receive more support from London and provincial clubs than was the case last year. A total of six motor cycle clubs out of approximately 100 in Great Britain and ...and is not a very large muster to compete for a fifty ...ea challenge cup. It should be borne in mind that ... event is of a most sporting nature; it does not ...end upon any one individual, but on a team ...ix riders representing each competing club. It is ...l at a week-end in a centrally situated spot, so that ...y club team can compete with a minimum of trouble ... inconvenience. Provincial clubs have frequently ...plained that all open competitions are confined to ... London district, so that the team competition of ... Motor Cycling Club removes this drawback, and ...excuse for a non-entry would not hold good in this case. The M.C.C. recognised that this might be a grievance, and chose a centre in the Midlands dating from the inauguration of the competition. Elsewhere we publish the rules for the 1908 competition, and hon. secretaries of clubs will be able to gather most of the particulars they require from these rules. In addition, Mr. J. Van Hooydonk, the assistant trials hon. secretary of the M.C.C., will be pleased to answer any enquiries or furnish any information. His address is Spring Villa, High Road, North Finchley, N.

Motor Cycle Finish.

A CONTRIBUTOR to *The Motor Cycle* recently said that the average motor cycle is possessed of far too many plated parts. Plated spokes, rims, hubs, cranks, and pipes, not to speak of bolts, nuts, and sundries, is simply a copy of the show bicycle; it looks nice, nothing better, but the cleaning! We wonder what the average car would look like after a few hundred miles on swamped roads if the above parts were nickel plated and left to the tender mercies of a not too energetic driver. The motor cyclist, however vigorous he may be, is not too fond of a two hours' back-bending cleaning operation after a day's ride, but it has to be tackled if the machine is to be even fairly presentable when it is next to be taken out.

If we could have our own way, we would have a machine painted a nice grey all over, with perhaps plated levers and handle-bar. It would not reflect the rays of the sun, but it would be a far more practical finish than the plating *ad lib.* which seems to be the only style which makers consider commercially successful. One or two all grey machines at the Show might

prove attractive. Why not a motor cycle Grey Ghost? We know of more than one make of machine which does not offend the tympanum to a greater extent than a slight flicking of the valves on their seats, when the engine is running "light" on a fairly level road with a good surface.

By the way, the best method for removing caked mud is to apply paraffin liberally with a sash tool (painter brush). When the paraffin has been given time t soak *au fond*, the mud will wipe off the frame an plated parts without scratching the surface, and, wh is more important, without raising a horrible dus which settles on everything in the vicinity, includir the cleaner's respiratory organs.

RIDING HINTS.

Acetylene Gas Lamps.

In purchasing a motor cycle, or, indeed, any kind of acetylene lamp, one should always see that the lamp is in good order by putting it to a practical test without delay, as there may be some defect in the lamp or generator which a mere superficial examination may fail to reveal. On a recent occasion we purchased an acetylene lamp of the separate generator type, which appeared to be quite in order. On subsequently filling up with carbide and turning on the water, gas was generated, but failed to pass along the pipe to the burner. On testing the burner with another generator it was found to be quite clear, and on further examination of the new generator it was found that gas was escaping through the air hole in the filling aperture cap of the water chamber. As this continued while the water valve was tightly closed it was evident that there was a leak from the gas chamber to the water chamber, notwithstanding that the water did not appear to leak.

Attention to the Engine.

An experienced motor cyclist relates for the benefit of readers the attention he bestows on his 3 h.p. Triumph machine:

The valves are ground in twice a year, the crank case swilled out and cylinder removed for scraping away the carbon deposits every 700 or 800 miles, and the magneto oil reservoirs cleaned out at the sar time. The exhaust box is dismantled and cleaned o once a year. Round the heads of the set pins holdi the magneto in position a piece of copper wire wrapped and attached to the side bracket, so that a screw came loose it would not be lost.

In the toolbag is carried a magnetised rod, so that case of any small job being undertaken on the road lays out a cloth with the magnet on it, and throws small parts, such as nuts and split pins, on the clo when they adhere to the magnet and are not lost.

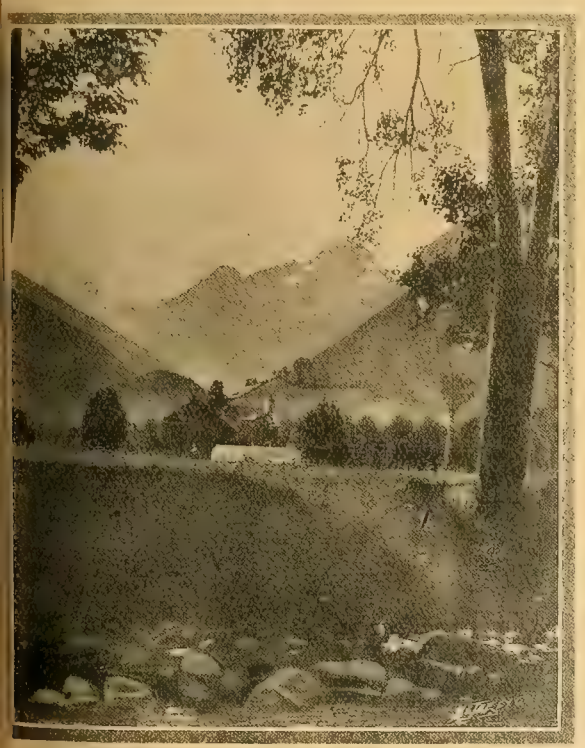
Another article carried (but which must be v seldom, if ever, wanted) is a piece of thick belt leat for making nuts. If a nut is lost, no matter w size, a makeshift can be made out of the leather. hole is made in the leather not quite the size of bolt the nut is to fit, and it will screw on very tigh A drop or two of oil is then put on the leather r which causes the leather to swell, and when it is ti it will last some considerable distance. A method testing for leakage of compression is to place mach where there is no draught. Paint the joints of c and top of cylinder with paraffin, and start the eng If there are any leaks from cylinder fittings, puffs smoke will be seen issuing from every leak at e explosion. Screw the caps down tighter, and if leaks still exist fit new washers which are not so ha

At the 25th anniversary of the German Cycle Club in Berlin on the 14th ult., the principal feature of the occasion was the introduction of the "Motor Cycle Du of the brothers Lüders. These amateur artistes accomplished with success some extraordinarily difficult evolutions on light motor cycles. Illustration No. 1 sh them on one machine, one rider standing on the other's shoulders. No. 2, Riding in a circle side by side both riders seated backward. No. 3, Standing upright on fore and rear axles without making use of the handle-bars. Motosacoche machines were used.

A Few Days in the Pyrenees.

By G. J. C. (Concluded from page 269)

After surmounting the zigzag, I ran a few miles long a winding but almost level road into Arrens. Here the first glimpse of a snow-capped mountain was btained. The enthusiastic photographer might easily pend a day in taking views of fascinating "bits." Returning to lunch at Pierrefitte, the engine was given second gruelling on that day on the road up to Cauterets. The surface was much better than on the orning's run, but the local method of watering the oads led to a rather nasty side-slip, which proved too uch for the footrests. A quarter of an hour was pent in adjusting matters, and then "Excelsior!" but, nlike the famous youth, the speaker lived to tell his wn tale. Cauterets is one of the Pyrenean beauty pots, and lies in a narrow valley surrounded by grand ountains. The town itself is, unfortunately, spoiled y too much attention from travellers. The method lluded to of watering the mountain roads is simplicity self, for it consists of a man with a wooden shovel, ho ladles the water from the gutter, which is also a ream in miniature, on to the highway. It is effective preventing dust, but forms a paste on the surface of ie road, which is very dangerous to rubber-tyred vehicles. Anyone visiting this country should provide himself with a powerful horn, as the local motorists drive in a way that would not be tolerated in England, driving round the sharpest corners without any warning. Indeed, the only safe way on the winding mountain roads is to have the cut-out permanently open. The natives seem to be used to the noise, and take no notice of it. The run back to Pierrefitte in the evening was delightful—the air cool and fresh, and the light on the mountain tops simply glorious. The road was steep enough in most places for the machine to run free, and the clutch could always be slipped in gently, and the engine restarted on approaching a level stretch of road.



Arrens.

A picturesque road near Cauterets.

A Twelve Miles Climb.

Next day I decided to run up to Gavarnie, and, having filled up with water-cooled oil, and given the engine an extra charge or two, began the climb. On this occasion the engine did not appear to be doing its best, and consequently I was obliged to cover ten and a half out of the twelve miles on the first speed. Oil was poured in continuously, and I was thus able to reach the top of the long climb without any signs of

A Few Days in the Pyrenees.—

overheating. The scenery gets wilder and more desolate as one ascends, until finally, the valley broadening somewhat, the village is reached. At the Hotel des Voyageurs, one of the best mountain resting-places I have ever visited, I met some friends who were on a walking tour, and with them I admired the famous Cirque. It is impossible to give an idea of the grandeur of this curious freak of nature. The cascade falling many hundreds of feet looks like an overflow pipe on a house wall, and only when one hears that the Cirque (or Circus) is over a mile across does one begin to realise its size. The writer witnessed the following little incident while walking up the valley. A captain of a certain volunteer corps who was staying at Gavarnie, being desirous of visiting the Cirque, hired him an ass and, as is customary and necessary, a comely but generously proportioned dame to prod the animal at intervals. Progressing thus in state, he was much embarrassed to find the colonel of his regiment and the colonel's wife reposing by the wayside after tramping over from Spain. No natural death will be the lot of the story.

When, after two days' rest, I fetched the motor bicycle out again, the engine absolutely refused to fire; in fact it would not turn round. An investigation showed the exhaust valve to be at fault. Not being able to move the large nut with my King Dick, a messenger was sent for a large wrench. Meantime, it was seen that the valve wa merely glued up owing to too free use of the oil pum and a spoon and a little petrol soon set it free agai but the messenger is still wondering how a nut can b removed with a spoon.

Mountain resting places at Gavarnie.

Bordeaux Cathedral.

For the benefit of those contemplating a tour in th Pyrenees, it may be mentioned that the roads are well graded that a good 3½ h.p. engine with reasonable touring gear and a moderate amount luggage should easily climb all the hills met with, b for comfort and certainty of climbing all gradients tw speeds are incomparably better. I have ridden ma different types of motor cycles, and years ago used put down a large proportion of the fatigue of a lo day's run to the noise of the average machine. Owi to fast driving which is general, and the dang from other road users, the Rip was driven almo always with the cut-out open, but, curiously, this d not affect my somewhat sensitive nerves in any wa and the only possible conclusion is that that wea feeling after a long ride is the result of vibration, whi on a spring-framed machine is entirely absent.

After running down to Luz, I intended crossi the Col de Tourmalet, but a thunderstorm upset m calculations, and as time was running short, a retu was made direct to Pau *viâ* Pierrefitte and Lourd At Pau another thunderstorm drove me to train inste of riding back to Bordeaux, and so ended a ve pleasant few days' trip in a country which wou delight not only the ardent motorist, but also t searcher after new scenery and fresh ideas.

THE END-TO-END TRIAL.

ITS COST AND OTHER HINTS TO COMPETITORS.

By H. G. COVE.

ALTHOUGH I do not consider the End-to-end a very arduous competition, yet I would strongly advise all intending amateur competitors to begin getting fit about a month in advance. By this I mean that about the middle of June the rider should begin to prepare for the contest by taking good long rides on a motor cycle, varied with a little walking or whatever exercise the particular competitor prefers for getting fit, and this should be continued right up to the day of the start. There is nothing so good as to enter upon a long competition feeling thoroughly fit and well, and I know more than one experienced rider who, on the third day of the 1906 End-to-end, said, "Now I am feeling a little bit fit, and ready to tackle the Grampians," whereas in the earlier portion of the run the stiff Cornish and Devonshire hills were almost too much for some of them.

The next important point is the choice of a good machine, and here I would say that, although 7 h.p. twins and 2¾ h.p. singles got through very well in 1906, yet I consider the ideal machine to be a 3½ h.p. single or a 5 h.p. twin, and a man mounted on a machine of any good make and of about these h.p.'s is far better off than another on a lightweight or a huge twin.

I would advise every rider to learn thoroughly the various portions of his machine before attempting the ride, for it is courting disaster to start on a machine that one has only received from the manufacturer, say, a week or so beforehand.

During the competition only one hour per day is allowed for adjustments and general overhauling, and this hour being in the morning from 7 to 8, one has to be quite sure about turning out of bed in good time in order to take full advantage of it. There is little time on the actual run itself for repairs, and it is far better for a man to see that his machine is in perfect trim before starting than to attempt the day's run on a machine he has not thoroughly overhauled, and trust to luck to get through. Repairs and adjustments are not allowed whilst in controls or at the end of the day's run.

Spare Parts.

Spare parts, such as valves, small nuts, and plugs, are very necessary, for, although one may be able to purchase these on the road, it will be found much better to carry them. The competition rules do not prohibit their purchase *en route*, but there is always the possibility of not getting the exact sizes required.

With regard to tyres, I would lay down a hard and fast rule, and say, "Start with perfectly new ones." The roads vary so much, and the worst portions are encountered so far away North, that it is false economy to start with tyres that have had much wear. Spare tubes should be carried, and a good puncture repair outfit.

In some parts the controls are far separated, and there is plenty of time for a man to repair punctures; but there are one or two sections in which, should a man be unfortunate enough to puncture a tyre, there is little chance of his getting into control in time to save loss of marks. I would, therefore, again urge all competitors to see that their outer covers and air tubes are new and provided with a good stout tread.

Now, as to the probable cost, I do not think one can lay down any hard and fast rule, but the journey can be easily accomplished and all expenses paid if one sets aside £1 per day. Hotel bills are fairly reasonable, and as the A.C.U. makes special arrangements with the hotel-keepers, all food and a comfortable bed are provided for 11s. per day; the remaining 9s. is quite sufficient for petrol and other odds and ends.

The Journey Home.

The cost of getting to Land's End and returning home from John-o'-Groat's is a matter that can be settled by consulting the railway company at the town from which the competitor starts. If it is decided to travel by road, £1 per day is ample, and the journey could possibly be accomplished for much less. Last time very few returned by road, as they desired in most cases to return to their various pursuits too soon to allow them to undertake the long journey by road.

A Few Suggestions.

There are a few suggestions I should like to make, and they are as follows:

1. Every competitor should rise early, have a good breakfast, and be ready at the door of the motor house at 7 a.m., for he will find that he will require every minute of the hour allowed in which to overhaul and clean his machine.

2. Do not rush blindly from control to control, but take the journey at a good steady pace, with always a bit in hand, to allow for punctures and adjustments. The old maxim that it is not the miles we travel but the pace that kills is very applicable to motor cycling, *for many of the engine troubles can be traced to over-driving.*

3. The 1906 regulations did not penalise a competitor who arrived outside a control before time, but I believe that this year the A.C.U. will not treat competitors lightly who, by greatly exceeding the legal limit, wait outside the control, a long way in advance of schedule time.

4. There are hills on the route that should give the ordinary competitor much trouble, but there are many, on the first day of the run especially, which come upon the rider quite suddenly, and, should he not be prepared for them, it is possible that overheating may result. It is well, therefore, on the first day's run to take things rather quietly. On the second day splendid roads are encountered, with only one or two stiff hills. On the third day, the route is trying from Warrington to Preston, it being cobbles and tramlines nearly the whole of the way.

On the fourth day there is nothing much of importance, except that, at the end of it, one arrives at the most delightful town there is in Scotland—Pitlochry—where the hotel accommodation is of the best and the scenery grand.

On the fifth day the Grampians are encountered, and here one may expect twenty odd miles of really rough going. The road was in a terrible state last time, the smallest stones being as large as one's fist, and, although a strong wind was not experienced, yet it is as well to be prepared for one.

The sixth and last day brings us to the hills over the Ord of Caithness, ending up with Berriedale. In 1905 competitors were warned in the morning of a compulsory stop before this hill, as it is dangerous to ride down and "more dangerous to ride up." Very few men got round the hairpin corner; in fact, it entails almost an acrobatic performance to do so, but it is worth trying, if only for the fun of the thing.

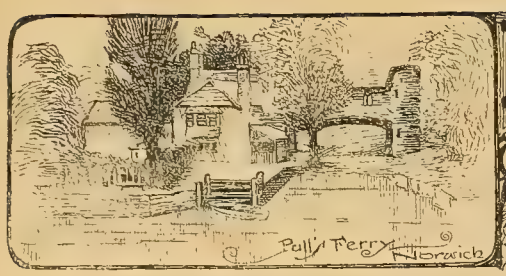
At Berriedale we were told that all was plain sailing into Wick, but I would warn riders of one nasty hill—I think at Dunbeath, about seven miles further on—which was nearly the undoing of one competitor the year before last. It is a steep down grade, with a sharp left-hand turning, and if one misses the turn a collision with a stone wall is unavoidable.

I presume that, as before, we shall arrive at Wick in good time for lunch, in which case competitors will have plenty of time to get to John-o'-Groat's. But a word of warning here is needed. Two, if not three, competitors left Wick with plenty of marks in hand to obtain a gold medal, but, by being wrongly directed, they went to Thurso instead of Groat's. One ran out of petrol on the way, and, losing many valuable marks, only received a silver medal. It will, therefore, be clear to all that constant care is needed at every part of the course, at the start and at the finish.

Send your Entry in Early.

In conclusion, I would ask all those who intend to take part to enter immediately the forms are issued, as by this means the work of the committee and the secretary is much lightened. If the officials know well in advance how many intend to participate, they can make the necessary arrangements for their comfort.

Another word and I have finished. Arrive at Penzance in good time, and report yourself immediately to the officials. Place your machine wherever requested by the judges, and when finally passed and you receive instructions obey them to the letter. By this means you will be assisting the officials, whose sole idea is to do all in their power for the A.C.U. and the competitors.



Occasional Comments.

By Ixion.

Lightweights on Grease.

There is no doubt that if one's district is not too hilly, the lightweight is a jolly little mount for winter riding. Instead of slithering alongside nervously waiting for a patch of dry ground to give one a chance to hop into the saddle, you can push off from the kerb edge seated on the saddle, and commence pedalling. You can slow the machine down to a crawl over the worst patches of grease without making the engine jerk at the back wheel and skid it, and if you have to wait behind a cart for a minute or two you can pedal the machine without getting hot and moist all over. I think the introduction of efficient lightweights will lead to a great deal more winter riding than has been done hitherto.

Some Magneto Improvements.

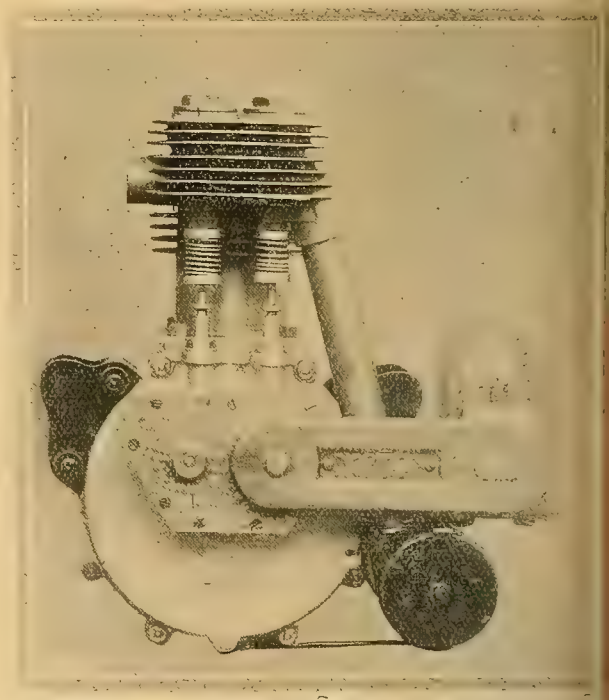
Quite a little host of new magnetos for motor cycle engines are coming upon the market, and in examining them I have encountered the following innovations, which may interest readers: Double contact breaker spring, serving two purposes—(1) keeping platina from breaking contact too far and (2) stiffening main spring actuating bell crank arm, and so obviating poor running, due to loss of temper in this spring; contact breaker detachable by pushing in a pair of spring pushes, without the use of any tools; the use of very large and substantial screws for holding the platinum rivets, so that the gap between the platina in the break position is easily adjustable after wear; substitution of steel cams for the softer fibre ring.

Strange Happenings.

My incredulous correspondent has addressed a second and more polite letter to me on the subject of the gudgeon screws emerging from the cylinder *viâ* the walls, and only leaving a hole capable of being repaired by a clamped band. I freely admit the incidents are extraordinary ones, but inspection of the cylinders leaves one no less extraordinary alternative. It certainly seems incredible that the flywheels could jerk the errant gudgeon screw against the cylinder wall with sufficient force to drill a fairly neat orifice. I would timidly tender the suggestion that the mishap occurred to a very thin cylinder.

Spring Forks and Side-slip.

I am very loth to believe the contention of Mr. T. W. Irlam (page 244) that spring forks either emphasise or induce side-slip. It is easily granted if the springs be of a design that permits any lateral sway, but not otherwise. I am inclined to think the rider is probably responsible, as he is for nearly every side-slip, and that if Mr. Irlam and his friends exchanged machines and then charged the sand, the same riders would come croppers on their new mounts. Pace and nerve have a great deal to do with the safe passage of such obstacles as sand, new metal, and even grease. Mr. A. G. Reynolds stated the other day that the best preventive of side-slip was pace. This is equal to saying "nerve," for a timid rider would not dare to take grease at pace. Perhaps, too, there is something in sheer speed, for Mr. Reynolds said he always traversed grease "as fast as he could." I, on the other hand, take grease at the lowest road speed which permits my engine to revolve sweetly and evenly without jerking, *i.e.*, on a Motosacoche I take grease



A new pattern 3½ h.p. Norton engine (82 x 90 mm.) with M.O.V. showing the Bosch magneto and aluminium chain case.

at eight miles an hour, on a flexible 3½ h.p. at twelve and on a highish geared twin at twenty-two. We have not Mr. Irlam's frequent opportunities of riding through deep sand, but the sensation, on the few occasions when I have experienced it, has been just like riding over coarse new metal, though somewhat less abrupt. I find medium speeds dangerous on a thick patch of unrolled stones. I can get over them with absolute safety if I go full tilt; and my only alternative is to go so slowly that I can put my feet down and switch off comfortably if the rolling becomes too pronounced. If I had veldt tracks to ride on, I should first try charging the sand at a decent speed; I might come off no doubt, but if I did, I fancy I should come off just as quickly with a spring fork or a rigid fork, if differently.

EXPERIENCES ON BROOKLANDS TRACK.

By One who has Tried it.

I AM glad to see that the B.A.R.C. has decided to include a motor cycle race at the meeting on Easter Monday as an experiment to see if it will "catch on" with the public.

There is no doubt that the track is most suitable for motor cycle races, and it will enable some really fast times being made, as the trouble with Canning Town and other English tracks is that the banking is not suitable for speeds much in excess of fifty miles per hour, and to prevent this speed being exceeded a limit has to be placed on cylinder capacity.

This works out at about one-third of a litre, or 75 by 75 mm. However, in spite of these restrictions, several racers have done close to a mile a minute at Canning Town. The fastest combination appeared to be a Jap engine on Collier's Matchless, with a bore of 85 mm. and a stroke of 60 mm.

Now on Brooklands a motor bicycle travelling at fifty miles per hour would not even require to run up on to the banking, owing to the very gradual curve, and there is ample room for three or four competitors to ride side by side. This will give an idea of how safe the track is.

There were one or two bumpy places, but the track is now repaired. The most difficult thing in the future will be to arrange a handicap which will be fair to all. It obviously would be absurd to rate them on cylinder bore alone, if racers and roadsters are to compete together, and expect an exciting finish. The fairest way would be as follows.

The really fast men are all well known, and from the times they have made last year at Canning Town it would be an easy matter to handicap them to give an almost dead heat, as their racing machines will go round the track time after time with hardly a second's variation. The semi-racers and roadsters are more difficult, as their times vary more.

Assuming a scratch man can do sixty miles per hour (usually single cylinder racers stripped), we should then put down fifty-five miles per hour for Tourist Trophy machines, A.C.U. definition; full roadsters, about fifty miles per hour. Then racers, about 60s. per mile; Tourist Trophy models, 65s. per mile; full roadsters, 70s. per mile.

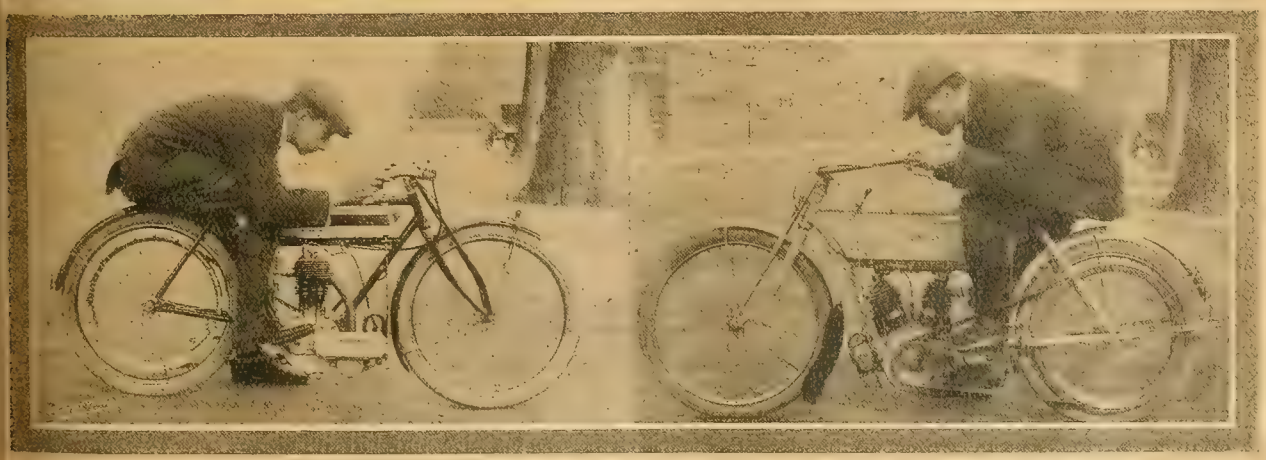
My Idea of a Fair Race.

Distance.—Twice round the track (five miles). Start the roadsters off all together. 25s. after, give the Tourist Trophy models word to go. Wait 25s. more, and then start the racers.

That is better than trying to start men (scattered all round a big track like Brooklands) at the same moment. First over the tape the winner. Every competitor covers the same distance, and can get his times afterwards for future races. Of course, it will be hard on some competitors, but the fact must be borne in mind that unless even and exciting finishes can be guaranteed the public will lose interest, and motor cycle events are liable to be discontinued.

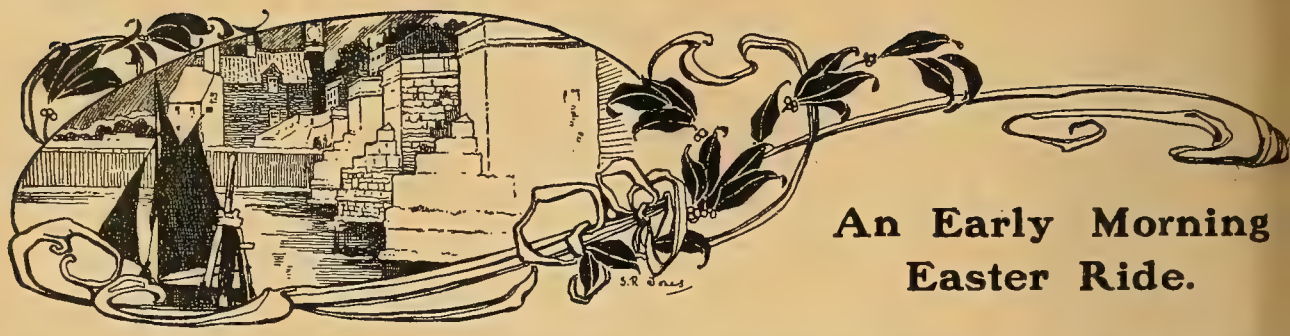
It makes a good sporting race for the various types of machines at present in use, and, while it undoubtedly hits the expert who can get a mile a minute out of a 2¾ h.p. machine to be beaten on handicap by a 5 h.p. twin which can only do fifty-one miles per hour, he has the satisfaction of showing what he can do, even if he does not get the cup. It also enables many men to enter who otherwise would not care to go to the trouble of stripping their machines for the race.

On these lines I think we should get a record entry and some exciting finishes.



W G. McMinnies (3½ h.p. Tourist Trophy Triumph). O. L. Bickford (5 h.p. Tourist Trophy Vindec).

These two Oxford enthusiasts contested the first motor cycle match on the Brooklands Track, and are among the entrants for the first open motor cycle race at Brooklands on Easter Monday.



An Early Morning Easter Ride.

THE majority of motor cyclists take their rides during the daytime, but did they only know of the delights which await the motor cyclist who will ride early to meet the sun, I fancy more motor cycles would be seen on the roads during the "wee sma' hours" of the morning.

The writer has more than once left a dance at three o'clock in the morning, changed to wa rner garments, and set out for a thirty miles rou d before finally settling down to rest. When the moon is shining full even on a frosty night, such a ride is most refreshing and enjoyable.

However, the present ride has nothing to do with moonlight trips. It deals with a short holiday spent last Easter with a motor cycle.

The writer, being employed in a bank, naturally wished to visit his people during the Easter holiday. Deciding to motor, the distance being some ninety-five miles, he retired early to rest, with the intention of riding by night and early dawn to his destination.

The ride to be attempted was one from Scarborough to Skipton. The machine was a 2½ h.p. lightweight Ariel fitted with all the necessary touring outfit. The machine had run for a distance of 4,000 miles without trouble, and no mishaps were anticipated on the early morning run.

Ready to Start at 3 30 a.m.

By means of the alarum clock the writer was wakened at 3 a.m., and at 3.30 was dressed and ready to start. Everything had been put in readiness the preceding evening. It was therefore only necessary to light the lamp, inject paraffin through the compression tap, and put on waterproofs before starting.

From the commencement everything went well. The lamp burned brightly, and the engine fired first turn of the pedals.

At the start there was no sign of daylight, and the bright light shed by the powerful acetylene lamp was much needed and appreciated.

After riding about an hour without any sound other than the crisp pop, pop of the engine a peculiar feeling came over me that I could see the road more distinctly, and yet there did not appear to be any more light in the sky. This was really the beginning of the dawn, and about half an hour afterwards the road could be plainly seen. The water of the lamp was then turned off, as the light was not required. As the road could now be plainly seen, and ! owing there would be no traps at that time of the day, the spark was advanced and the throttle opened, and a few moments later the machine was flying along, all out.

Brighter and brighter became the sky, and the air, which was rather cold at the start, became warmer.

Then came the sunrise. I will attempt to describe it, but am afraid I cannot do justice to it. Every where silence. The amber streaks in the sky leapin into crimson flame, deepening as they sailed alon to a tawny orange. Within the space of a few minute the whole aspect of the heavens completely changed The burning scarlet and orange hues had all melte into a transparent yet brilliant shade of pale mauve across the sun slowly floated clouds of pour gree fringed with a soft primrose shade. Now and again the cry of some wild bird, startled by the approach the motor, was heard, and seemed to intensify the stil ness of the morning.

To a lover of nature and the picturesque the sce was entrancing, and made one long to stop for a spa to admire the beauties which lay on every hand.

Time was, however, progressing, and this glorio scene was soon left behind. The sunrise soon lost beauty, and had it not been for the absence of traf on the roads and the freshness of the morning air o could have imagined that it was mid-day.

Alone on the Earth.

Up to this time not a single soul had been seen, a I was quickly approaching Wetherby—that famc control known to so many competitors in the Londc Edinburgh run.

It was here that the first signs of life were seen. few men going to work eyed me as I flew past, l otherwise made no remark at my early appearance.

On, on sped the plucky little motor, never falter in its stride, but keeping up its merry explosions w a heart which seemed sound and true. The next m however, showed how one cannot always depend on sound of the engine. Misfiring commenced, and worse and worse, but, wishing to get to my destinati I did not dismount to investigate matters. Finally, engine suddenly stopped firing altogether, and c pression vanished at the same time. The diagnc proved correct before dismounting. The compress going suddenly pointed to the valves, and in this c the cotter had sheared. It was the work of a moments to put in the complete valve which I alw carried as a spare.

During the time I was fitting this valve a tra came up and proffered assistance, saying that he an "engineer." He did not look a particul savoury one, so I declined his aid, and completed job myself, and left him standing watching me u I was out of sight.

The lost cotter caused the only s p, and I arri at my destination in good time for a steaming br fast, to which I did full justice.

An Early Morning Easter Ride.—

Mention might be made of the quantity of game of different kinds which crossed the road on this journey. Pheasants, hares, rabbits, and coveys of partridges were seen, all intent on getting their morning meal.

The return journey was accomplished at night, and was a non-stop journey throughout. Several animals crossed the road—in one case a large animal, which I think was a fox—and numerous moles, which can run very fast when they see the light of a motor cycle coming their way. A few rabbits were also noticed, but of human life there was practically none.

Such, then, is the brief account of the most enjoyable motor run I ever made. The freshness of the air makes one inclined to shout with delight. When one has also a well-tuned engine throbbing beneath one the sensation of flying along without the least effort must be experienced to be thoroughly appreciated.

Those readers who remember the summer weather which was experienced last Easter should make a similar attempt at holiday-making this year, commencing the journey at about 3.30 to 4 a.m.

CLARENCE PONTING.

CULLED FROM CUDHAM.

I DO not think that any of the numerous spectators at the Lewisham Automobile Club's hill-climbing competition held on the 4th inst. at the celebrated Cudham Hill expected the lightweight machines to reach the finishing line either with or without aid from the pedalling gear; in fact, many were surprised to see so many of the heavyweights succeed. One of the oldest motor cyclists in this country offered to bet a certain rider five to one that he would not get up the hill. This was before the rider knew that the venue of the hill-climb was Cudham. The rider fought shy, much to the relief of the other party later in the day. Singularly, this particular rider (F. W. Barnes), to my mind, made the best performance of the day. Of this more anon.

Of the five lightweights entered two succeeded in reaching the finish, the weights of these two machines, according to the programme, being 94 lbs. and 95 lbs. respectively. The best performance (which does not necessarily mean the fastest) was made by the Fairy, which was to be expected, since its power (2½ h.p.) was ¾ h.p. more than the other successful machine, which was a 1¾ h.p. Chase ridden by Arthur Chase, who I was pleased to see on the "warpath" again. Chase is well known as an old professional cyclist, and his muscular powers doubtless were no mean factor in his performance. He started pedalling comparatively early, and went "all out" right up to the finish.

Almost Climbed Cudham without Pedalling.

J. B. Beck, the rider of the lightweight Fairy, reached a point some twenty-five yards from the finish before he started pedalling. Apparently he was unaware that pedalling was permitted, for when he was just on the point of stopping somebody shouted to him to pedal, and he very quickly responded, and saved the situation. There is no doubt Beck could have improved his time considerably by pedalling earlier. Of the other three machines there was little to choose between their relative performances, all three coming to a standstill at about the same spot.

Naturally the performance of the lightweights suffered in comparison with the heavyweights, which literally flew up the hill—so fast that almost every rider eased up at the S bend by switching off or by some other means. Adverting to F. W. Barnes's performance on the spring frame Zenette, I wish it to be distinctly understood that I leave speed out of the question in referring to his performance. This machine was fitted with the variable gear recently described in *The Motor Cycle*, and it was this gear that enabled the rider to climb the hill and negotiate the tricky S bend in a comfortable way, comfortable because the speed was reasonable.

Altering the Gear to Suit the Gradient.

He was busy altering the gear ratio on his machine whilst negotiating the S bend, which means that he had only one hand free for steering, whereas all the other riders in Classes I. and II. were obliged to cling to their handle-bars. It was the first time this variable gear had appeared in competition, and it behaved admirably. I should, however, like to see the gear controlled from the handle-bar. I am sure that Barnes's performance impressed any prospective motor cyclists that may have been present, and, indeed, some actual motor cyclists, more than the wild rush and dash of other machines, which leapt about on the uneven surface of the road in a manner calculated to frighten rather than please. I say this in no deprecatory sense. Nobody admired the pluck of the riders of the fastest machines more than I did; but though these fast machines will appeal to one class, they will not to another. I suppose the point that concerns the makers is, Which class is in the majority? Thousands of motor cyclists, and maybe hundreds of prospective motor cyclists, will have read the accounts of the competition, and be in absolute ignorance of the risks involved by those who made the fastest times. I anticipate that some of the competitors will assert that they could have ridden slowly or comparatively slowly, but I doubt it. The top of the hill is 1 in 4.3, and it was necessary to rush at this section and negotiate two nasty bends. Thank goodness there are few hills like Cudham in existence.

HARRY G. BELL.

An article recently published in *The Motor Cycle* —"The Selection of Gear Ratio"—has prompted Messrs. Forbes and Co., Chapel Street Works, Edinburgh, to write us stating that they are prepared to work out power curves of any motor cycle engine and take brake tests. Few firms undertake this work in connection with motor cycles.

J. C. Fuller and Sons send us a sample of their latest non-trembler induction coil for motor cycles. This coil retails at an exceptionally low price; nevertheless it is well made and finished. It measures over all 4in. by 2⅞in. by 2⅝in., and it is therefore particularly suitable for lightweight machines. The makers' address is Woodland Works, Bow, E.

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not **must be accompanied with a stamped addressed envelope for reply.**

Preventing a Leak of Compression.

Kindly tell me how to cure loss of compression in my 3½ h.p. Quadrant? The leak occurs where the inlet valve seating screws into the cylinder. I have tried new washers, and have also tried fortifying them with asbestos thread, but after a brief improvement the leak is as bad as ever. I have seen fish glue recommended in *The Motor Cycle*. Could you tell me how this should be applied, and where one can get it?—A.M.T., Walton.

The trouble may probably be cured by fitting two washers, one on top of the other. Fish glue may be obtained from any drysalters. It should be painted round the edge of the valve cage.

Specification of a New Mount.

I am about to have a touring machine built up for me with a 6 h.p. twin engine, and seek your advice upon the following specification: (1.) Chater-Lea No. 6 frame made about four inches longer to take magneto between back of rear cylinder and pedal bracket. (2.) Bosch high tension magneto. (3.) What size driving belt (rubber) shall I require for this engine with a variable pulley? (4.) Brown and Barlow carburetter? (5.) If I fit footboards shall I require pedals as well, if for warming up I fit an engine starting device? (6.) Are pan seats comfortable for long-distance riding in conjunction with footboards? If so, where can I obtain an aluminium one as fitted to some machines? J. B. Brooks and Co. inform us they do not make a pan seat. (7.) Tyres 26in. by 2¼in. Palmers, with Rich's detachable tubes. Are the latter reliable?—S.N.

(1 and 2.) We agree. (3.) We should advise a 1in. belt, and even larger if a sidecar is to be used. (4.) Brown and Barlow. (5.) You do not require pedals if you fit a device for starting the engine. (6.) Yes, these seats are most comfortable. Messrs. Brooks do not actually make a pan seat, but they make a spring seat very like one, and we think you can buy nothing better. (7.) The tyres and tubes mentioned are to be recommended.

From South to North and Return.

During the Easter vacation I intend (with a friend) having a tour. My object is to get to Newcastle. I can manage as far as Luton from here (Harrow), but after that am rather in a fog as to which towns to pass through, being the best for motor cycles. If you could let me have a list of the main places *en route* I should be obliged. On the return we intend travelling *viâ* the West Coast, *i.e.*, Carlisle, Shap, Preston, Wigan, Shrewsbury, Oxford, and London. But the return is not so important, as we shall not be in a hurry after once leaving Newcastle. —E.L.

Your best route from Luton would be as follows: Luton, Hitchin, Biggleswade, Stilton, Stamford, Grantham, Newark, Retford, Doncaster, Aberford, Wetherby, Boroughbridge, Scotch Corner, Darlington, Durham, and Newcastle. Instead of coming home through Wigan, etc., it would not be a bad idea to follow this route: Kendal, Ingleton, Settle, Skipton, and Otley, from which you continue until you strike the Great North Road again just south of Wetherby.

Defective Seating in Carburetter Needle Valve.

I am interested in I.B 816's letter in *The Motor Cycle re* "the petrol dripping from the carburetter." I am suffering from exactly the same trouble myself. I have taken my carburetter (which is a Longuemare) to pieces, and have had the needle ground in, but still the petrol rises too high in the jet and overflows. You state "that the weight on the needle should be raised a fraction." How can I do that? Do you mean the weight to be attached to the top of the actual needle itself, or to the round brass cylinder through which the needle goes? Would a little solder do for a weight? I believe myself the needle has not been ground in quite straight, and consequently the little cylinder rubs against the sides, and does not close properly, hence the overflow in the next chamber. Do you think a new needle would put the matter right? —J.O.H., Shrewsbury.

First of all make sure that the needle valve itself beds properly on to its seating. You can test this by removing the float and noticing if petrol finds its way past the needle point. Secondly, if the level is too high (the petrol should come to within about ⅛in. of the top of the jet) raise the weight slightly on the needle valve. The float should be lifted off the valve and the needle removed, and the weight held in a gas flame for a few seconds. It should then be placed between two pieces of wood in the jaws of a vice, and the end opposite the point of the needle should be gently tapped. The float may then be replaced and the height of the petrol in the jet measured. See the article which appeared in *The Motor Cycle* on the subject on May 8th, 1907. The motor bicycle should be perfectly level and not on a stand when the level of the petrol is being tested.

Trembler Coil at Fault.

Could you suggest a few causes for a trembler coil refusing to vibrate? It has only lately started to do this. It will tremble for, say, 20 secs., and then the disc will stick to the iron core and not come away. If I turn back the contact screw it does not vibrate at all. Can this be explained by a short circuit anywhere, or accumulator run down? As the latter only gives 3.75 volts I have sent it to be recharged, but a ¼-volt should not make any difference to the coil. The coil first started to do this after adjusting the screw as you said—turn back the screw until it misfires, and then turn in a trifle and fix. As this could have done no harm, it must only be a coincidence.—H.E.A.

Probably the accumulator was showing a fictitious voltage, and contained a less number of volts than was shown on the voltmeter. 3.75 volts is not enough to work the coil properly, and probably you will find the coil will function all right when accumulator is recharged. If, however, the coil continues to behave in the same way probably a new blade is required. Also see that the platinum points are true and clean, and that the platinum has not all disappeared. Sometimes when locking the screw the adjustment of the coil is upset.

What the motor cycle world has been asking for—

is embodied in the new

MOTO-REVE

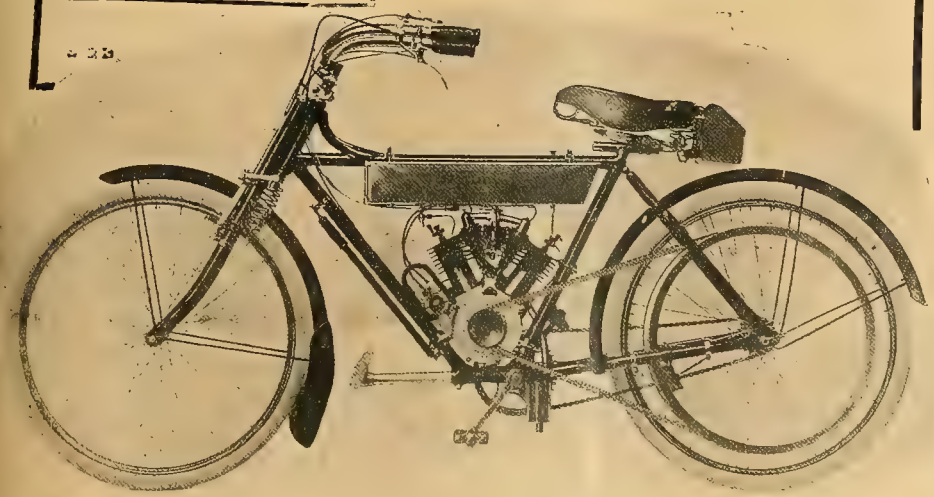
1908 MODEL
has
Direct Drive by Belt,
"Druid" Spring Forks,
Footrests,
Improved Saddle and Toolbag,
Improved Gear Drive on Engine,
Motor Cycle Tyres,
Low, comfortable Frame,
Petrol Gauge,
and all the latest refinements.

A practical lightweight, with direct drive by V belt, and ample power for hill-climbing.

That is what the new D.D. model offers, and a glance at the accompanying specification will show how well every point has been considered.

Full particulars can be had by asking for List D.D.

THE MOTO-REVE CO.,
138, GRAY'S INN RD., W.C.



PRICE
Complete,
as specified and illustrated, and fitted ready for immediate use,
37
GUINEAS.

Trial Trips can be Arranged.

10,000 miles without a puncture!

41, WELLINGTON STREET, COVENT GARDEN, LONDON, W.C.

THE PALMER TYRE, LTD., 119, SHAFTESBURY AVENUE, W.C. Nov. 1st, 1907

Gentlemen,—I have pleasure in forwarding you herewith a 2¼in. Palmer Cord Motor-Cycle Cover and Tube which has now done nearly 10,000 miles, and as you will see, is as good as ever.

I fitted it to the front wheel of my motor cycle in May, 1906, and took it off to-day to see what it was like inside.

It has only once been touched with the pump since fitted, and has never been punctured.

It has carried me safely through many important competitions, including A.C.C. Land's End to John-o'-Groat's Trial, 1906; London to Plymouth; and six days' trial, 1907; M.C.C. London to Edinburgh, 1907, and also several long tours.

The ribs are not worn much, and both cover and tube look like being good enough for next season.

Yours faithfully, H. GILLARD COVE.

The Longevity of Palmer Motor Cycle Tyres

becomes more than a mere statement in face of the above experience; it is a fact!

THE PALMER TYRE, LTD.,

Shaftesbury Avenue, London, W.C.

THE

Premier Searchlight

is now a recognised **necessity** on a modern motor cycle. In a recently published voluntary testimonial a delighted user says it "**FILLS A GAP** that has been open for so long." Now, belated copyists are claiming to **fill that gap.** But the gap can't be filled twice. We were there first. We are not saying much about the details of the **PREMIER Searchlight** this week. Everybody knows now that the price is **30/=,** **INCLUDING GENERATOR,** and that it stands alone as the original and ideal **BRITISH-MADE Searchlight.** In this advertisement we want to introduce the

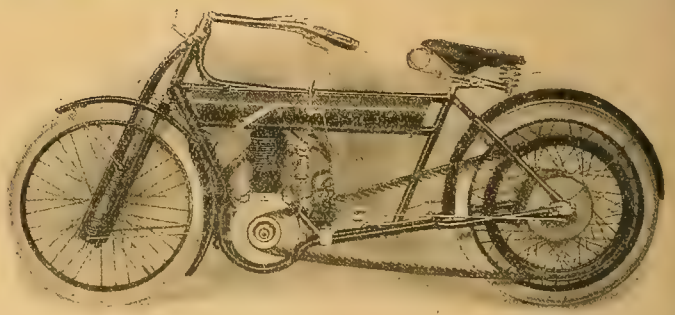
WEIGHT:
1 lb. 10 oz.
Compare this with that of some of the clumsy copies.

WARWICK Motor Cycle

(The Car-style Machine).

Price 45 Guineas.

With PREMIER Two-speed GEAR and ROC (licensed) Internal-expanding CLUTCH.



It is a little in front of the others in the race towards Perfection—not much, only two or three seasons, perhaps—but it represents the goal of development on present lines. Wheelbases have been growing gradually longer, and frames have been dropping lower, every year. The wheelbase of the **WARWICK** is 5ft. long, and the saddle is 31in. from the ground. The rider sits in the saddle, and lets in the clutch with a pedal (car-style). He can start as easily uphill as elsewhere. Traffic is more easily negotiated with the 4 h.p. engine fitted than it is with a 2 h.p. engine without the **PREMIER TWO-SPEED GEAR** and **ROC** (licensed) Internal Expanding **CLUTCH,** which makes these things possible, and renders pedals and pedal-gear obsolete.

IMMEDIATE DELIVERY from Stock. Fullest details on application.

THE PREMIER MOTOR CO., LTD., Aston Road and Dartmouth Street, BIRMINGHAM.

A Mysterious Failure.

Can you explain what makes an otherwise perfect machine fail after, say, five miles on half throttle against a wind? The symptoms are a sudden stop within a few yards, no knocking, but a peculiar choking noise as though piston was about to seize. A hurried dismount proves everything quite free, and engine restarts immediately when extra air is closed. Lubrication ample, correct mixture, engine not particularly hot, magneto ignition all in perfect order, petrol pipe clean, vent to petrol tank and jet clean. Is there any truth in the theory that float chamber can be emptied faster than the supply can be maintained?—PUZZLED SECUNDUS.

The symptoms are peculiar but not unknown to us. It sounds like tight piston rings. The theory regarding float chamber could only be upheld if the passage or passages from float chamber to jet chamber were smaller than the jet, or there was some communication between jet chamber and float chamber other than the petrol duct. We should recommend an examination of piston rings and cylinder, also see that needle valve does not stick or float may jam against sides of float chamber, and by its failure to sink it keeps needle valve closed. The point of needle valve should not be same taper as hole, or it may stick in the hole; it should only bear evenly on top of cone.

Touring from York to Devonshire.

Next month I intend motor cycling from York to Exeter (Devonshire). As I do not know that part of the country at all I am writing to ask you if you could kindly tell me what counties and towns, etc., are worth seeing. As I have the three Contour Road Books I shall have no difficulty in finding the road if I know where I want to go.—B.M., York.

The route we presume you would follow we give hereunder: York, Doncaster, Worksop, Mansfield, Derby, Burton, Tamworth, and Coventry. Here the country becomes more interesting. Kenilworth (famous for its castle), Warwick (also famous for its castle), Stratford-on-Avon (the birthplace of Shakespeare), Broadway (an exceedingly picturesque village at the foot of the Cotswold Hills, the home of Madame de Navarro, Miss Mary Anderson), Cheltenham, Gloucester (famous for its cathedral), while in the neighbourhood is Tewkesbury (which contains a fine abbey), Stroud, Bath (here Bath Abbey will be found interesting), and Radstock. Halfway between this town and Wells is the turning to the village of Priddy, which you had better look for on the local maps. From this village Cheddar Gorge is best approached, which is a remarkably fine piece of scenery. This, of course, is out of your way. Having seen Cheddar Gorge you would proceed south *viâ* Axbridge, Bridgwater, and Taunton. If you do not go to Cheddar Gorge continue straight on to Wells (famous for its cathedral), Glastonbury (famous for its abbey), and continue to Taunton through Ottery and Durston. From Taunton you reach Exeter *viâ* Cullompton.

Dry Battery Ignition.

I use a 3½ h.p. light tricar as a runabout, and a large amount of my riding consists of short distances, say five to ten miles, and then perhaps a spell of a week or so during which I do not use machine. I find the usual method of accumulator ignition a source of trouble under these conditions on account of the constant recharging, whether the machine is used or not, to say nothing of that uncertain feeling as to whether accumulators are run down or not. Do you advise ignition by dry battery (trembler coil)? Do dry batteries run down of their own accord, or deteriorate in any way by keeping if properly switched off? Are they destroyed when used up?—F.H.W.

Under the circumstances a dry battery might be of assistance, but it is absolutely essential that a plain coil is used. All batteries run down quicker if used with a trembler coil, which is usually more wasteful in current than a plain coil. When a dry battery has run down it is no further use without a lot of messing, which is not worth the bother. Dry cells deteriorate of their own accord, but not so much if kept in a cool place.

READERS' REPLIES.

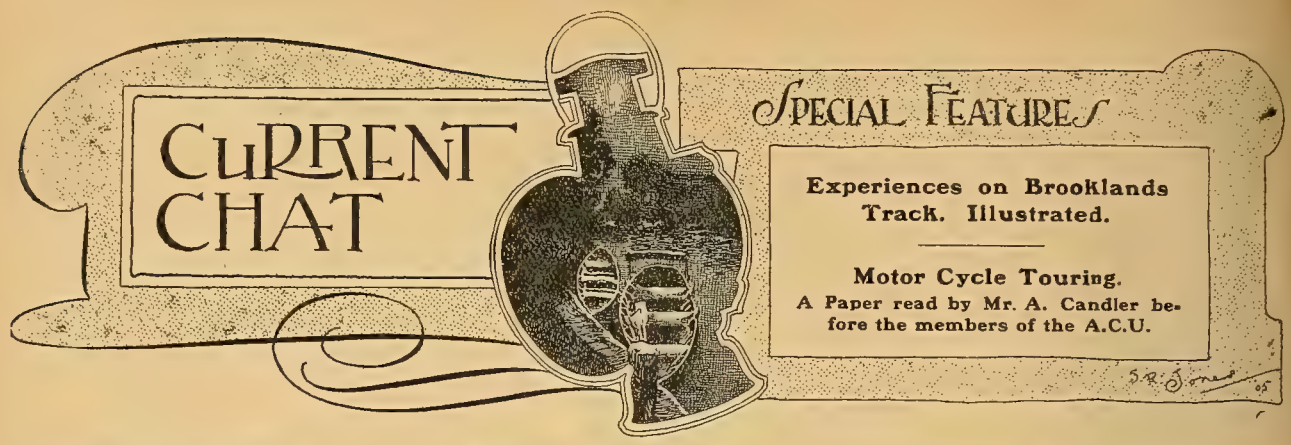
Re the query raised by "A.M." (Hanley). He will not find dual coil ignition workable on his Minerva, that is, if he intends using a plain and trembler coil. I recently made a similar kind of experiment, also on a 3½ h.p. Minerva, fitting up a very fine distributer coil off a six-cylinder Napier car, and as you point out, even with a very fine trembler coil a slight resetting on the timing is necessary. It is not possible on a Minerva to effect this by resetting the sparking cam as it fits on a square shaft, but a tooth in the timing did it in my case. With this very high speed trembler, I get better results than with any plain coil or magneto, as it starts from a lame walking pace and fires perfectly at slowest speeds, has large contacts, and as far as I can see takes less current than the previous plain coil. With a good accumulator I anticipate it will require less attention than a magneto. A good trembler coil will work perfectly with the Minerva make and break. With regard to the mysterious trouble raised by your correspondent, I have known exactly the same thing occur on a Minerva through a crack in exhaust valve seating, this expanding as engine got hot, hence falling off in power.—DISTRIBUTER.

About a month ago I wrote to you as to the difficulties I had with my 2¾ h.p. Bradbury motor cycle. It would not climb the slightest hill unassisted. You very kindly gave me some hints as to larger jet for carburetter. This made very little difference, if any. I fitted new piston rings myself; this improved the compression, but seemed to make very little difference in the climbing. A few days ago I took my machine to a motor works in despair, and the people there found that the exhaust valve was wrongly timed, and the explosion did not occur until the piston was half-way down because the valve was not closed. I have since tried the machine, and it flies up the hills.—J.F.P., Bath.

I see that "A.M." in your issue for March 25th has difficulty with his engine stopping. I had a similar experience with a small single-cylindered car a short time back. It would run perfectly for some miles, and then, as if some heavy load had been put on the car, it would slow down and stop. At first I judged the piston seizing, and afterwards the back axle at fault, but it was subsequently found that the cause of the difficulty was the carburetter flooding. I would advise "A.M." to first see that this is in first-rate order before touching the electrical circuit. Of course, in this case, flooding the carburetter would only tend to make things worse. I would suspect the needle valve binding, and so erratically working.—H. LOMAS.

With reference to the frequently recurring complaint in your journal of misfiring in one cylinder of twin engines, possibly my experience may assist, at least, some of the querists. In the early part of last season I was troubled with intermittent misfiring in one cylinder of my 5 h.p. Peugeot twin engine. This occurred chiefly at any attempt to throttle. The inference was, of course, that the tension of the A.I. valve springs was at fault. I repeatedly adjusted these valves with the greatest of care, ascertaining on each occasion that the tension of springs, and the lift of each, was precisely similar; nevertheless, the annoying misfiring was still in evidence. Eventually I observed that the plunger in dome above the front inlet valve was in constant motion while the engine was running, and upon closer examination discovered that the spring of plunger had weakened considerably, and from constant vibration of plunger the hole through which it passes had worn abnormally large, thereby admitting a considerable quantity of air to that cylinder. Upon rectifying this the misfiring ceased at once, and the range of the throttle lever increased accordingly.—J. C. DANIELS.

"THE AUTOCAR" contains each week much interesting information which, although written in regard to motor cars, is also applicable to tricars and motor bicycles. It is published weekly, price 3d., and can be obtained from all newsagents and bookstalls



CURRENT CHAT
SPECIAL FEATURES
Experiences on Brooklands Track. Illustrated.
Motor Cycle Touring.
A Paper read by Mr. A. Candler before the members of the A.C.U.

Seven Medical Men in One Club.

It is interesting to note that there are at present seven doctors in the Great Yarmouth and District Motor Cycle Club.

The A.C.U. Chairman.

We regret to hear that the chairman of the A.C.U., Mr. Robert Todd, has been confined to his bed with a severe attack of bronchitis.

Dinners to Ripley Roadmenders.

The fund for the Ripley Roadmenders' dinners and entertainments has now reached a total of £17 5s. 9d. The third dinner was on Saturday last, at the Anchor Hotel, Ripley.

The Meet of Motor Cyclists at Richmond.

Two more clubs have arranged a run to Richmond, Yorks., on Good Friday, viz., the Scarborough M.C. and the York County M.C.C., making a total of nine clubs attending this inter-club meet.

The Brooklands Race.

It has now been decided that the first open motor cycle race at Brooklands will be contested on Easter Monday. The full list of entries will be found on another page of this issue.

Found by "The Motor Cycle."

Whilst a writer in a car paper and others are putting in similar claims, Cudham was undisputably "discovered" by our Southern correspondent. The first report of a trial and an illustration of the hill and description of same appeared in *The Motor Cycle* as far back as April, 1906. Other Cudham claimants please copy.

The April Fool's Day Trick.

Anent the April 1st 'bargain" referred to in these columns last week, we have since heard that the first telegram accepting the offer arrived a few minutes after 8 o'clock on the morning of publication of *The Motor Cycle*, and at 8.30 a man came with a van prepared to take the motor cycle away, then more telegrams, and by 11.30 a.m. twenty people had called with the money in their hands demanding the £20 bargain in motor cycles. Some of the would-be bargain buyers got very nasty, and one individual, who wanted to fight, said he came from Peckham. These quick results go to prove the demand for motor cycles, but we hope there will not be another April Fool's Day trick.

Infringing Patent Rights.

Like many another patented article the Watawata belt has not lacked imitations, and in France particularly Messrs. O. and W. Ormerod have had to take legal proceedings against parties for deliberate infringement of patent rights. Proceedings have just terminated in a judgment in favour of Messrs. Ormerod with substantial damages in two cases.

THE NEXT ISSUE.

IN consequence of the Easter Holidays "The Motor Cycle" for next week will be published one day later than usual, i.e., Thursday morning, instead of Wednesday.

Open Sesame.

The A.A. recently organised a little continental trip for Mr. Charles Jarrott and his motor car, and incidentally relieved him of all worry and trouble in connection with the shipping and unshipping of the car and "clearing" it through the Customs at Boulogne. The following is a copy of the telegram from the A.A. to Major Stevens, Gare Maritime, Boulogne: "Charles Jarrott and car AA 6000 arrive Boulogne first service April 2 *en route* Italy, wants clearance, permis circulation, but no license, make violent love French Customs, establish record, want eighty litres essence." We understand that on the day above-mentioned Mr. Jarrott was heading due South exactly four minutes from the moment the boat stopped at Boulogne Quay. The above is truly a princely and luxurious method of travel, and not at all compatible with our experience of cross-Channel passages. Motor cycles appear to be allowed to travel on sufferance, are usually relegated to the uttermost depths of the luggage deck, and no provision is made for slinging them unless a rough rope and two heavy iron hooks can be called such. However, we were not members of the A.A., and future experience may be more pleasurable when provided with the magic badge which ought to be supplemented with the letters O.S. (open Sesame).

Speed Limit on the Great North Road.

A ten miles speed limit will come into effect on Easter Monday in the parish of Colsterworth. The stretch of road to which the regulation applies extends from the junction of the Great North Road with the northern end of Back Lane, to the milestone indicating 102 miles from London.

A New Four-cylinder F.N.

What is to be known as the 1908½ pattern F.N. four-cylinder motor bicycle has made its appearance on the American market. The engine is a 5 h.p. compared with 4½ h.p. in 1907, a 20in. frame is used instead of a 22in., also a special ball bearing Bosch magneto, and heavier tread tyres.

Open Motor Cycle Hill-climbs.

Owing to the amount of inconvenience caused by competitors in open hill-climbs practising on a hill for days prior to the event, the committee of the A.C.U. has decided that it will not in future grant a permit to any club unless the following clause is inserted in the regulations: "Any competitor found practising on the hill prior to the competition will be disqualified from competing in the event, and his name will be submitted to the Auto Cycle Union."

Petrol Imports Fluctuate.

1,629,420 gallons of petroleum spirit were imported last month compared with 747,873 in March, 1907, and 3,613,431 gallons in 1906.

Imports of Motor Cycles.

Fewer motor cycles were imported last month as compared with 1906 and 1907, the 115 machines imported being valued at £2,998 and parts £2,614—£5,612. During the three months ended 31st March the imports reached a value of £17,190, as compared with £22,135 last year and £20,892 in 1906

The Exports.

Seventy-six British motor cycles were exported last month, which, together with parts, were valued at £4,321. The number exported from January 1st to March 31st was 184 this year, 173 in 1907, and 194 in 1906. Together with parts the total value of the three months British exports was

1906.	1907.	1908.
£12,442.	£14,448.	£13,229.

Add to above the exports of foreign motor cycles, and the figures are £13,965, £16,662, and £15,019 respectively.

The Motor Cycle Racing Outlook.

The most attractive item at a cycle race meet is a motor cycle race, and London sports promoters now seem alive to this fact, as we hear an increasing number of motor cycle events will be included in the principal London meetings this year.

Auto Cycle Union.

The next Quarterly Trial for motor cycles over the usual course will be held on Wednesday, April 29th. The annual open hill-climb will be held on May 16th, if possible in private grounds, and the secretary of the Union will be pleased to hear of any place suitable for the purpose.

The Motor Cyclists' Ideal.

The work of checking and tabulating the replies on the forms circulated with our issue of March 18th is proceeding apace, and very shortly we hope to publish the whole of the figures, which are sure to prove most interesting.

To Nottingham and District Motor Cyclists.

Reverting to our paragraph pointing out that Nottingham is one of the few large towns without a motor cycle club, Mr. E. G. Young writes that when he started one year ago it was a little too early. He is of opinion that there are plenty who would join a motor cycle club in Nottingham now, and is willing to give his heartiest support to any movement to form a club. Those riders interested would do well to communicate with Mr. Young. His address is Trent Bridge, Nottingham.

The Meet of Motor Cyclists at Richmond.

The following programme is in the hands of the Middlesbrough and District M.C.C.: 11 a.m., arrive Richmond, explore castle, etc; 12.45 p.m., conference with other clubs at Town Hall. Business, election of chairman and secretary for 1909 meet, selection of meeting place, etc. 1.30 p.m., official photograph for *The Motor Cycle* in Priory Grounds (if possible); 2 p.m., luncheon; 3 p.m., football match North v. South; 5.30 p.m., tea; 6.15 p.m., disperse for home.

Lightweight Motor Bicycle Trials.

The Automobile Club of Nice will hold a lightweight motor bicycle trial from the 25th to the 27th of April inclusive. The machines will be subjected to a trial on rough and mountainous roads, a speed trial on the flat, and a hill-climbing contest. The competition is open to motor cycles of any weight, and will be divided into two classes, one for single cylinder, the other for multi-cylinder machines. At the end of the trial competitors in each class will be placed in accordance with the total weight of machine and rider.

FUTURE EVENTS.

April 16-20—M.C.C. Easter Tour.
" 17—Inter-club Meet of Northern motor cyclists at Richmond, Yorks.
" 18 and 20—Brooklands Car and Motor Cycle Races.
" 19 (Easter Monday)—Lincolnshire M.C.C. Hill Climb.
" 22-28—Auto Cycle Club of France Reliability Trials.
" 25—Hertfordshire County A.C. Open Hill-climb for Motor Cycles.
" 29—A.C.U. Quarterly Trial.
May 2—M.C.C. Members' Hill-climb.
" 6—"The Motor Cycle" Special Spring Number
" 9—Brooklands Motor Races.
" 9—Essex M.C. Open Hill Climb.
" 16—A.C.U. Annual Hill Climb.
June 5-8—M.C.C. London-Edinburgh Run and return for Schulte Cup Competition, and special cup for motor bicyclists.
" 27—M.C.C. Inter-team Trials for "The Motor Cycle" Challenge Cup.
" ——A.C.U. 24 Hours' Ride.
July 4—Essex M.C. Open 200 Miles Non-stop Run.
" 13-18—A.C.U. Land's End to John-o'-Groat's Six Days' Reliability Trial.
" 25—Motor Cycling Club's Petrol Consumption Tests.
Aug. 3-4—M.C.C. Run from London to Land's End and Back for Charles Jarrott Cup.

The reliability test will be held on a course about twenty-five miles in length. The speed trial will be with a flying start, and for the hill-climbing contest competitors will have to cover a portion of the La Turbie (a formidable hill). Pedalling will not be permitted.

The 1908 London to Edinburgh Run.

In the preliminary announcement of the Motor Cycling Club's famous annual competition—the London to Edinburgh run—a copy of which has just reached us, one or two important alterations are to be found. In the first place, the entry fees have been raised. For the single journey to Edinburgh a fee of 10s. 6d. will be charged, but if it is desired to enter for the Schulte Cup or the M.C.C. Challenge Cup, or both, the sum of one guinea will be exacted. This has been done with the object of excluding those people who join the club simply and solely for this competition and leave other club events unsupported. Silver medals in place of certificates will be given this year to all who reach Edinburgh inside 30 hours. Mrs. Marshall, of the George Hotel, Grantham, has kindly decided to invite all the competitors to breakfast at her expense, and lastly, it has been arranged to start the two-wheeled machines first, the three-wheeled second, and lastly the four-wheeled vehicles — a really sensible arrangement. This year Mr. S. H. Fry is in charge of this important event.

Motor Legislation in Belgium.

A new Motor Act has been passed in Belgium, which provides that all cars must carry numbers front and rear, the latter to be illuminated at night, but this ruling does not apply to motor cycles. Another provision is that motor cyclists are allowed to use the byeways and tracks hitherto reserved for cyclists.

Meet of members of the Perth and District M.C.C., on the occasion of a speed judging competition.

MOTOR CYCLE TOURING.*

Mr. B. Chatterton took the chair, and introduced the lecturer, and remarked that Mr. Candler was one of the pioneers of motor cycle touring in this kingdom. Anyone who had the pleasure of touring with him would find him an excellent companion. Mr. Candler was a great man at seeing the sights and beauties of the country and meeting with all sorts of adventures, and would no doubt give a very interesting discourse on the experiences one has in touring on a motor cycle. (Cheers.)

Mr. Candler said that it was with great pleasure he had received the invitation from the Auto Cycle Union to come to address them on the important subject of motor cycle touring, and for the reason that he thought it a subject that had not been treated with the cordiality it deserved. He apologised for not following custom by submitting his remarks in the form of a paper, which they could have in their hands—a method which had its advantages, though it was desirable at times to have a change, and he would be less formal and more conversational. Some people liked walking tours. He knew a gentleman who used to go every year a tour round the coast, taking train to a certain part, and then following the coast line on foot, and in this way he toured the whole coast of Great Britain. The following year after completion he died. (Laughter.) Some people liked to take a train journey, say to Lucerne, by a very much-advertised five-guinea trip, with all its discomforts of railway compartments with ten persons, and arrive after a twenty-four hours' journey exhausted, stay about three or five days, and then come back home, having done Switzerland. Such a trip in ninety-nine out of a hundred cases will have done no good.

The Best Form of Holiday.

He thought the very best way a holiday could be enjoyed was any form of motor touring. He needed not to go into the doctor's argument—the way in which the quick passage of the air pumps oxygen into the lungs—it was too obvious; but, speaking seriously, there was a case on record of a doctor who was dying of consumption, and had about a month more to live, when a friend quite by accident took him for a drive of one hundred miles by motor. It did him so much good and made him so happy that his friend took him more drives, and, strangely enough, it seemed to be curing the disease. They kept up the treatment, and it is a positive fact that that gentleman was absolutely cured, and is now able to go back to his work again, and is still well. Motor touring was strongly to be commended.

Before one could go for a tour one must own a motor cycle, and he now came to a part of the subject which would lead to discussion—the proper type of machine for a motor cycle tour. For the moment he would leave aside patterns having sidecars and those horrible things called trailers, and would confine his remarks to motor bicycles. Undoubtedly we have a most perfect form of machine for touring, but he would go so far as to say that there is very little future for the motor cycle industry developed on the lines of creating those monsters capable of 52.4 miles per hour. The machine that is capable of doing that is not suitable for motor cycle touring, and clubs (probably the Auto Cycle Union) are to be blamed for not organising competitions which will cause manufacturers to make a machine which will be better for motor cycle touring. A two-speed gear is absolutely indispensable if you would have a motor cycle that will take you in any part of the country; and by two-speed gear he did not mean gears that would be capable of up to two hundred miles only before bursting up. Manufacturers are to be blamed for putting on the market two-speed gears that have not been thoroughly tested before getting into the hands of the public. All these things ought to be tested thousands of miles before being put on the market. This was the cause why so few tour and why few, considering the vast field there is, invest in a motor bicycle. It would be safe to say there are 300,000 people who could afford to buy a motor bicycle, if they could feel sure it was reasonably reliable and suitable for motor cycle touring. Well, one required a two-speed gear that is reliable and would stand 10,000 miles without spending money on repairing; a good clutch that would enable one to start again on any hill that one may stop on to admire the scenery. These things were essential to the proper article for touring. As things stand at present, the most suitable motor bicycle is the single-cylinder. Here (the speaker continued) he was on very debatable ground he kne but with regard to power he favoured a 3 to 3½ h.p. machine weighing at present about 140 lbs.

The Luggage Question.

With regard to luggage, every person has a differe opinion. Some people can go away with a tooth brus others want apparatus even to the extent of evening dr for dinner. It is very necessary to have a dust c mackintosh. It occupies small space, and keeps one dry stormy weather. Something else, indeed, was needed, a that is a suitable companion. Reverting to the questi previously dealt with casually—why do so few people tour the motor cycle, and why are there so few motor cycl seeing the potentialities are 300,000 people?—he thought t answer was because motor cycles made, say, six or sev years ago were so utterly unreliable, but motor cycles at t present day are made so that one can go big tours wi absolute certainty; in fact, with more certainty than peo could, twenty years ago, tour with an ordinary bicyc What a grand sport the public are missing. They frightened. He came across a man with a motor bicy years ago, and asked him, are these things any good? a the stranger replied that they were the biggest fraud of t century. (Laughter.) Of course, such things made l impressions. He had had the curiosity when touring to sou people, and they had told him they were frightened, t the things were so unreliable.

A Suggestion to Popularise the Motor Cycle

He wished he could hit on some plan to let people kn that things are not now what they were. He had thou that a band of amateurs might mount their machines, go a tour, say, from London to Land's End, about 100 miles day, stop at big towns, exhibit their machines, and lect and expound, so that the local papers took it up. It wo be a splendid thing for manufacturers. He spoke of amate because the general public have an idea that trials are m on a special cycle, and not on a stock machine.

But one of the most fascinating ways of learning geogra was by motor cycling tours. There were different ways touring, as all knew; some people preferred to take a ce and then go about 100 miles and come back to the s hotel. Another way is to start and do everything by r unless you cross the Channel; and for our own country did not think one could have a better three weeks' holi than by taking one of the routes—not the main roads, one of the circuitous routes of probably three times mileage—in order to see the pretty places. It is as wel pick out the pretty spots and make up one's mind to them.

Doing everything by motor is much more fascinating t taking a centre, and it is not a bad plan to do as some go a big distance, say to Moscow, and come back by t If one had three weeks or a month's holiday one might to Siberia and back.

Some people cannot get away in summer, and motor t ing in this country in winter, with its fogs and rain and and snow, is not the most enjoyable form of holiday mak but in a very few hours you can get into real summer twenty-four hours to Marseilles, another twenty-four N Africa. He would show anyone a way of doing that, sh anyone want to get away to North Africa for a mo There the roads were as fine as any in England or Fra The Swiss tour was, of course, a fascinating form of holi and one of the cheapest ways was to motor to the T Bridge and take the General Steam Navigation Co.'s boa Ostend (first-class return ticket 10s. 6d., bicycle ticket 6d.), and motor from Ostend to Belgium; thence to Swi land, touring there for a week, and coming back by a diffe route through France.

With regard to foreign touring, he thought people tour cannot be too careful. Countries judge nations by type of individuals they are accustomed to see.

He would give one little hint with regard to motor tou You must always make some arrangement with a compa where to meet in case you lost one another. He had k parties spoilt by one member taking a wrong road and l sight of his companions for the rest of the holiday. It also essential to make a note of your hotel.

In order to enjoy a motor cycle tour, it is essenti make up one's mind what one intends to do well in ad

* A lecture by Mr. A. Candler delivered before the members of the Auto Cycle Union on Friday, April 10th.

Motor Cycle Touring:—

of the tour. Study the locality, the people's habits, and anticipate the pleasures weeks before hand. Some people boast they do not make up their mind where they will go for a holiday until they get there, and the speaker thought that was courting disaster, especially with regard to a motor tour. Take a camera with you, and you will then have something to look back upon.

Touring Conditions Now and Seven Years Ago.

The facilities for touring now are very different from those of seven years ago when he began. Then one had to carry a little book to know where to buy petrol; places for recharging were two or three hundred miles apart. With the aid of the Auto Cycle Union and the Touring Club de France people need not be afraid of touring abroad or of the formalities attaching thereto. To the question, what is the good of visiting these places on a motor bicycle when one has visited them on an ordinary bicycle? he replied that one method is very different from the other. On a motor bicycle the panorama was different, and on an ordinary bicycle it would be necessary for him to carry half a dozen flannel shirts; on a motor bicycle one arrives at the end of a run fresh and cool and comfortable, even on the hottest day.

The motor cycle press gives valuable information as to tours, etc. It was pleasant on going over a familiar road to have one's memory called back to associations of various kinds. There was hardly a mile on some routes where he had not some association, pleasant or unpleasant, such as that his battery ran out here or his tyre burst there; and these memories are doubly pleasant nowadays, when motor bicycles are so very reliable.

On the point of the £ s. d. of motor cycling, he thought there would be much mixed talk. Roughly speaking, one could run, with decent luck, for ½d. per mile with a 3½ h.p. machine; in other words, enjoy 5,000 miles in a year for a £5 note.

Through the kindness of the Cycle Campers' Association he had some slides to show, illustrating how to enjoy more deeply still the fascinating holiday of touring. With a camping outfit one could tour at a cost of 15s. per week, with all the delightful freedom of open air life.

Before closing his remarks he would refer to the abuse of the sport, to which he was led by having his attention drawn to some motorists who, instead of spending their week-ends touring, race about with open exhaust.

Mr. Candler closed his lecture by reading an extract from Rudyard Kipling, to be found in the "Complete Motorist," by Filson Young, commencing: "But the chief end of my motor," etc.

[For the discussion, see next week's issue.]

FIRST MOTOR CYCLE RACE ON BROOKLANDS TRACK.

To be run on Easter Monday, April 20th.

For motor bicycles of which the engines, if twin-cylinder, do not exceed 80 mm. by 98 mm. for each cylinder. Distance, about five and a half miles.

List of Entrants.

Mr. W. W. Genn.	Mr. E. Kickham.
Mr. W. G. McMinnies.	Mr. J. B. Hanafin.
Mr. Guy Lee-Evans.	Mr. O. C. Godfrey.
Mr. H. Reed.	Mr. A. G. Reynolds.
Mr. W. Pollard.	Mr. O. L. Bickford.
Mr. W. H. Wells.	Mr. C. R. Collier.
Mr. Arthur G. Forster.	Mr. Cory Hurford.
Mr. Edwin Gwynne.	Mr. E. C. W. Fitzherbert.
Mr. W. H. Bashall.	Mr. H. Shanks.
Mr. G. Schink.	Mr. F. W. Applebee.
Mr. F. Toman.	Mr. H. A. Cooper.
Mr. H. A. Collier.	Lieut. J. C. Davis, R.N.

Twenty sovereigns or a cup to the entrant of the winner, at his option. Five sovereigns or a medal to the entrant of the second, at his option.

CLUB NEWS.

Worcestershire M.C.C.

Good Friday run to Stratford-on-Avon, meet 2.30 p.m. Easter Monday, reliability trial. Saturday, 25th inst., run to Malvern.

Falkirk and District M.C.C.

A motor cycle club called the Falkirk and District Motor Cycle Club was formed at Falkirk on the 9th inst. The Rev. Mr. Wright was elected president, Dr. Watt and Mr. Salvesen vice-presidents. Hon. secretary Dr. Shanks, hon. treasurer J. Borland. The club expects to number forty-two members.

Perth and District M.C.C.

The club held a very successful speed guessing competition on Saturday, April 11th, the route being Perth, Methven, Amulree, Dunkeld, Caputh, and Murthly, to Stanley. There were sixteen entrants, of whom thirteen completed the course. Those who finished within time limit in their order of merit were: W. J. Sommerville, J. A. Livingston, and R. S. Shaw (tied), C. Livingston, J. W. Robertson, J. P. Crichton, J. Adamson, G. A. Gibb, and W. G. Pople. The members afterwards had tea in White's Hotel, Stanley, and the whole run was much enjoyed.

Western District M.C. (London).

A most successful smoking concert was held at the Milford Hotel, Hounslow, on Thursday, the 9th inst., by the above club. There was a large attendance of members and their friends and a most enjoyable evening was spent. Some amusement was caused by a humorous programme drawn up by one of the members.

A speed-judging contest was held on the 11th inst., the course being from the thirteenth milestone on the Bath Road to Henley and finish at the Milford Hotel, Hounslow—a distance of forty-eight miles. The competitors had to run in pairs and finish together to qualify for a prize. A showery morning kept many away, and four pairs were dispatched on the journey. All finished close to the time allowed, and the winners proved to be Messrs. N. Hall and F. Ritchie, who were eight and a half minutes out. Heavy rain fell during the run. Members who wish to attend the Brooklands races are requested to meet at the Milford at 10 a.m. on Saturday, the 18th, and Monday, 20th.

The Hull and East Riding A.C.C.

The committee has arranged the opening run to take place on Easter Monday to Bridlington, where the members of the Scarborough Motor Club and the Sheffield and Hallamshire M.C. Clubs will be met at 1.30, and dinner partaken of at the Station Hotel.

Richmond, the venue of the Northern meet of motor cyclists, has also been put on the club's programme for Good Friday, and it is hoped that the attendance at both runs will be satisfactory. An enjoyable time is already assured on both occasions. The times of starting are: Richmond, 5.30 p.m. on Thursday, staying overnight at the Windmill Hotel, York, and 7 a.m. on Good Friday. Bridlington, 9.30 a.m. on Easter Monday, lunch at 1.30.

York will again be visited on Military Sunday, April 26th; dinner at 1.30 at the Windmill Hotel; start from Hull at 8 a.m.

All runs will start from Paragon Square (Soldiers' Monument). The club photograph will be taken before the start on Easter Monday. The committee will gladly welcome any visitors to these meets. The club membership is now 82.

Hampstead C. and M.C.

The opening meet and concert held on the 11th inst. at the Red Lion Hotel, High Barnet, proved a great success, eighty members and friends being present. Mr. C. Homan (captain) presided. An excellent programme was provided, and a most enjoyable evening was spent.

For Easter the club will make its headquarters at Ye Olde King's Head, Ivinghoe, near Tring, and impromptu runs will be held daily. April 25th, meet Tally Ho, Finchley, 4.30 p.m. prompt; destination, Hitchin. Tea at Hunt's Temperance Hotel. Hon. secretary, C. H. Cave, 3, High Street, Highgate, N.

Club News.—

The Burton-on-Trent and District M.C.C.

The opening run will be held on Good Friday, the start being from the headquarters, the George Hotel, at 2 p.m., and the afternoon will be spent at Dovedale. On Easter Monday there will be a run to Buxton, commencing at 10 a.m.

York County M.C.C.

This club is also taking part in the great inter-club run to Richmond on Good Friday, and a run has been arranged to Scarborough (Pavilion Hotel) for the 19th inst; meet City Square, nine o'clock.

Scarborough and District M.C.

On Good Friday the run is to Richmond, North Yorkshire, and on Easter Monday to Bridlington to meet the Hull and East Riding A.C.C. and the Sheffield and Hallamshire M.C.C. Lunch, Station Hotel, at 1.30. On Easter Tuesday afternoon the run is to Helmsley *viâ* Pickering. Tea at the Swan Hotel, Helmsley, at 4.30. A special prize has been promised for the member who heads the list for attending and completing official club runs during 1908.

Coventry M.C.

The Coventry to Holyhead run, which is being organised by the Coventry M.C., will take place on May 30th, starting from Coventry at 7 a.m. Legal limit must not be exceeded, and certificates will be awarded to all competitors who complete the distance in twelve hours. Checkers and marshals will be required at Shrewsbury, Llangollen, Menai, and Holyhead. Will any local motorists, who would be willing to help on that date, kindly communicate with the hon. sec., Mr. E. W. Walford, 18, Hertford Street, Coventry?

A run has been arranged to the Red Lion Hotel, Banbury, for Saturday, April 25th.

Edinburgh M.C.C. (Formerly Dunedin M.C.C.)

At the annual general meeting of the Dunedin M.C.C., it was resolved, in view of the geographical inaccuracy of the name, as well as for other local reasons, to change the title of the club to "The Edinburgh Motor Cycling Club." Mr. Campbell McGregor, 2, Greenhill Place, Edinburgh, was reappointed hon. secretary, with the S.C.U. official, Mr. A. Allan Hay, as his assistant. In view of nothing being settled definitely between the A.C.U. and the S.C.U., it was decided not to affiliate, but to wait till matters are settled at headquarters and then consider the question.

Lancashire M.C.C.

The general monthly meeting of the above club took place on the 2nd inst., Mr. F. H. Wilkinson in the chair. It was decided to alter the maximum engine dimensions of the 2½ h.p. class in the forthcoming hill-climb to 74 × 76 mm. It was also decided to include sidecars in the passenger class. The following new members were proposed and duly elected: J. Riley, G. Harrison, T. Hoghton, — Wilson, H. G. Bee, C. R. Brown, R. Jameson, A. Sykes, and W. Jackson, all of Preston. At the conclusion of the business the Rev. W. J. Sumner read a paper on "The History and Development of the Internal Combustion Engine."

S.E. Auto Cycle Association.

Motor cyclists in the S.E. district are invited to attend a mass meeting that is being called to-morrow (Thursday) evening at eight o'clock at the Green Man Hotel, Southend, on the Sevenoaks Road, when the new S.E. Auto Cycle Association will be formally inaugurated. The new body will especially safeguard the interests of motor cyclists in the S.E. district, and the programme and other interesting matters will be discussed. The nearest rail station to Southend is Beckenham Lane (S.E. and C. Railway), and it is within short walking distance of Catford.

The Liverpool M.C.

The committee has mapped out an Easter tour of about 400 miles, extending over four days (Friday, April 17th, to Monday, April 20th), and comprising some of the most beautiful places and scenery of North Wales. Working on the principle that a club tour should not be a speed event or mileage record, easy day stages of as near as possible ninety miles have been arranged, leaving ample time to enjoy to the fullest extent the great number of exquisitely beautiful spots and places of interest met *en route*. The stopping places for each night will be: Friday, Ludlow; Saturday, Aberystwyth; Sunday, Bettws-y-coed; Monday, Liverpool. Members intending to take part must notify the hon. secretary, E. L. Fehr, 22, Preeson's Row, Liverpool, at once.

Dublin and District M.C.C.

On Good Friday members meet at Steam Tram Station, Terenure, for run *viâ* Blessington to Baltinglass, at 11 a.m. On Saturday, April 18th, start from Donnybrook Bridge at 3 p.m., for three days' tour to Waterford and back. Members not going to Waterford will accompany the tourists as far as Ashford, Co. Wicklow. Monday, April 20th, meet at Gough Monument, Phœnix Park, at 11 a.m., for run to Navan and Kells.

Newcastle and District M.C.C.

For the opening run to Richmond on Good Friday, members will meet at Coach and Horses Inn, between Low Fell and Birthy 9 a.m. On Saturday, April 25th, there will be a slow hill-climb on Benton Bank, Armstrong Bridge, Newcastle. Three classes will be included—First, for single-geared machines (minimum gear 6 to 1); second, variable gears; third, passenger machines. Entry fee, 1s. Start at 3 p.m. No pedalling allowed.

Cheltenham and District M.C.C.

At a general meeting held on Thursday last, it was unanimously decided to affiliate to the A.C.U. conditionally that the A.C.U. accept all responsibility of cancelling the old No. 2 agreement.

The opening run will be held on Good Friday; meet at the Lansdown at 11 a.m. Tea at the Belle Vue Hotel, Malvern. All motor cyclists are cordially invited.

A speed-judging competiton will be held early in May.

Motor cyclists desirous of joining should write to the hon. secretary, Mr. H. A. Cooke, 274, High Street, Cheltenham.

Cambridgeshire M.C.C.

The opening run is fixed for Good Friday to the Hardwicke Arms, Arrington (on the old North Road), where a photograph will be taken. Meet at headquarters at 9.30 a.m.

The following fixtures have also been arranged: April 23rd headquarters, at three o'clock, for Chequers, Royston; April 25th, headquarters, at three o'clock, for Swan, Linton; April 26th, Victoria Bridge, at 10 a.m., for Bell, Ely; April 30th headquarters, at three o'clock, for George, Huntingdon; May 3rd, Stone Bridge, at 10 a.m., for Saffron Walden.

The secretary, Mr. C. W. Wilson, 38, Victoria Park, Chesterton, Cambs., will be glad to receive the names of any motor cyclists wishing to join the above club.

Essex M.C.

A tour has been arranged for the Easter holidays, the venue being Southsea. Members will meet at 10.30 on Friday morning at Putney Bridge (Surrey side), and will then travel to Southsea, where the headquarters for the tour will be Miller's Hotel. Runs will be arranged to the surrounding places of interest. Mr. G. E. Revill will have charge of the tour, and will be pleased to receive suggestions from members taking part. Will those who intend to join please communicate with the captain, Mr. O. L. Summers, Southernhay, Loughton, Essex, so that accommodation can be booked. For those who are unable to get away before Saturday, a late party has arranged to travel down in the afternoon. It is hoped that a large number of members will endeavour to join, as a very enjoyable and interesting time is looked forward to.

Dundee and District M.C.C.

The following office bearers were appointed at the recent annual general meeting of the club: James S. Greig, president; vice-president, W. M. MacLean; captain, D. C. Forrester; vice-captain, W. S. Yeaman; secretary and treasurer, J. D. Cruickshank, 27, Albert Street, Dundee; members of committee, Messrs. G. D. Macdougald, G. Norrie, J. M. Ferrier, J. R. Hendry, E. D. Scott, and A. Bellefontaine. A hearty vote of thanks was passed to Mr. G. D. Macdougald, the retiring president, for the great assistance he had given the club and the able way he had carried out the duties of his office during the past year.

The opening run will take place on April 27th (spring holiday), starting from the headquarters of the club (Messrs. Maxwell, Son, and Co.'s Garage, St. Andrew Street), at ten o'clock, proceeding by Arbroath and Montrose to Brechin, where lunch will be arranged for two o'clock, at the Commercial Hotel. After lunch a photograph will be taken. The route home will be by Kirriemuir and Forfar. All motor cyclists are cordially invited to join in the run. Those intending to do so might notify the secretary not later than the 23rd inst., so that final arrangements may be made for lunch

The Motor Cycling Club Rules for the Inter-Club Team Trial, 1908, for "The Motor Cycle" 50 Guineas Challenge Cup, under A.C.U. Rules, Saturday, June 27th.

RULES.

This cup is a challenge trophy, entitled *The Motor Cycle* Challenge Cup, of which the Motor Cycling Club, Ltd., trustees and administrators.

It is to be the award in a competition between teams riders, members of, and nominated by, recognised automobile clubs, motor cycling clubs, or cycling clubs. In case of dispute as to whether any entrant is or is not a "recognised" club, the editor of *The Motor Cycle* shall adjudicate. No club may enter more than one team.

If the cup be won three times, not necessarily in succession, by the team representing any one club, it shall become the absolute property of that club.

Each team shall consist of six riders, of whom

(a) Four shall drive single-seated motor cycles.

(b) Two at least of the four single-seated motor cycles must be motor bicycles.

(c) Two shall drive a two-seated motor cycle, motor cycle with passenger attachment, such as tricar or sidecar, quadcar, or bicycle and trailer. A passenger must be carried, who shall not leave his seat during any part of the competition, and the joint weight of driver and passenger must not be less than 18 stones.

The competition shall consist of a 100 miles non-stop run—two stages of 25 miles out and home—with a lunch interval of one hour after fifty miles.

The number of miles, up to 100, accomplished by each rider of each team without stoppage other than during the lunch interval, or stoppages due to the exigencies of traffic, or a dismount at the end of the outward journey for the purpose of turning the machine, will be added together, and the team scoring the highest mileage thus arrived at shall be the winner. Unavoidable stoppages due to traffic must be reported, and will not count against the rider. No adjustments are permissible during any such stop.

No adjustments of any kind may be made during the lunch interval. No oiling or replenishments will be permitted during this interval.

A period of not less than one hour and twenty minutes, not more than one hour and thirty minutes must be occupied over each section of twenty-five miles; transgression of this rule will disqualify the rider from scoring on that section. These times apply to the distance as given on the map and route card, which distance must be taken as correct for the purpose of this competition.

The competition will take place on Saturday, June 27th, starting at 10 a.m.

The entry fee shall be two guineas per team.

Clubs must send an entry form, duly filled in, together with the entrance fee, to Mr. J. Van Hooydonk, assistant trials-hon. sec., the Motor Cycling Club, Ltd., "Spring Villa," North Finchley, N., on or before June 20th.

The judges shall be three in number, one nominated by the donors, one by the Motor Cycling Club, Ltd., and one by the Auto Cycle Union. None of these shall be a member of any competing club, and their decision shall be absolute and without appeal.

In the case of a tie between two or more teams the contest shall be decided in the following manner:

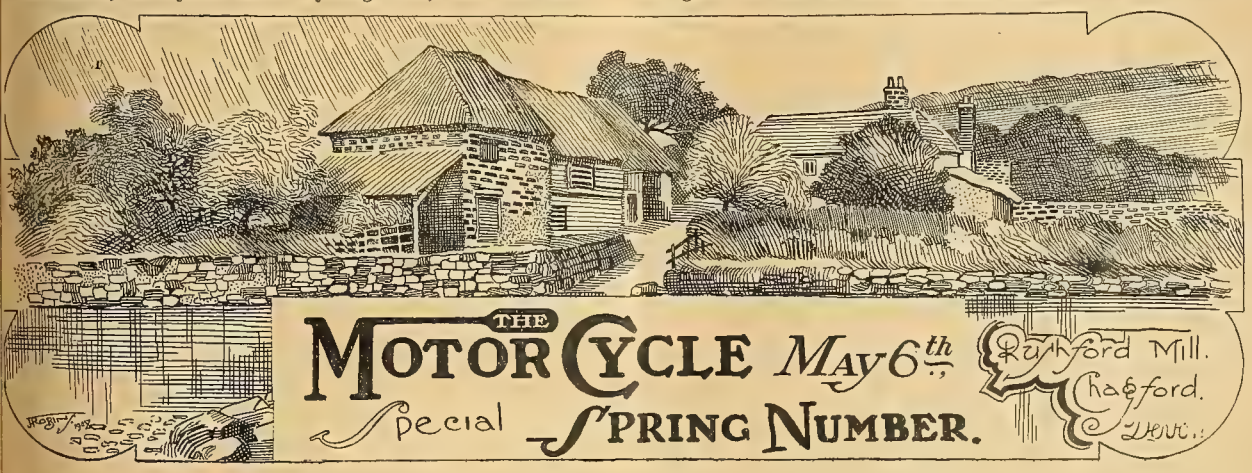
After an interval of one hour from the conclusion of the hundred miles—during which time no adjustments or alterations shall be made—the competitors who have finished this distance and are declared qualified under the rules, shall proceed to a fairly level stretch of road not far from the original starting point. On this an out and home course of approximately half a mile each way will be chosen, and marshals shall be placed at every 220 yards. At each such point, and at the turn, the road wheels of the machine must be brought to a complete stop and then re-started. At each stopping place the machine must be stopped between two lines drawn across the road ten yards apart, and so soon as the road wheels are at rest to the satisfaction of the marshal, the competitor may immediately restart and proceed to the next stopping place. The time will be taken from the word "Go" at the starting point, which will be the signal for the rider to start his engine, and the moment the machine returns to that point. The team whose six combined times amount to least shall win.

The committee reserve the right to refuse any entry.

Should it be deemed advisable in the interest of the competition, these regulations may be revised or added to by the Committee of the Motor Cycling Club, Ltd.

The Motor Cycling Club, Ltd., shall not be held liable for any damages caused accidentally or otherwise to the competitors' machines whilst in charge of the officials of the Club.

We recently had an excellent opportunity for a test of the new Shamrock-Gloria rubber studded tyres, a pair having been sent us by the Hanover Rubber Co., 29-31, Old Street, E.C. The covers have been on one of our machines for about three weeks, during which time the distance travelled, excluding the test runs carried out by the makers of the machine, is 306 miles. Most of this has been on partly dry roads, but recently the roads in Derbyshire were extremely heavy and greasy, and every motor cyclist who has ridden in the neighbourhood of Ashbourne will agree that, although not of the slimiest description, the roads in that district require a fair amount of care to enable corners to be negotiated with safety when the surface is wet. Well, the Shamrock-Glorias stood the test beautifully. We never had a moment's fear of side-slip, whether on greasy macadam or the tramlines of Derbyshire's county town. We are not surprised to hear from the makers that the new tyres are "going well." The wear on the rubber studs is, of course, not noticeable in such a short distance, but if looks count for anything, the studs are good for two to three thousand miles.



The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addresssed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C. and should be accompanied by the writer's full name and addres

Cleaning Out Carburetters.

[3239.]—*Re* your Wiltshire correspondent's letter as to the contents of his carburetter (?), did he mean his household dustbin or the ordinary motor cycle carburetter? as I should like to be quite clear on the matter. R. SURRIDGE.

The Prevention of Punctures.

[3240.]—I was very much interested in seeing Mr. Anderson's letter [No. 3183] in *The Motor Cycle* of March 18th *re* the prevention of punctures. I have had a similar experience during the two years I have ridden a motor cycle, and could never account for it, except that it was good luck. I have only had one puncture in the rear wheel and none in the front one. I always ride with a leather flap fixed to the mudguard of front wheel, which just touches the ground when the machine is at a standstill, and when in motion clears the ground by about a quarter of an inch.

Perhaps some more of your readers could give their experiences with a flap fitted in the above manner.

STAOCTLAS.

[The tip is strongly advocated by experienced cyclists, and there is no doubt it prevents punctures to some extent.—ED.]

The Future of Motor Cycling.

[3241.]—Were it not for the tone adopted by Mr. W. H. Wells in his letter, I would not worry your readers with a reply, for it can be of but little interest whether Mr. Wells agrees with my views or not. The statement that someone possibly may take me seriously is uncalled for, and should not have been made by one in Mr. Wells's position. I have frequently in your pages expressed my ideas on motor cycle matters in general, and always has this been with a belief that I was doing something to further the movement, or giving someone the benefit of a long experience. In many cases I have had the pleasure of receiving thanks from those who have profited by my advice. I have seen many letters from Mr. Wells, but I cannot recall to mind a single instance in which he has even attempted to help the movement in general.

To take Mr. Wells's letter, in the first place he accuses me of "expressing my opinion very frequently of late in *The Motor Cycle* in regard to the relative merits of light and heavy machines." This is entirely incorrect. The fact is that at Mr. Bell's lecture at the A.C.U. I took part in the discussion. *The Motor Cycle* questioned a statement of mine, and I replied to the criticism, but outside this not in a single instance, for the last year at any rate, have I written on the subject of light *v.* heavy weight.

Secondly, Mr. Wells thinks that having not been an active rider of the two-wheeler for some time, I am not in a position to have any ideas on the matter. As is well known, I am constantly out on the road with motor cyclists, and can at least form my own opinion as to the types of machines on which they appear to be most happy. According to Mr. Wells's ideas, those responsible for the Licensing Bill should spend their time in public-houses!

Thirdly, Mr. Wells does not think I am qualified to express an unbiassed opinion. My only reply to this is that in favouring the lightweight I am favouring a type of machine which my company is not manufacturing, and in these circumstances it is difficult to see how I can be biassed, whereas Mr. Wells is responsible for the selling of a heavy-weight machine, and loses not a single opportunity, so far as I can see, to tell us what a good thing he is on.

J. VAN HOOYDONK.

Two-speed Gears and Free Engine Clutches.

[3242.]—Having used a two-speed gear for over one th sand miles, in all weathers, with a sidecar, may I add following summary to the gear discussion?

DISADVANTAGES.

1. Low gears are very noisy.
2. The free engine, if kept going too long, overheats machine.
3. They are expensive.
4. They do away with the healthful exercise of run alongside the machine and hard pedalling, which restore circulation in winter.
5. They annoy owners of cars by passing them on s hills.
6. They cause undue wear on the machine by inducing to go out on muddy roads when otherwise it would be not to ride.
7. They cause fat old gentlemen, who ought to b better, to career about on motor cycles. There is one suc the district weighing over twenty stones, who strolls ar on a 4 h.p. Roc looking the picture of unblushing enjoyn
8. They promote the pernicious sport of motor cyclir a terrible extent.
9. They sometimes require oiling and adjusting.
10.—They take away all excuse for detaching your si from the bicycle. People find out what a gear means want to come too.

ADVANTAGES.

Nil.

MOHUN A. TRENCHAR

Lessons from the Lewisham A.C. Hill Climb.

[3243.]—As an interested spectator of the hill-climb Cudham, one feels constrained to offer the management h congratulations on the way the event was carried throug spite of police opposition at the last moment.

As a sportsman, one hopes that a similar method to employed on Saturday, the 4th inst., may become the and not the exception, namely, that competitors are not of venue till, say, an hour or two before the climb takes

As a believer in the future of the lightweight, one disappointed in the number of entrants in this class. results, however, were interesting, and personally I was struck with the performance of the 2½ h.p. Fairy, whicl the only machine to take the hill without hard peda The rider, however, appeared to be somewhat nervous a have upset his mixture, as shortly after the event he me coming up at a much higher speed and without th of pedals. I for one am pleased to see English ma coming to the front, as I consider the foreign machines had it too much their own way in this class heretofore.

There are two points which appear to be of great in to the sport, namely, that in future events stress shou laid on the fact that machines must be standard touring in every respect (no special carburetter or other device) that the amount of pedalling should be taken into accou the final placing of the machines, as the general public to know the actual merits of the machine, not the behind the pedal.

If these points were attended to these events would be more in the spirit of the old sporting days, where man had a fair chance. J. ASHMO

The Balancing of Petrol Engines.

[3244.]—I was much interested in the letter of "Shazzik" on the above subject in *The Motor Cycle*. Might I ask him to send you a diagram with position of drilled holes, size, and number in each flywheel? Also what method he uses in testing the balance. Perhaps he would also give us experience and advice on preventing the blowing out of oil at the pulley bearing? While I have the engine down could he advise drilling, say, an ⅛in. hole up the spindle to relieve pressure in crank chamber? KERRY.

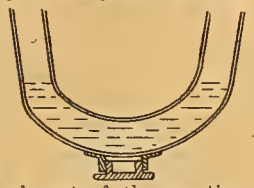
Low Petrol Consumption.

[3245.]—I ride a little old Peugeot with a surface carburetter, and as I am fast drawing towards the sere and yellow, have a forecarriage attachment minus the seat. On Wednesday week I had a journey of seventeen and a half miles each way, and road conditions and weather being favourable, I was not altogether surprised to find the machine running all the way with the throttle nearly closed. Before starting I put one quart of Carless into a perfectly empty tank, and, on arriving home I drew therefrom a pint, less about a sixth. This works out at about thirty miles to the pint, or 240 to the gallon. If this is not a record it cannot be far behind.

E 123.

Exclusion of Dust.

[3246.]—I agree with the conclusions of your engineering friend and yourself as to the difficulty of satisfactorily excluding dust by means of gauze. But I have an idea that the problem might be attacked by drawing the fixed air supply through a U tube with a water tap, and the extra air through a long intake tube lined with a removable flannel sleeve soaked in, say, glycerine and water.



In nature, the filtration of dust particles in the air is provided for by hairs in the nostrils. My idea is to imitate this somewhat. Of course, absolutely perfect filtration is out of the question. Our long-suffering lungs (as well as carburetters and cylinders) are full of dust, especially behind a big car on a summer day, but perhaps something might be done on the lines above indicated. I mention glycerine because it would remain moist (just the opposite of ether), and would arrest the fine particles somewhat, as in nature. Of course, the existing balance of the carburetter would be altogether upset, and my suggestions may be impracticable, but such as they are I venture to lay them before you. OLD COLONIST.

Handle-bar Control.

[3247.]—Your correspondent, Mr. Mohun A. Trenchard, in his amusing narration of his numerical progression in h.p. in your issue of 25th March, bemoans his inability to secure, among other improvements, handle-bar control, owing, as he puts it, to "fortunate lack of funds."

We would like to point out, however, that handle-bar control, if fitted in the first instance, involves little, if any, additional expense, and practically every up-to-date motor cycle builder now offers this very essential improvement as part of the standard specification.

There are hardly two opinions nowadays about the overwhelming advantages of handle-bar control, and we would recommend your readers to take an opportunity, before placing their orders, of inspecting some of the best systems, such as those of the Aston Motor Accessories Company, Messrs. Brown and Barlow, and that supplied by ourselves, or to examine some high-class machine so fitted, such as the Triumph. On going into figures when selecting the mount will probably be found that handle-bar control is no dearer and an less efficient systems.

We find that many of the smaller makers endeavour to dissuade buyers from adopting handle-bar control; the reason being, we believe, that such makers are ignorant of the ease with which it may be fitted when building the machine. If buyers would only insist upon having what they want in such cases they would benefit themselves and do the maker a good turn by making him keep abreast of the times.

E. M. BOWDEN'S PATENTS SYNDICATE, LTD.

Two-speed Gears and Free Engine Clutches.

[3248.]—I am one of the large number of motor cyclists who desire to buy a powerful twin motor cycle for use with sidecar and real touring. From five years of motor cycling in hilly districts in Wales, Derbyshire, Lake District, etc., I know that no single-geared machine can give satisfaction for such work, especially when the passenger is a lady, whom one does not take out for a tour and then ask her to help to push a heavy machine up some very steep road, which, on account of its right-angle or hairpin bends, the machine cannot surmount.

I, therefore, amongst many others, am anxiously looking for the public trials of standard makes of heavy twins fitted with two-speed gears, and I was exceedingly pleased to see that A. W. Wall, Ltd., are offering their machine and gear for such a searching test, viz., descending a hill like Birdlip partly, and at one of the steepest portions turn round with engine running, and then reascend the hill. Such work is sometimes required of motors whilst on tour, where hairpin bends are numerous, and I sincerely hope that Mr. Wall's very brave offer will be accepted by the A.C.U., and that at the next hill-climb a class for passenger machines with two-speed gears may be arranged. If necessary, makers of such gears should be specially invited to take part, and asked to put their gears through such a test. The only thing I wish to very specially emphasise is that the tests be carried out with passenger, *i.e.*, not with solo machines, which latter, if well handled, could perform such a feat even on a flexible single-geared machine. E. KORBER.

The Motor Cyclists' Ideal.

[3249.]—*Re* letter [3206] from "A Prospective Buyer." This correspondent does not state what price he would call a fair one for his ideal machine. Personally, I do not understand why the motor cycle firms do not try and cater for the different wants of the prospective buyer, and the prices asked in the different advertisements seem to be veritable armour plates, placed to effectually stop ordinary buyers from anything but a second-hand crock. Now I am not a motor manufacturer, but possess sufficient plant to turn out motors. The question then remains, Would this writer accept a machine built by me if it were to come up to his specification? Why ask the Rex Co. to do all the work in the world? Up to the present time they have always made heavy machines—that is, in my opinion. I should call a light one, say, under 60 lbs.

Why not try something like the following? No pedals, magneto, low saddle, variable gear, automatic carburetter, narrow tanks, spring forks, cycle roadster tyres, low engine power, wind screens for efficient cooling—or instead of variable gear have Mabon free-engine clutch; weight under 70 lbs., say 65. How would this suit at £25? (Engine about 2½ h.p.)

WASHINGTON LOWE.

[3250.]—There will never be a machine designed to suit all classes of riders, and I believe this fact is already well recognised by the trade.

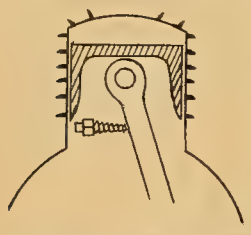
No doubt, a machine of about 3 h.p. with an efficient two-speed gear and weighing not more than, say, 110 lbs., price £30 to £35, would appeal to thousands of riders; but we shall have to wait some years before such a machine can be produced.

I belong to that large and growing class—referred to by "Ixion"—of rider who, having tasted the joy and comfort of driving a well tuned twin, will never go back to the single-cylinder again. Further, it has now been conclusively proved that for sidecar work a twin is an absolute necessity; that is, for touring purposes. Personally, I find it requires more energy to push and start my single-cylinder 3 h.p. mount than my twin heavyweight, with free engine. In fact, during the past year I have never been fatigued in the least handling a machine over 200 lbs. weight.

I should imagine that any machine under 100 lbs. in weight would be a most uncomfortable mount for touring purposes, even if capable of taking most hills, as on rough roads the vibration would be felt very much more than on a heavyweight. When we have reached perfection I think the "ideal" motor cycle will have four cylinders, ensuring a slow running engine, and, consequently, no wear of parts, noiseless, vibrationless, pedalless, two-speed gear, and the weight may probably be cut down to 160 lbs. H. GIBSON.

Experiences with Gudgeon Pin Set Screws.

[3251.]—The strange experience with gudgeon pin set-screw described by "Ixion" is remarkable, to say the least of it.



He does not tell us which side of the cylinder the pin came out of. If the front, the explanation, I think, is simple. The piston had just gone down on explosion stroke, and the gudgeon pin screw must have just dropped out as the piston came up again. When the piston reached the top on exhaust, the connecting rod swung across and the pin was trapped in a horizontal position between the wall of the cylinder and the connecting rod. This would have quite sufficient force to drive it through the wall of the cylinder. I append a rough sketch to show my meaning. I shall be interested to know what "Ixion" thinks of this explanation. When mine dropped it took the complete top of the crank chamber with it.

A. F. PAYNE.

The A.C.U. Annual Council Meeting.

[5352.]—In reading the report of the above, I was particularly struck by the lack of judgment evinced in the selection of the committee. I see there were twenty-three clubs nominated for representation, of which three had of necessity to be rejected. On referring to the *Journal* and the M.U. report, wherein is given a list of clubs and membership affiliated under the standard agreement No. 2, I see that of the three rejected clubs one has a membership which is only exceeded by three other clubs, and another of the rejected clubs has a greater membership than seven clubs which are to be represented. Then, again, of the twenty elected clubs, there are five which are not quoted in the *Journal* or M.U. report, and are presumably clubs recently affiliated.

Is it reasonable to expect clubs with a fairly large membership to be governed by the small clubs, or the older affiliated clubs by those newly affiliated?

I observe from the report in the *R.A.C. Journal* a question was raised as to a member of the A.C.U. committee being on the sub-committee formed by the M.U. for the purpose of enquiring into the position of motor cyclists, but a *club* which has signed the new Motor Union agreement has been elected for representation on the committee of the Auto Cycle Union.

H. W. BEECH.

Running on Petrol and Paraffin in Burmah.

[3253.]—I have been trying paraffin and petrol (one of the former and seven of the latter) on a Rex with surface carburetter, and I find that the results are not worth the trouble. The machine ran all right when at a certain heat, but if worked hard caused preignition through points of plug becoming too hot. I have run three miles all out and then switched off, and the bicycle has travelled merrily until the exhaust valve was raised. I could never open the air lever at all with this mixture, whereas with Pratt's petrol only I open it halfway to start, and with Shell petrol threequarters open and hardly any throttle on at all, and when the machine is well under way the air can be turned full on, and no more throttle required.

In conclusion, I think that the paraffin and petrol could be used on a cooler pattern of engine *i.e.*, water-cooled or with a good fan, and that extra power would be obtained. With surface carburetter it is difficult to keep mixture correct, as it does not vaporise so well as petrol, and, therefore, is not suitable for this kind of machine.

C. A. HOLLAND
(Artillery Sergeant).
Burmah.

Motor Cycle Actual Weights.

[3254.]—With reference to a letter by "Road Sweeper" in a recent issue, I am glad to see his remarks on the subject of actual weights. I recently purchased a new 5 h.p. twin by one of the best makers with the firm's own belt-driven two-speed gear. This two-speed model is listed in your Buyers' Guide at 204 lbs. What portion of the machine this refers to I do not know. Its actual riding weight, from the mean of two careful tests on different weighing machines, is 270 lbs. This includes lamp, horn, luggage carrier, toolbag with a few spares, some petrol and oil, a total of 20 lbs., all of which, except the Goodrich bands and lamp, it is absolutely necessary to carry everywhere.

The consequent advantage gained over a well-known 3½ h.p. weighing 170 lbs. with 10 stone rider is only 6.5 lbs. per horse-power in favour of the twin, and this is probably absorbed by the slight extra friction due to the two-speed gear. The actual gain is an ability to climb perhaps half a dozen hills in England, which I do not live anywhere near, with the aid of the two-speed gear, and, on the other hand, I carry about 100 lbs. extra, with its attendant disadvantages and expense.

My idea in getting the twin was that it would make a practically go anywhere machine with sidecar and passenger, but so far as I can judge from a few trials in this easy country, I have gained nothing in this direction except the two-speed gear, which has to be called into play on hills which the 3½ h.p. single-geared used to take the sidecar up pretty easily.

From Mr. A. G. Lee's interesting formulæ, I gather that against a wind velocity of fifteen miles per hour (this is in nautical language a fresh breeze) the combination, weighing 612 lbs. and expressing an area of 13 sq. ft., would require 4.98 h.p. to travel on the level at fifteen miles per hour.

In practice the engine will not give this horse-power continuously, and it cannot be got out of the engine at the number of revolutions per minute which this speed represents on a gear of, say, 5½ to 1, so really it means the low gear on the level under these conditions, and a hill of anything over 1 in 12 will probably stop you even on the low gear against this fresh breeze. It looks as if the combination were little better than some sailing boats I have met, and will only make a passage with a fair wind.

STEAM ROLLER.

The Selection of Gear Ratio and Other Items.

[3255.]—I have been reading with intense interest the articles by Mr. A. G. Lee on "The Selection of Gear Ratios," and so have, I doubt not, every other motor cyclist (and very likely car driver) who has ever climbed a hill.

The publication of articles like the afore-mentioned ("Be Efficiencies," "Hints and Tips," etc.), technical though the look, are far more interesting than accounts of travels, stories and so on, and they make the paper *(The Motor Cycle)* what is called a "live" paper.

There is one thing Mr. Lee has not worked out, and which I would like to see, although a good idea may be got by studying diagrams figs. 4 and 5 together. It is this. What would be the final speed of a variable pulley having, say, a dozen speeds (or gear ratios) which may be dropped step by step to meet the load obtaining at any particular part of the gradient, keeping the engine revolutions constant? It is a sure thing that it would be higher than shown in fig 4, and the average speed considerably so. The curve would probably be represented by a line sloping from thirty miles at 0 yards to twenty-five miles at 500 yards.

With regard to the curious accident of a gudgeon set-screw being pushed through cylinder wall, my theory is this, that it was pushed through by connecting rod. If there is a splash plate on top of the crankcase the screw would drop down on to it and through vibration would lodge in slot for connecting rod. On down stroke angularity of rod would jam against the cylinder wall, and increasing angularity of rod as the stroke proceeded would exert a powerful push, the flywheels supplying the power. If the correspondents on the subject will examine the edges of the connecting rod they will probably find a dent in it.

As to fixing of gudgeon pin, has the dodge ever been tried of drilling to centre of gudgeon pin and tapping through lug and pin? If the set-screw is taper pointed a little longer than usual, it will bring the gudgeon hole to register (supposing the parts were being reassembled after having been taken down) and would enter all right. The pressure on the point of set-screw, first on one side and then the other, which tends to make it work out would act as a lock on the threaded parts of the set-screw in the lug and pin respectively.

K 873.

[We believe the above described method of fitting gudgeon pin screws has been used. "K 873" may be correct in his surmise regarding the curious accident; see Mr. A. Payne's letter and sketch published on this page.—Ed.]

LEWISHAM A.C. OPEN HILL CLIMB.

"The STAR performance was undoubtedly that of the lightweight

'FAIRY,'

which sailed up with a few touches of the pedals."—"The Motor."

ORDER WITHOUT DELAY.

Another convincing proof of the capabilities of the popular "FAIRY."

THE FAIRY MOTOR CO.,

WESTCOMBE HILL, BLACKHEATH, S.E.

THE BELT THAT GRIPS.

The Watawata has a tenacity of grip to which other motor cycle belts are strangers.

That means power economy.

The Watawata is constructed solely of leather, and on scientific principles.

That means durability.

The Watawata is made in such a way as to render stretching or giving almost impossible.

That means a saving in trouble.

The Watawata is potent in the prevention of power wastage, so that the force of your engine is always rightly and fully directed.

That's why every motor cyclist can achieve better results with the Watawata, and why every reader of these words should test it.

A BOOKLET TO INTEREST EVERY MOTOR CYCLIST IS SENT ON APPLICATION TO O. & W. ORMEROD, Ltd., Dept. B, ROCHDALE.

LONDON: W. B. BROOKE, 318, KING STREET, HAMMER-SMITH, W.

In answering either of these advertisements it is desirable that you mention "The Motor Cycle."

MISCELLANEOUS ADVERTISEMENTS.

IMPORTANT NOTICE

Owing to the Holidays, Advertisements for our issue of the 22nd inst. must reach Coventry not later than first post on Thursday, 16th inst., to ensure insertion.

PRICES.

ADVERTISEMENTS in these columns—1d. per word, minimum 1s. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, on the Friday morning, or if sent to London, by the Thursday afternoon previous to the date of publication.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at *The Motor Cycle* Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed "No. ooo, c/o *The Motor Cycle*, Coventry," or if "London" is added to the address, then to the number given, c/o *The Motor Cycle*, 20, Tudor St., E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with *The Motor Cycle*, both parties are advised of this receipt, and upon intimation of the arrival and acceptance of the goods, the money is forwarded less a charge of 1s. for registration. The time allowed for a decision after receipt of the goods is three days. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

MOTOR BICYCLES FOR SALE.

HALIFAX Motor Exchange.—Careful consideration of the following will be to your advantage: Why live in this miserable world and potter along on that thumping, perspiring, overheating, and overworked single-cylinder, when you can get a fine twin Rex (a maker's triumph and the result of many years' experience), with long low frame, long bars, spring forks, and good tyres, in fact, a gentleman amongst paupers in most company, for the modest sum of £22, or we allow you a liberal sum for your old mount in part payment. Note the liberal terms of exchange; £16 for 1906 Rex, £13 for 1905 Rex, £11 10s. for 1904 Rex, or £10 10s. for 1903 Rex.—Halifax.

HALIFAX.—2¾ h.p. Minerva, mechanical valves, 26 wheels, 2¼ tyres, perfect order and condition; £14 10s.

HALIFAX.—3½ h.p. Minerva, spray, girder forks, 26 by 2¼ Clincher A Won, begging at £16 10s.

HALIFAX.—Fine 3½ h.p. Rex, long bars, low saddle, good climber; £11 10s., bargain.

HALIFAX.—Genuine Twin Rex, £22, guaranteed, spring forks, low built, goes like a flash; £16 given for 1906 Rex, £13 for 1905 Rex, £11 10s. for 1904 Rex, or £10 10s. for 1903 Rex in part payment.

HALIFAX Motor Exchange.—Cash, exchange, or extended payments. High-grade machines purchased for spot cash.—16, Westgate, Halifax. Telephone, 766. Telegrams, Perfection. Open Easter Holidays.

week is HERE!

WANTED, Roc, Phelon, or two-speed motor cycle, also sidecar.—Jarman, Torridge, Torquay.

WANTED.

WANTED, Rex engine, 3½ h.p., exchange good trailer.—A. Covell, 16, Monson Road, Redhill.

1904 Rex front forks and wheel wanted, for cash.—Simpson, 84, Loughrigg Street, Bradford.

WANTED, Vulcaniser, for repair shop, one of the latest.—Chauffeur, Cheadle Royal, Cheadle.

PALMER Cover, Clincher, 28 by 2½, good condition, wanted.—Newman, Sylvester Street, Sheffield.

WANTED, Forecar Attachment for cash; cheap.—F.G., 22, Ingrave Street, Battersea, London.

SIDECAR, rigid, 26in. wheel, left, good fit twin Rex.—Bateman, 36, Addington Square, Camberwell.

WANTED, 9 h.p. Riley or Singer tricar, in sound order, cheap for cash.—6, Bridge Street, Cambridge.

WANTED, 3½ h.p. Motor Bicycle, 1907, magneto; approval. — Marshall, East View, Lindal, Lancs.

WANTED, Push Cycle and cash for 2¾ h.p. Minerva, like new.—9,670, *The Motor Cycle* Offices, Coventry

WE Purchase Motor Cycles for cash; exchanges entertained. — Motors, 26, Offerton Lane, Stockport.

WHITTLE'S Belt, 9ft. by ⅞in., good condition; approval, deposit.—Woolston, Snarestone, Atherstone.

WANTED, a radiator, 1ft. 9in. long, and 1ft. high, gilled or honeycombed.—Moreton, Bembridge.

WANTED, for Easter, Motor Cycle, also tricar or car; must be cheap. —W. Gait, 7, Dagmar Road, S.E.

WANTED, Twin Rex de Luxe, in good condition; cash waiting.—Hill, Rectory Road, Sutton Coldfield.

WANTED, good leather D.B. coat, length 34, chest 44 inches or more —S., 2, Ermine Street, Huntingdon.

WANTED, modern motor cycles, must be cheap for spot cash.—Smith, Ford Street, St. Mary, Nottingham.

WANTED, 1907 or 1906 Triumph, any condition; must be cheap for cash.—Rey, 5, Heath Street, Hampstead.

WANTED, twin Peugeot engine, also 850 by 120 inner tube and non-skid. —Ferris, 41, Church Street, Camberwell

WANTED, comfortable coach-built seat, for forecar attachment, with low springs.—O.S., 369, Edgware Road, W.

WANTED, motor cycle; exchange upright grand piano.—No. L2,074, *The Motor Cycle* Offices, 20, Tudor Street, E.C.

WANTED, Cane Sidecar and little cash, 26in. wheel, exchange 1½ h.p. Minerva, B103.—Waddon, New Road, Croydon.

WANTED, 3 h.p. Fafnir engine, complete, fair price; no crocks; approval.—Dew, Lullingstone, Eynsford, Kent.

SIDECAR, for 28in. wheel bike, Montgomery preferred; cheap for cash. —Francis, 8, Guildford Road, Southend-on-Sea

WANTED, 1908 Triumph Motor Bike and £10 in exchange for two-cylinder two-seater car.—Stagg, Thorpe Vicarage, Chertsey.

WANTED, 2½ h.p. De Dion water-cooled head, for Royal Enfield trike, sound and cheap.—Wright, 47, Sunny Bank, Sheffield.

WANTED, in good running order, Motor Cycle; payments 20s. a month. —P.B., c/o Stanley's Library, 56, Stanford Hill, London, N.

WANTED, good motor cycle or tricar, in exchange for new furniture, any description, direct from works, valued wholesale.—Elias Steinberg, 9, French Place, Shoreditch, London.

WANTED, drilling machine, for power, and cash to the value of £16, in exchange for 3½ h.p. motor cycle, low built, extended handles, low seat, brass tank, grand hill-climber.—P., 19, Myddleton Square, Clerkenwell.

The "CELERIO."

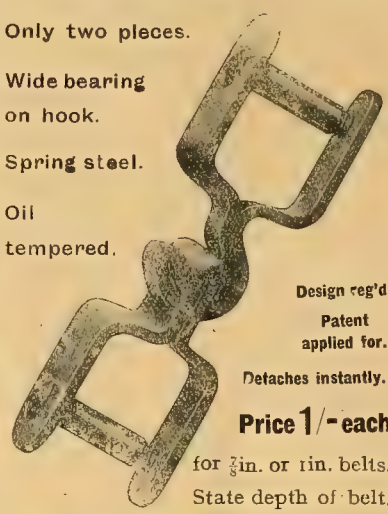
A PERFECT BELT HOOK.

Only two pieces.

Wide bearing on hook.

Spring steel.

Oil tempered.



Design reg'd.

Patent applied for.

Detaches instantly.

Price 1/- each

for ⅞in. or 1in. belts.

State depth of belt.

The RICH Detachable Air Tube Co.,

CRAWLEY. SUSSEX.

WANTED.

MOTOR Cycle, in exchange for gent's three-speed cycle, ½-plate camera and apparatus, all as new.—H.S., 414, Alfreton Road, Nottingham.

WANTED, 26 by 2 studded cover, wired-on, small spray carburetter; approval.—Estop, 8, Hertford Road, Downham Road, Kingsland, N.E.

WANTED, Sidecar, suit 3½ h.p. Rex, right side, any condition, if sound, or without tyre, or exchange trailer and cash.—28, Hurst Grove, Bedford.

WANTED, 5-6 h.p. Twin Forecarriage, two-speed gear, free engine clutch, must be in good condition, will give new piano; cost £26 5s., with ten years' warranty.—Box 9,664, *The Motor Cycle* Offices, Coventry.

CYCLE Agents should read "The Cycle and Motor Trades' Review," the leading trade organ; specimen copy will be sent on receipt of trade card. — Address, "The Cycle and Motor Trades' Review" Offices, Coventry.

WANTED.

£25 offered for 3 h.p. 1907 Triumph, in good condition; immediate purchase.—9,613, *The Motor Cycle* Offices, Coventry.

WANTED, good motor bicycle; would exchange large well balanced canvas canoe.—S. H. Fitch, Elmhurst, Romford.

WANTED, twin or single motor cycle, magneto Triumph preferred; state where seen; London suitable.—4, Lodge Lane, Liverpool.

WANTED, 4 h.p. Stevens engine, 4½ h.p. Jap, 6 h.p. Jap, or 4½ h.p. Noble, perfect, but cheap.—14, Marina, Esplanade, Southampton.

WANTED, motor cycle, not less 5 h.p., magneto, Rex de Luxe or Vindec, or good make; £25 to £30.—Cullum, 27, Butts Hill, Frome, Somerset.

TRICAR, Riley preferred, will give £40 for genuine bargain; expert examination and trial.—9,675, *The Motor Cycle* Offices, 20, Tudor Street, E.C.

TRICAR, three-seated, coach-built, open frame; cheap for immediate cash, or exchange handsome pony turnout. — Knight, Maypole House, Bexley, Kent.

WANTED, a real good tricar or small car, must be perfect, will exchange goods to the value of £50, mostly antique; all letters replied to.—41, Warwick Road, Batley.

TRICAR or motor cycle as part exchange for 7 h.p. Peugeot car, detachable tonneau, splendid condition; photo.—B., 38, Lonsdale Road, Barnes, S.W.

RILEY, Singer, or similar tricar, twin-cylinder, 6 h.p., three speeds and reverse, wanted; cheap for cash.—Batchelor, Clarence Street, Kingston-on-Thames.

ADVERTISER will give up to £40 for really reliable two-seated tricar, something similar Rex Litette preferred; trial required before purchase.—Address, Pembury, Staveley Road, Eastbourne.

WANTED, good second-hand motor cycle, not less than 3½ h.p., with or without free engine and two-speed gear; cheap for cash.—Full particulars, No. 9,652, *The Motor Cycle* Offices, Coventry.

MISCELLANEOUS.

THE Best Silencer made is Aldington's patent Silent, from 10s. 6d.—Below.

THE Ball Bearing Ideal Fan will cool any engine; 28s. 6d.—Below.

MY Footrests, reduced to 6s. 6d., are a luxury, spring rests, 17s. 6d.—Aldington, 59, Haydon's Park Road, Wimbledon.

BEST Offer accepted for first two items Too Late Column, March 25th.

TANKS of all kinds made to order.—Doggett, metal worker, 65, Turnmill Street, London.

TWIN Bassee-Michel trembler coil, as new; bargain, £15s.—135, Antill Road, Bow.

MOTOR Tricycle Frame, complete, new; will sell cheap.—Cox, 94, Long Street, Birmingham.

60 Amp. Dynamo, £1 10s.; trembler coil, 8s. 6d.—113, Plashet Grove, East Ham, Essex.

WHIPCORD Breeches, latest cut; 10s. 6d. — J. C. Savage, 119, Donegall Street, Belfast.

FIRST £1 has splendid collection 750 stamps, valued double. — Brown, Jun., Leuchars.

2½ h.p. M.M.C. engine, new, never used; £5 10s.—Woodhouse, Main Street, Sedbergh, Yorks.

5-7 h.p. Twin Peugeot, engine only, perfect; cheap; offers.—123, Graham Road, Hackney.

4½ h.p. Jap Engine, £7 15s., brand new; sidecar, £3 15s.—Granville, 209a, Peckham Rye, S.E.

TWIN Non-trembler Coils, new, unused, best make; 12s. 6d. each.—Farrar, Square Road, Halifax.

American Amateur Definition.

OUR readers will remember that the President of the Federation of American Motor Cyclists recently stated in the *Bicycling World*, New York, that any American riders who came over and competed in the Auto Cycle Union End-to-end Trial would be prevented from competing in any further amateur events in America. He based his threat on the fact that competitors in the A.C.U. events competed for cash or medals, at their option. In the End-to-end Trial there is a Private Owners' Class, which, in our opinion, completely covers the ground as far as amateur riders are concerned. However, the President of the F.A.M. has written to the Secretary of the A.C.U. (in reply to a letter addressed to him) giving the American definition of an amateur motor cyclist, and confirming the threat against American riders. This definition should be interesting to our readers, and we therefore publish it below. We trust the American competitors will still come over and compete in the End-to-end event, even if they have to lose their American amateur status. We already understand that one of the intending American competitors will come over and follow the riders throughout the trial, even if he does not actually compete.

[Extract from letter sent to Mr. F. Straight, secretary A.C.U., by Mr. R. G. Betts, president F.A.M.]

THE F.A.M. DEFINITION OF AN AMATEUR.

"An amateur shall be construed to be a man who has not competed in any sport against a professional or for cash, whether in the form of prizes, wagers, gate receipts, or 'appearance money'; who has not sold or otherwise realised pecuniary benefit from a prize, and who does not engage in competition as a means, or a partial means, of livelihood.'

Through Routes.

IN a paragraph elsewhere we call attention to the fact that the R.A.C. is pushing forward the work of signposting Watling Street. The secretary in a recent report rightly calls attention to this old, and in places diverted, highway as an excellent means of communicating with many large towns, also as a through route from London to the Welsh border, avoiding Birmingham and the Black Country. This good work on the part of the R.A.C. calls to mind the fact that the Watling Street has been diverted in several places, or, to be correct, the existing main road no longer follows the old line of route, but leaves it at various points to rejoin it further on. For example, the old line of Watling Street runs direct from Weedon on the London-Holyhead Road to a point about two miles beyond Kilsby station on the London and North-Western line, whereas the existing main road goes round through Daventry, and those who wish to pick up the Watling Street again must travel *viâ* Daventry and Kilsby. The old line of route is easily traceable from Weedon to where it rejoins beyond Kilsby, and there are, of course, numerous other instances of its diversion. The purport of these few lines is to point out the immense advantage it would be to motorists generally if the unused stretches of this road could be remade. The old line is there, and the foundation exists, so that it would be a matter of comparative ease to relay it with a surface dressing and clear away the brushwood, and a through route would thus be provided from London to Shrewsbury, and so on to Holyhead. Points we know in addition to the one mentioned above at which diversions have been made are near to Shenstone, Lichfield, Wellington, St. Albans, and doubtless there are others.

Lightweights for Ladies.

IN the recent discussion on the future of motor cycling, it was gratifying to find so great an authority as Dr. Hele Shaw use these words, "And ladies, too, ought to be catered for." Of course, they ought. I have been preaching this gospel in *The Motor Cycle* for years, and long ago expressed the opinion that it was not so much mechanical difficulties which prevented my sex from adopting the delightful and exhilarating pastime with enthusiasm as the terrible weight of the machines they were called upon to ride.

I have now owned six different motor bicycles. Beginning with a 1¼ h.p. Minerva built by poor Dan Albone, I successively tried a 2 h.p. of the same make, a Clyde, a Phœnix, a 2¾ h.p. Hulbert-Bramley, a 3 h.p. Singer, and a 3 h.p. Advance.

Mrs. J. T. Robinson, of Huddersfield, who hopes to tour with her husband this year on a motor cycle. Mr. Robinson is a well-known local cyclist and motor cyclist. Mrs. Robinson has purchased Miss Muriel Hind's 3 h.p. chain-driven Singer.

Looking back on my varied experiences, I can confidently affirm that the machine I liked the best and did the longest journeys on was that of the lowest horse-power. Apart from vibration (it was before the days of spring forks), the terminals frequently shaking loose, and slip of the round belt, my troubles were *nil*.

Worries Increase with Weight.

But they augmented with increase of h.p. Timing pins sheared off; magneto bedplates lost their bolts, letting the chain fly from the cog wheels; exhaust valves jammed in their guide; and sundry other mishaps occurred from time to time. I am sure that the ordinary good lady cyclist would not object to assisting a small engine; mind you, I say assist, not pedal. There is a mighty difference. The former is quite a pleasurable sensation; the latter a deadly, heart-straining labour. Speed has great charms, I admit, but independence possesses greater. An average woman weighing about 9 stones has not the physical strength to start a machine of nearly 200 lbs., save down a slope. This is a tremendous drawback. Often whilst pushing and hauling my bicycle to a favourable incline, I realised how the tortoise could beat the hare, and how a lightweight permitting of easy mounting was really more suitable for a woman than a speed monster. Personally, I am not ashamed to admit that after experimenting in many directions I am now going back to a low horse-power combined with a light bicycle, which I can push, pedal, and manipulate at will without any undue effort.

The Clyde Co., Leicester, have built for me a machine with a Motosacoche set, the weight of which does not exceed 80 lbs. I hope shortly to submit a photograph for inspection, and if it does not induce many ladies to enter the ranks of motor cyclists I shall be greatly disappointed. In my humble opinion it more nearly fulfils the requirements of the female sex than any machine I have yet ridden. Lightness, strength, and rigidity are combined with handle-bar control (which I have ever advocated), a two-speed gear hub, most efficient brakes, and high-tension Bosch magneto, Type DA1.

A Real Motor Bicycle.

The whole constitutes a real motor bicycle, not a mere toy, as some might imagine. But it is a machine that even frail woman can pedal home with ease and comfort in the event of any breakdown arising beyond feminine skill to repair. In place of sallying forth with a vague amount of uncertainty as to her return, she can undertake a journey full of confidence, knowing that if the worst comes to the worst she has only to unhook the belt, when her mount becomes almost as easy to propel as an ordinary bicycle. Surely the time has come when even timid ladies may go in for a lightweight. Personally, directly I saw the Motosacoche and what it could do, my mind was made up.

MRS. EDWARD KENNARD.

[WITH APOLOGIES TO W. S. GILBERT.]

By the side of a motor an architect stood,
Singing willow, tit-willow, tit-willow.
Said he, the design of this bike is no good,
Singing willow, tit-willow, tit-willow.
So I'll change all the wiring—a new coil I've got—
Plugs, tank, carburetter, and heaven knows what,
And I've handle control for the whole bally lot.
Oh, willow, tit-willow, tit-willow.

For weeks upon weeks, and from morning till night,
Oh willow, tit-willow, tit-willow,
He worked at that motor with main and with might.
Oh willow, tit-willow, tit-willow.
The bike then was certainly like a new pin,
And at Brooklands he thought it could easily win;
But, alas! when the bills for the new parts came in ——.
Oh willow, tit-willow, tit-willow.

MORTON BROWN.

Flash antiseptic cleanser is, as its name indicates, a preparation for removing grease, dirt, etc., from the hands. We have tried it, and it certainly does its work well. It can be obtained from Brown Bros. Ltd., Great Eastern Street, E.C.

Recently "Ixion" stated that the manufacture of Autoclipse lamps had been discontinued. This statement is incorrect, as Brown Bros. write that they have taken over the agency for the Autoclipse lamp, and intend to push it. The 1908 model embodies the following improvements: (1) Double back, with stronger lamp bracket on the back; (2) flat face, instead of round spun-over face. The weight is 2½ lbs., and the lamp can be supplied with three different types of brackets.

DUAL IGNITION

A CONSIDERABLE amount of doubt exists on the subject of dual ignition, *i.e.*, with regard to ignition by battery or magneto at will, particularly in the case of the Eisemann magneto, using ne contact maker, and that the one on the magneto iachine, to produce the rupture of the current. A orrespondent recently pointed out iat he had obtained erfect results with n Eisemann mageto fitted to a ½ h.p. N.S.U. y adopting a sysem of wiring as in g. 1. This system s to enable a rider f a machine so tted to use an ccumulator or iagneto at will by ieans of a two-way vitch. We have eard so many ifferent opinions ith regard to this system of wiring with an accumulator in the circuit, and the Eisemann magneto, and ie damage it is likely to do to both accumulator and agneto, that we submitted our correspondent's letter with regard to the Eisemann magneto to the United Motor Industries, Ltd., 45 and 46, Poland Street, W., who replied as follows:

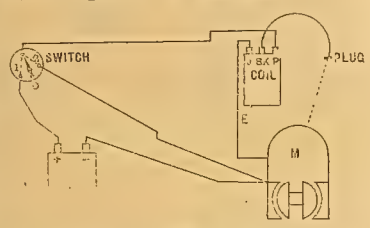

FIG. 1.

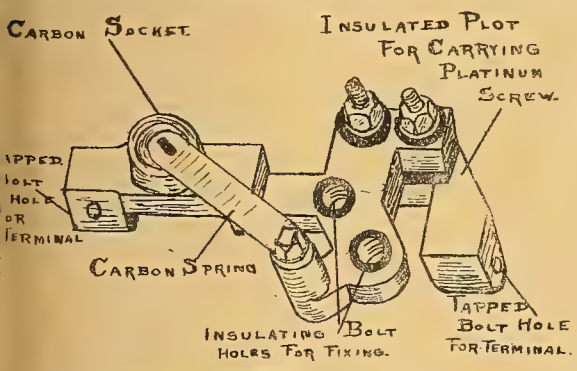
To use an accumulator or magneto at will by means of a two-way switch.
Switch on 1 Starting position. Accumulator in circuit.
,, ,, 2 Magneto in circuit.
,, ,, 0 Neutral (off position).
The letters on coil correspond with those on N S U coil.
The low tension wire from terminal J on coil is earthed to frame.
The wires from magneto to switch and accumulator start from same terminal on magneto. An ordinary two-way switch is used.



CARBON SOCKET
INSULATED PLOT FOR CARRYING PLATINUM SCREW.
TAPPED BOLT HOLE FOR TERMINAL
CARBON SPRING
INSULATING BOLT HOLES FOR FIXING.
TAPPED BOLT HOLE FOR TERMINAL.

FIG. 2.

Sketch showing the insulated plot as fitted to the contact breaker of Model C Eisemann magneto machine.

"It is perfectly correct that, as per sketch, your correspondent could get results with the accumulator in conjunction with the coil, but if he does not take out the carbon which connects the magneto current through the bus bar, the accumulator is likely to be short circuited if the switch is accidentally turned on afterwards, and, not only this, but he would be charging the accumulator up with an alternating current from the magneto while the switch is on the accumulator side. We take it this would only be a temporary matter, because we presume he would switch over immediately the machine had started.

"The suggestion, as per the diagram, fig. 1, is really not a proper system to use. We may mention that such a scheme was tried by Panhard and Levassor a few years ago, and, curiously enough, one of the troubles was hard starting, which is one of the difficulties your correspondent desires to overcome. If the carbon be taken out, results can be obtained, but it is not advisable that the carbon be continually handled, as such a procedure is liable to weaken the spring which clips the carbon in, and this would result in faulty ignition on the magneto. We should only recommend the system of wiring as shown, under such circumstances as to get a man home if the magneto were broken down.

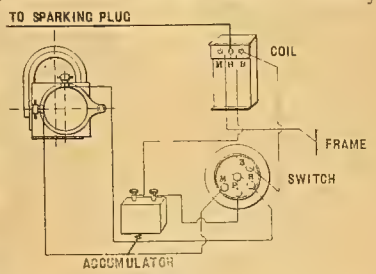


FIG. 3.

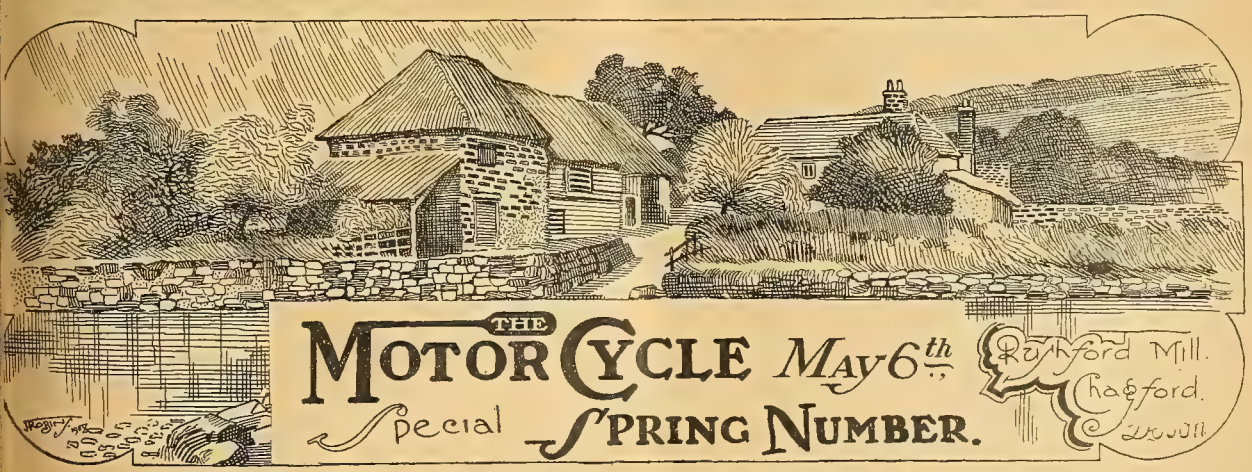
Wiring diagram for Eisemann Model C magneto when used with accumulator or magneto at will, and insulated plot. The switch letters signify
R. Both ignitions "off."
M. Magneto "on."
P. Accumulator "on."
B. Terminal for wire to coil.

"Now, the system which we should advise would be what is known as the dual plot system, as now used by Panhard and Levassor (see figs. 2 and 3). The insulated plot for model C magneto, including the switch, is one guinea, and this part can be obtained from our address as above, or from the Coventry depot, Sherbourne Works, Gosford Street, Coventry."



MOTOR CYCLE TOURING.*

(Continued from page 300.)

THE DISCUSSION.

The Chairman, Mr. Chatterton, commenced the discussion by congratulating Mr. Candler on his lecture, and his success in speaking without notes. The success of a tour mainly depended on temperament. He had toured with Mr. Candler, and had had a good many breakdowns, but they were pleasant to look back upon. Mr. Candler had alluded to motor cycle touring, but he thought all forms of touring are enjoyable, walking, push bicycle, or touring about in taking train from centre to centre. With regard to doctors' ideas that motor cycling was beneficial for the lungs, he was sure medical opinion was borne out by experience. Nothing so revivified the constitution as riding a motor cycle in beautiful air; and as to cycle camping and the beautiful and interesting slides Mr. Candler had shown of it, he hoped Mr. Candler's lecture would induce some of the audience to adopt this admirable and healthy form of touring, and trusted this question would be heartily discussed. He proposed a vote of thanks to the lecturer, which was accorded with acclamation.

Professor Archibald Sharp continued the discussion. He had not done a tenth part of the touring he should have liked, though he had had the privilege of touring a little in Mr. Candler's company, and he thought the delightful word picture given was more than borne out in practice, especially if his advice to choose a suitable companion is followed, and if Mr. Candler is available don't miss the opportunity of getting him. Motor cycling on the Continent had been neglected by English motorists, and he called attention to the announcement in the R.A.C. *Journal* that he and Mr. Chatterton had made arrangements to start classes in Esperanto. It was suggested that a party of motor cyclists should be organised to make a journey to Dresden in August and attend the Congress of Esperantists. Though Esperanto was ridiculously easy, he did not say you could tour abroad and talk to everyone you met, but it was possible between now and August to get a conversational knowledge of it, and if motor cyclists of France and Belgium could be persuaded to do the same a new vista would be opened up. He specially expressed his personal pleasure in listening to Mr. Candler's lecture. (Hear, hear.)

Mr. H. G. Bell endorsed Professor Sharp's remarks. He had no idea Mr. Candler had been so great a traveller, and regretted he had not been with him on his journeys. He gave some experiences of losing friends while touring, and agreed with the counsel of Mr. Candler to arrange a meeting place. Referring to trouble in getting petrol, at Cork he emptied out water instead of petrol when challenged by the authority, knowing full well there was none at Milford Haven. He thought home scenery and roads should receive first attentions. He welcomed the fact that Humber, Ltd., were going in for motor bicycle manufacture. He hoped the firm would bring out a good touring machine of moderate power and at a moderate price.

Mr. Reynolds had enjoyed the touring yarns; in describing experiences they had seemed to be describing his own. He had done much touring on push bicycles, and no doubt it would be very interesting to do it over again on a motor bicycle. Mr. Candler had been very hard on the heavy bicycle on account of starting. He thought it was a matter of personal attention to the machine, keeping it clean, and in good order, which obviated any difficulty in starting. In hilly districts an efficient two-speed gear was a necessity. A suitable companion was also necessary, and although attended with great risk, advertising had secured him one of the best of touring companions. With regard to arrangements for meeting, he had lost a friend for three days through neglecting proper precautions, and his friend's pocket was, to make things worse, in an unfilled condition, what little cash there was in it being devoted to telegraphing home for more.

Mr. Moeller (Secretary Association of Cycle Campers) then exhibited a touring camp outfit, one weighing 15 to 16 lbs., for two persons. He recommended especially aluminium saucepans—with detachable handles—unjointed knives and forks, and paraffin stove. Enamel cups were better than those of aluminium, as the latter soon became hot, and remained so a long time, even after the liquid contained in them had cooled. A full set of camping apparatus was exhibit and explained by Mr. Moeller. He claimed that campi was not a fad. In spite of the weather his association h year doubled its membership, and they had recently receiv many press notices. When camping they did not live pemmican, their dinners were of three and four cours Practically every farm is a camping site, for permission camp is easily obtained. A little shelter is all that is need and this gives rise to an added interest in the way the wi is blowing or is likely to blow. A tent has been erected a prepared in two and three-quarter minutes, and with a lit practice anyone could do the work in five minutes. A gr charm of cycle camping is to be able to start at an early h in the morning. Several of the members of the associat go to the Continent for camping tours every year, and speaker himself some years ago went a tour in Belgium, this country, he thought, was not a suitable one, except Ardennes. Mr. Moeller answered numerous questions *re* camping kit, the cost of which latter, for two, would be ab 70s. to 80s.

Mr. Tuchman thought Mr. Candler's paper the best si Mr. O'Gorman addressed them. He claimed a little exp ence in motor cycle touring in France, Belgium, Holla and Germany. Though some amongst them might th Mr. Candler rode an old-fashioned machine, this was not It was on Mr. Candler's advice that he went in for a 3 h Quadrant, and it had given excellent service. He agr that a single cylinder motor bicycle was best, and a g strong-framed one. One of the greatest boons was a m neto. There may be an impression that when you are the Continent you are in for trouble, but the Continer repairer is a friend. The speaker's tank went wrong when French tour, and the repairer for three hours' work char only four francs. Accumulator charging stations may seen in the excellent "Guide Michelin," issued by Michelin Tyre Co. at 3s. In touring he objected to packing up in the morning, and the lack of carrying sp was a drawback to motor cycle touring. For himself, dispensed with as much as possible. He strongly rec mended the Continent of Europe for touring on account good roads, and there was nothing to be afraid of; there every reason to go out of this country.

Mr. Hooydonk thought camping was sometimes taken a bit of a freak, peculiar to vegetarians, non-smokers, He had last summer gone on a tour and found it most joyable and very comfortable. There was no need to on the score of weather.

Mr. Candler wound up the discussion and thanked audience for their appreciation. Answering a question Customs formalities, if one is a member of the Cycli Touring Club or Touring Club de France, these matters sent no difficulty in France, Belgium, and Switzerland. is more difficult in Germany, and it is not a simple ma in Italy. The great charm of touring was to make a tinual picnic. Choose a quiet place by a stream, where could have a cup of tea in a far more enjoyable manner t in an hotel, where the cost would be five times more, less comfort. If what he had said, concluded Mr. Cand induces *one* even to go in for motor cycle touring, he sh feel his labour had not been in vain.

Mr. C. Owen, who has been for some time identified w the Premier Motor Co., Ltd., wishes to announce that h resigning his position as a director of that company.

We are asked to state that Mr. W. Hayes, who recei resigned his position with Messrs. J. Horner and Co., again take an active interest in the control of the Rex age at 21a, Store Street, W.

The Quadrant Motor Co., Ltd., Earlsdon, Coventry, wo be glad if all readers, when addressing communicati to them, be careful to use the full title of the company above, and so avoid confusion with any other firm.

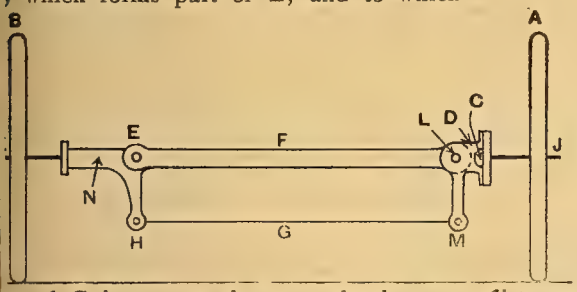
J. H. Calvert and Co., Eston, Yorks, wish us to inf readers that they are not manufacturing the two-speed g described and illustrated under the heading of "Rec Patents," April 1st.

* A lecture by Mr. A. Candler delivered before the members of the Auto Cycle Union on Friday, April 10th.

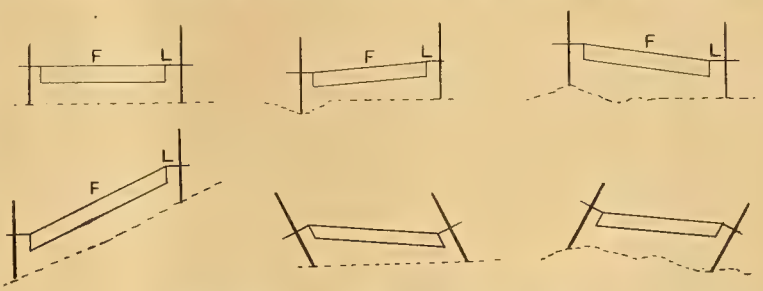
A Novel Sidecar Suggestion.

WE have received particulars of a novel suggestion for a flexible sidecar. Without making an experimental machine for trial it is, of course, impossible to say how the device would act n the road, but it appears to have possibilities.

The line drawings, which are reproductions from ır correspondent's sketches, show the back kle only of a sidecar, and it will be seen ıat the axle F of the sidecar is free to move ertically on the bearing L. It is also ointed at E, and practically corresponds to e jointed or Ackermann type of fr wheel kle of a tricar. A represents the back heel of a motor bicycle, C the chain stay, a bracket secured to C, and having a earing at L, and another M vertically ıderneath. N is another bracket free to ove on the joint E, and having a lever , which forms part of E, and to which



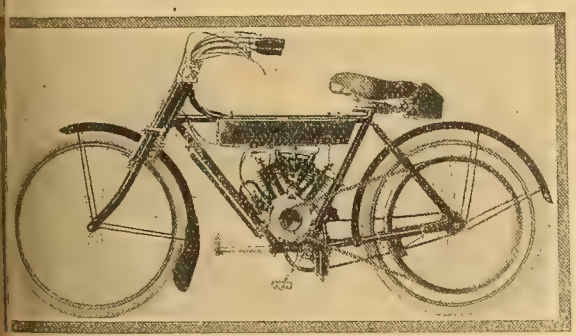
rod G is connected at exactly the same distance art as the centres of the bearings E and L. K represents the axle of the sidecar wheel and B the sidecar wheel itself. It will be apparent that the wheels of the sidecar and bicycle must always be parallel, because any movement of the bicycle out of the perpendicular line moves the lever M. The movement is then conveyed by the rod G to H, and the



sidecar wheel assumes the same angle as the bicycle. Any sideslip would involve the dragging or pushing of the sidecar wheel sideways, and the resistance of the sidecar wheel, it is claimed, will prevent sideslip. The other line diagram shows various positions that the wheels would assume on unequal ground, the wheels of the bicycle and sidecar remaining parallel to one another. It is suggested that by temporarily attaching either F or G to either N or D by a rod or stay that the bicycle and sidecar would then stand upright without any support. The front of the sidecar frame would be suitably connected to the bicycle by a flexible joint, the movement allowed by the joint being vertical only.

IMPROVEMENTS IN THE MOTO-REVE.

INCE we chronicled our experiences with the Moto-Rêve twin cylinder lightweight machine, we have heard from the company that some improvements l be introduced on future machines sent out. The ıdles will henceforth be turned down slightly to pro-le for a still more comfortable position. Footrests can



The 1908 model 2 h.p. Moto-Reve with direct belt drive.

supplied, when ordered, these being made of steel ing and plated. They fit into the end of the tube ich projects from underneath the crank chamber. e attachment for the belt rim is now being made more id, and orders for machines received after the pre-t date will have belt rims specially made, and ked to the wheel. These belt rims will be provided h 5⁄8in. V grooves of 28° angle, which will allow of a direct drive, the frame being altered slightly to allow for the necessary clearance for the belt. The stand and carrier have been considerably improved, and made separate. The stand will be fixed to the chain stays to allow for removal of the back wheel with the machine jacked up. The carrier will be of the tubular pattern, and the firm are prepared to supply these carriers for all makes of motor cycles. The saddle is also to be made more comfortable. To provide for easy starting, a tank is being fitted for paraffin. This will be a continuation of the petrol tank in front, and will be fitted with screw down valves and pipes leading to the two compression taps. It will hold about a quarter of a gallon, and it will be possible to inject a small dose of paraffin every time before starting without soiling the fingers or tool-bag. The Motor Rêve Co. tell us that an instruction booklet is in the press with an illustrated and numbered list of spare parts for the machine.

The second edition of "The Autocar Handbook," Iliffe & Sons Ltd., 20, Tudor Street, E.C., is now on sale. The whole edition has been entirely revised, and many illustrations have been added. "The Autocar Handbook" is naturally of greater interest to automobilists than to motor cyclists; nevertheless, as a certain number of motor cyclists are always in the transition stage between motor cycling and automobilism, the handbook will no doubt be eagerly purchased by many of our readers. The price of the book is 1s. 6d. net or post free for 1s. 9d.

Occasional Comments

By "IXION."

The End-to-end Record.

Little whispers in motor cycle circles indicate that quite a crop of attempts will be made this year on Harold Williamson's figures for a record ride between Land's End and John-o'-Groat's. The last two years have been practically stagnant as regards this once jealously desired record, and the recrudescence of plans upon it proves two things—that machines are greatly improved, and that the trade in machines is exceptionally flourishing. Competition for this record died down both because the figures set up by Williamson were too good to afford any very great promise of a new record with the machines then in vogue, and also because things were a little slack in the industry, and makers did not care to face the expense of an attempt, coupled to very probable failure. I shall be surprised if Williamson does not have to choose this year between surrendering the Rex record or setting up new figures on one of his later machines.

Sidecars in the End-to-end.

Several enthusiasts have written me *apropos* of entering sidecars in the End-to-end, and to save myself further letters, as I am too busy at present to deal with individual correspondents, I will state the main reminders I have to give on this special point. The first is the need of ample power. While Berriedale is the only really exacting *gradient* on the course, there are some very trying hills, and head winds are to be expected up North. A sidecar suffers much more from windage than a tricar, and with an air-cooled engine the long ascents of Shap and the Grampians will demand a very high h.p. indeed if the conditions chance to be adverse. Each ascent includes miles and miles of climbing, and should the wind be adverse and the roads heavy, only powerful cycles will manage the ascents, while they are too lengthy for pushing to be consistent with the retaining of a clean score sheet. My second reminder is the need of a really low second gear. I think 9 to 1, with a combination weighing 260 lbs. unloaded, will not be a point too low for the work to be tackled. My third is the provision of a very staunch rear cover. There are some bad surfaces and plenty of sharp corners. Most of the rear tyres fitted to twin-cylinder motor cycles have no margin of strength for the work they are designed to perform, and when a second passenger, a lot of luggage and a sidecar are added, a much larger tyre and rim are emphatically called for. Personally, I should not dream of entering a sidecar except with a voiturette tyre on the driving wheel. It is to be hoped that any sidecar entrants will study their outfit carefully. The sidecar is now booming very nicely, and we do not wish to see its popularity daunted by the entering of several unsuitable outfits, doomed from the start to certain failure. The easy conditions and uniformly pleasar weather of 1906 are scarcely likely to be repeated.

A Weird Experience.

Seeing that certain correspondents had been sendin me strange yarns of late, the works manager of a ce tain motor cycling firm has retailed the following which he vouches for (personally, I feel bound to mai tain strict neutrality). He sold a twin-cylinder machi to a customer who was a bit of a duffer. The said cu tomer returned the machine a few months after, allegi that it would no longer climb hills as it used to. T mechanics speedily found that the inlet valve w altogether missing from one cylinder, and present they noticed a gaping rent in the top of the pisto which proved that the valve had gone through it a down into the crank case. On dismantling the cra case they found an absolutely spherical metal marb This proved—so he says—to be composed of t moulded remnants of the inlet valve, which h dropped into the engine owing to its cotter comi adrift. It had worked in between the flywheel and cheek of the crank case, and had scored a deep groc in the aluminium all the way round. Next please!

Kit of Spanners.

This week I have received the catalogues of t American motor cycle manufacturers, and I notice th in each case they supply a kit of spanners identi with those used by their own fitters in the works assembling the machines. This is a very excell idea. The gratis tool kits of English makers rapidly improving, but I have never yet received wit new machine a kit of tools available for every nut the machine. There is always at least one nut which a special tool has to be made at the first opp tunity. Sometimes it is the petrol union beneath carburetter, sometimes the nut at the bottom of internal oil pump, sometimes one of the nuts on base flange of the cylinder; but, whichever it is, th is always one nut at the very least for which I mak special spanner after attempts to shift it with those the free kit. Even if a small extra fee were charg for the kit, riders who habitually attend to their o mounts would be glad to own as convenient an ou as possible. The addition of three small t spanners with a tommy bar, or two or three op ended S spanners would be all that is needed.

Messrs. Markt and Co., 6, City Road, E.C., inf us that their little Baby Auto-torch, an accessory which we have previously referred, is selling so rema ably well that they have been enabled to reduce price to a very low figure. Motor cyclists will f this handy little blow lamp of inestimable use small repairs in the garage. It burns ordinary pe and will last for two hours on one filling. It will burn in any position, so that all sorts of inaccess little corners may be reached by it.

BELT v. CHAIN.

A Reply to Mr. B. H. Davies, by A. WHARTON METCALFE, Assoc. M. Inst. C.E., etc.

THE article by Mr. B. H. Davies on the above subject in your issue of April 1st will doubtless command almost as great an interest generally as his many previous contributions on various ics of motor cycling interest have done.

Mr. Davies has done much to advance motor cycling, t perhaps his most important work has been in con- tion with the question of variable gears, in regard which he has educated motor cyclists, while he has ng from manufacturers a grudging recognition of importance of the subject, which has resulted in a nber of them devoting some attention to their pro- tion, so that there are now a number (good, bad, and ifferent) from which selection can be made, to say hing of variable pulleys and free engine clutches, ich are stepping stones to variable gears.

The Future of the Motor Cycle.

The consistent attitude adopted has made innumer- e converts, and I do not think it is saying too much contend that the success of the motor cycle in the re as a means of taking lengthy tours far afield is issolubly bound up with this question of variable rs. It is therefore with feelings of some regret that r reading Mr. Davies's article on the above it ned to me that in his out and out advocacy of the ky" belt drive for solo machines he was likely to rd the advance of variable gears to some extent.

Mr. Davies says that those makers who have adhered ie chain drive for the last five or six years turn out oughly satisfactory examples of it, but, as a rule, ill be seen that such makers have been compelled dhere to it, through some feature of their machine h as a two-speed gear) forbidding belt transmission gether, by which he means, presumably, that the icular type of two-speed gear precludes the use of elt.

Mr. Davies admits, frankly, that the exponents of chain-driven motor cycle make a good article. It so a matter of common knowledge that the Phelon Moore and the Anglian two-speed gears are the widely known gears with chain transmission, and are eminently satisfactory. The Anglian can used in conjunction with a belt, and I believe the lon and Moore could be altered to do so, though btless it would lose in efficiency.

ssuming, however, for the moment that the belt is uded and that we confine ourselves to solo machines, ould restate the chain *v.* belt controversy thus: ain-driven two-speed gear motor bicycle, in spite ertain disadvantages attaching to the chain, is pre- ble in any case to a single gear belt-driven motor cle, and, until two-speed belt-driven gears are much oved, even to a two-speeder. Free engine clutches variable pulleys, being in the nature of makeshifts, rposely leave out of the discussion.

The Pros and Cons Considered.

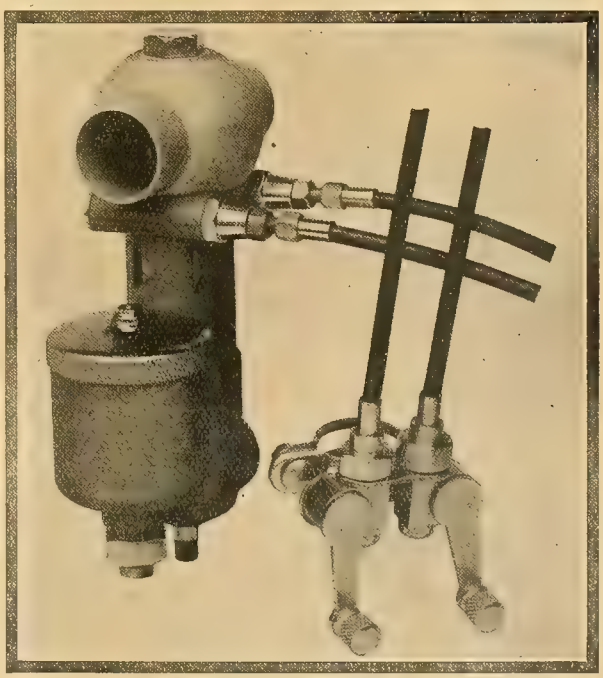
he objections to the chain drive are (1) Extra ation and harshness; (2) an added risk of danger e engine jams or the chain breaks (this risk may between wide limits, and reduce to a very small ; (3) a little extra weight. Its advantages are: uitability for two-speed gears; (2) great efficiency the belt as a transmitter; (3) economy in cost and nce of transmission troubles.

Dealing with the principal disadvantage, viz., No. 1, there is more vibration, but even after a long ride of 140 miles I cannot say it has troubled me in the least. As regards harshness, it is certainly not as "silky" as the belt. On the other hand, with a good clutch it leaves little to be desired, and its discomforts have been utterly exaggerated. As to its advantages, its suitability for a two-speed gear, its efficiency as a transmitter, and its reliability place the chain far ahead of the belt for touring and winter riding.

Belt-driven Two-speed Gears.

Two-speed gears to be used with belts are of two kinds—engine-shaft gears and back hub gears. The former throw an undue strain on the belt when low gear is in use; the latter are of the epicyclic order, and if made small give trouble. Even when large they are by no means "fool-proof" (which the chain-driven gears are), and are still on their trial. I tried a 3½ h.p. belt-driven motor cycle last year, but alternately with a 3½ h.p. chain-driven—the former a 1907 magneto Triumph (single gear), the latter a 1907 magneto Phelon and Moore. The superiority of a two-speeder over a single gear for general utility converted me to two speeds and chain drive, and I sold the Triumph, which I have replaced with a second 1908 pattern magneto Phelon and Moore.

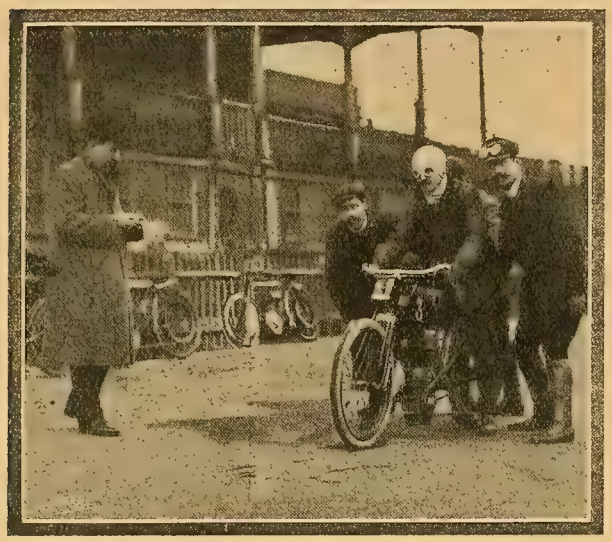
I began with gear-driven (Singer) promoted to chain-driven (Singer), from that I went to belt-driven (Triumph) for three years, and have resorted to chain-driven Phelon and Moore on account of the combination with two-speed gear, which, whatever may be the disadvantages of the chain, is, in my opinion, a combination to be preferred to a single gear with belt drive even for solo machines for hilly country and touring.



The Amac spray carburetter which was described in detail in our issue of Oct. 2nd, p. 777. The neat arrangement of the handle-bar levers, since devised in conjunction with the Bowden wire control, is clearly shown in the illustration.

Record Breaking at Canning Town.

ON Monday, the 13th inst., on the Canning Town Track Harry Martin, well known to old readers of *The Motor Cycle* as a consistent performer on motor cycles of various makes, but principally some few years back as the holder of several records and the winner of important races on the Excelsior machine, decided to make an attempt on the six hours' record made as far back as November



Harry Martin being started on his successful attempt on the six hours' record.

18th, 1902, by F. W. Chase at Crystal Palace Track (228 miles 250 yards). The record was handsomely beaten, as H. Martin rode 244 miles 1,650 yards in six hours. Records began to go at 101 miles, when Martin was 1m. 3s. inside record, and continued inside up to 120 miles, when he stopped to refill the tanks, etc. He was inside record again at 170 miles by no less than 11m. 59⅕s., and continued to improve on previous bests right up to the finish, the 200 miles record being beaten by 22m. 9⅕s.

At the start the weather was bitterly cold, with a strong N.E. wind blowing. Several storms of hail fell, and the conditions were very far from ideal from a record breaking point of view. Martin rode Collier's last year's Tourist Trophy 3½ h.p. Matchless-Jap with a single cylinder (85 by 76 mm.) and Brown and Barlow carburetter. The tyres used were Continentals, and it was not found necessary to change the front tyre at all, but the back wheel was changed once, merely as a precaution, as, from all appearances, the tyre was wearing very well. The rider stopped twice only in the six hours—the first time at 120 miles to refill tanks and change tyre, the second time at 213 miles to tighten the belt and have a rub down to restore circulation, the weather being so cold that he experienced con siderable difficulty in keeping warm. Our phc graphs will show that he was specially habited to re the temperature at high speeds, but nevertheless, ow to the inclemency of the weather, he suffered consid ably from cold.

It is interesting to note that the previous best Frer record was the one held by Anzani, who rode 220 mi 529 yards in six hours against Chase's 228 mi 250 yards of the previous year and Martin's pres record of 244 miles 1,650 yards. The machine with great regularity throughout, no troubles be experienced of any description beyond the tighten of the belt and the changing of the back wheel ab mentioned. Below will be found particulars of times every ten miles except when the rider was o side record, also some of the previous best perfo ances.

Mr. A. V. Ebblewhite, official timekeeper to Auto Cycle Union, R.A.C., etc., took the times.

The 1908 edition of "Everything for the Motoris has been revised throughout and considerably enlarg It now comprises 120 pages, most of them cramn with illustrations. It would be a very strange acc sory that could not be obtained at Gamages. A c of the book referred to will be forwarded to any rea who applies to A. W. Gamage, Ltd., Publicity Depa ment, Holborn, London, E.C.

Tuning up operations prior to Martin's six hours' ride. He rode at an average speed of almost 41 miles per ho on a 3½ h.p. Matchless-Jap.

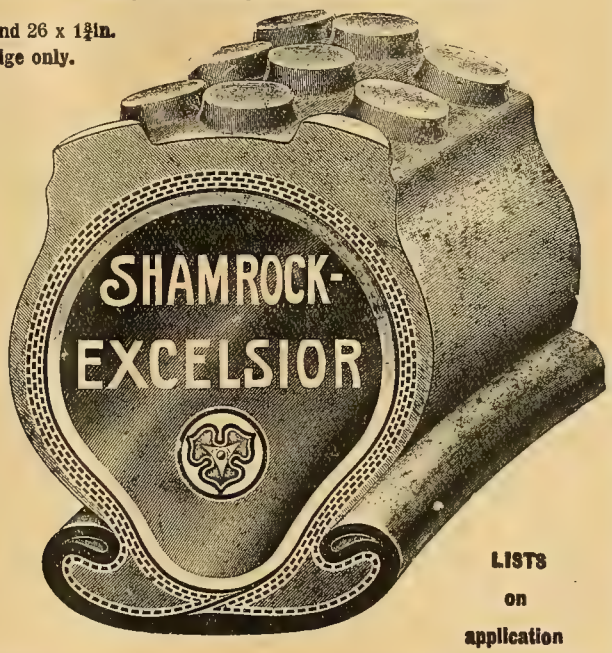
SHAMROCK
GLORIA.

THE SUCCESS OF THE YEAR.
S.E. RUBBER STUDDED TYRES.

They give complete immunity from side-slip, do not slow the machine, and are the best value ever offered. They are incomparable with any other tyre.

All sizes 24 and 26in. made, and 26 x 1¾in. lightweight. Beaded Edge only.

When ordering, please state make of old cover or give particulars of your mount. We can fit almost all existing motor cycle rims.



Having the longest experience in the manufacture of belts constant improvements have made the S.G. Belt the recognised favourite. The 1908 S.G. stands unrivalled for flexibility and long service; unlike others, each S.G. Belt is made separately. The severest control is exercised to ensure the correct position of the canvas core, thus preventing twisting of the belt or causing premature defect, so common in the cheaper class of belts. S.G.'s are in favour everywhere; see that you get one. All sizes, ½, ¾, ⅞, 1in. made.

AVOID SUBSTITUTES.

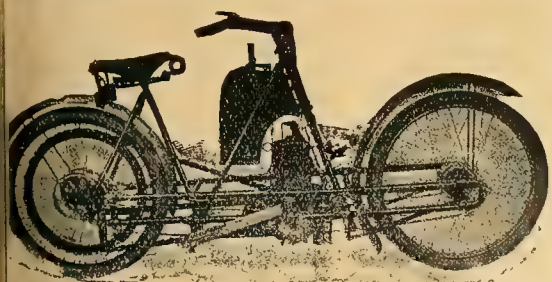
A Clever Salesman

y make you believe that black is white—whilst he speaking—but **no amount of talking** will ever make a motor bicycle h rigid frame as free from vibration as a spring frame machine, scientifically designed, *i.e.*, not one with just spring forks or ing saddle pillar.

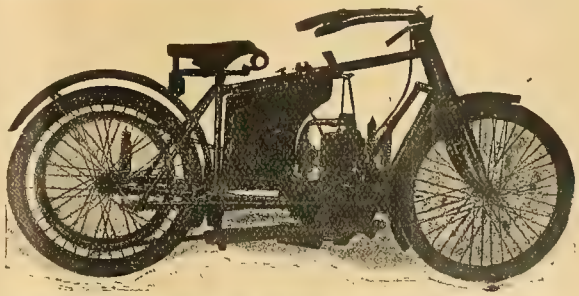
No amount of talking can render the ordinary design free from the nerve worrying risk of side-slip directly the ds get at all greasy.

No amount of talking will convince a practical engineer that the ordinary diamond-frame pattern, admittedly perfect push cycling, is the ideal pattern for a motor cycle with an extra 100 lb. or so of machinery, on which the road shocks countered are of an entirely different nature.

No amount of talking can possibly describe the general excellence—the marvellous comfort—the absolute luxury of two spring-frame machines shown below, about the many merits of which riders are unanimously enthusiastic.



THE ZENITH BICAR. 3½ h.p., Price 43 guineas nett cash.



"THE ZENETTE." Price 50 gns., including the marvellous "Gradua" gear.

The marvellous "Gradua" infinite change-speed gear gives any gear from free-engine to 3½ up to 1

"The Motor Cycle" (12th Feb.) says "We were delighted with the way the gear behaved on Muswell Hill. It started the machine from a ndstill and enabled the hill to be climbed without a falter."

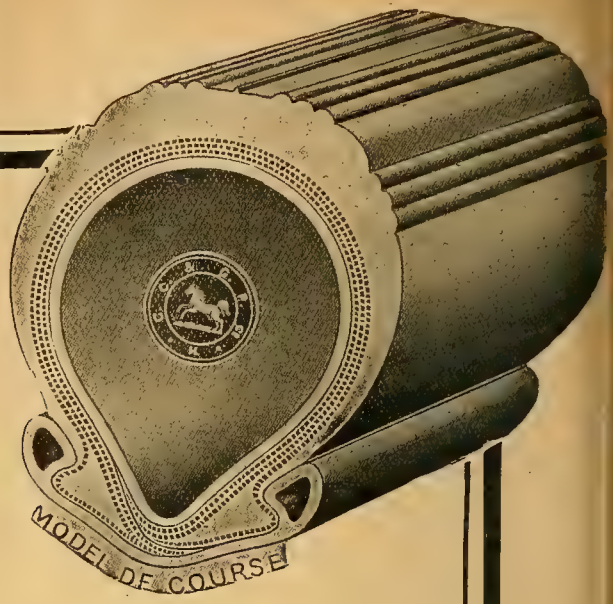
"The Motor Cycle" (19th Feb.) says of a "Zenette" fitted with this gear "During the time the machine was in our hands the gear did every ng which is claimed for it."

"The Motor Cycle" (8th April) says (re Cudham Hill Climb) re the "Zenette" (fitted with "Gradua") "though it came up slowly it did so good form, the variable gear working faultlessly."

"The Motor Cycle" (15th April) says: "It was the first time this variable gear had appeared in competition, and it behaved admirably. I am e that Barnes's performance impressed any prospective motor cyclists that may have been present, more than the wild rush of other machines ch leapt about on the uneven surface of the road in a manner calculated to frighten rather than please."

A "Zenette" fitted with Gradua gear is on view at The Service Co., Ltd. 292, High Holborn W.C.

ZENITH MOTORS, LTD., 101a, STROUD GREEN ROAD, LONDON, N. (Station—Finsbury Park.) Trial runs by appointment ONLY



Take This Course

CONTINENTAL

when specifying tyres.

INSIST IF NECESSARY.

Their resilience absorbs road shocks and greatly minimises the evils of vibration.

Their strength makes them absolutely necessary for Tri-cars, Twins, and Fast Singles.

Their speed (the result of experience gained in the manufacture of highest grade tyres) draws forth praise from all devotees on the sporting side of motor cycling

Again we remark, you may have to insist on Continentals, but they're worth it.

HINTS AND TIPS FOR MOTOR CYCLISTS.

By Road Rider.

(Continued from page 257.)

GEAR AND SPEED TABLE.

190. The subjoined table takes no account of wind resistance, frictional losses, tyre slip, etc. The actual road speeds mentioned would only be reached under the most favourable conditions; the higher the speed the greater are the losses from the above causes. To find what number of revolutions an engine is capable of, get two reliable men to time the machine over a measured distance on a calm day, when the engine is in perfect tune. The formula $\frac{D \times G}{W \times T}$ will then give the actual engine speed attained in revolutions per minute, when D is the distance covered in feet), G the number of revolutions the engine makes to each revolution of the back wheel, W the exact circumference of the back wheel (in feet) measured over the tyre tread, and T the time (in minutes) taken to cover the distance, *e.g.*, a machine does a measured mile in three minutes, being geared 5 to 1, with a rear wheel measuring 7ft. in circumference over the tyre tread. The formula is—

5280 (distance covered in feet) × 5 no. of engins revs. per each wheel rev.

7 (circumference of wheel in feet) × 3 (time in minutes).

Or

$$\frac{5280 \times 5}{7 \times 3}$$

Or

1,257 revolutions per minute.

In actual road practice, with a good engine, 2,500 revolutions per minute is very high speed.

Revolutions of engine 2,000 per minute.

Gear.	Speed with 26in. wheel. m.p.h.	Speed with 28in. wheel.
3 to 1	51.5	55.5
3½ to 1	44.2	47.6
4 to 1	38.6	41.6
4½ to 1	34.3	37.0
5 to 1	30.9	33.3
5½ to 1	28.1	29.6
6 to 1	25.7	27.7
6½ to 1	23.8	25.6
7 to 1	22.1	23.8
7½ to 1	20.5	22.2
8 to 1	19.3	20.8
8½ to 1	18.2	19.6

The above table was published in *The Motor Cycle*, May 8th, 1905.

Goggles.

GENERAL.

191. The accessory makers grow rich by the goggles we break, just as a firm at Norwich is said to thrive on the mustard we leave. Every pair of goggles should therefore be provided with a case—not necessarily a portmanteau. Its lenses should be optically correct, or much damage may be done to the sight. They should not, as is customary, be nipped into place between two sheets of celluloid, which will spring and drop them, but be properly held in spring metal-grooved frames with screw fastenings

GOGGLES WORN WITH PINCE-NEZ OR SPECTACLES.

192. The best plan is to choose a deep barrelled type of goggle, such as the Paris-Vienna, and to wear it over ordinary glasses.

MISTED GOGGLES.

193. A good cure is to wipe the glasses with yellow soap, and then polish with handkerchief, or to clean them with a little alcohol, in which some glycerine has been dissolved. I find myself that the air draught keeps mist off the goggles so long as the machine is in motion, and the condensation only occurs when it is at rest. Therefore, if the goggles are lifted on to the cap at each stoppage, and not replaced over the eyes till the restarted machine has travelled a few hundred yards, no inconvenience whatever from this cause will be noticeable.

GRADOMETER.

194. A great deal of fun may be had by fitting a gradometer to the top tube of a motor bicycle. Owing to the short wheelbase and narrow gauge of a motor bicycle, the results do not compare in accuracy with regular surveys, but they are sufficiently correct to be instructive. Place the machine on a plank which has been carefully laid dead flat with the aid of a spirit level. Procure a small piece of wood, having three flat sides and one curved hollow to fit tube, the edges of the curved side being made of a suitable shape to fit the tank top, and prevent the wood turning sideways. Lay the wood on the top tube, and with a spirit level adjust the top surface till dead level. Clip it to top tube with steel bands, and screw gradometer thereto.

GUARANTEED ACCESSORIES.

195. Always take advantage of the maker's responsibility for the more expensive accessories, sparking plugs, inner tubes, etc. If a guaranteed accessory fails within a reasonable distance the makers will meet the purchaser. One rider of my acquaintance has not bought a new sparking plug for three years through strictness in this matter. Others spend pounds on them.

HOUSING MOTOR CYCLES.

196. Because an inspection pit is unsuited to bicycles and tricars, it does not follow a plain shed is the best garage for them. Backache is the chief drawback to cleaning, repairs, or adjustments. A motor bicycle shed should therefore have a platform to stand machine on, 6ft. long, 2ft. wide, 1ft. 6in. high, approached by an inclined plane, and having two hooks set in the beams overhead, carrying ropes and pulleys.

The best tricar house I have seen was dug out all over to a depth of 18in., and had three rails fitted with check edges and end chocks running across 18in. from the floor.

A motor bicycle may be safely kept in the hall if the petrol tap be closed and does not leak, and if a plug be put in the air vent of stopper to tank. But inform the insurance people.

IGNITION IN SPEED EVENTS.

197. Pending scientific experiments it is generally considered that a plain coil with accumulators and make and break contact, or the high tension magneto, give about equal engine speeds, the trembler coil with wipe contact being hopelessly slower. Some assert that the trembler coil in conjunction with a make and break contact gives the best firing on a hill when the engine slows down a little. But as few hills can slow the modern motor bicycle perceptibly, taking a flying start and in good tune, either the make and break with plain coil, or else the high tension magneto, should be invariably used.

INSURANCE.

198. Insurance is expensive, and forms an over large item in the modest finances of a motor cyclist. The prudent rider will insure against third party risks, as these may be cast upon one by the fault of others and a coroner's jury, and the expense may be very heavy. An insurance policy should be chosen which does not contain a speed limit clause.

JACKS.

199. The lightest jacks are convenient for tricars, quadcars, and sidecars, and if metal ones of normal type are employed, the base should be perforated, so that the jack may be carried upright on the footboard, and attached thereto by a couple of long screws. Ladies object to the jack being carried loose on the front seat. On very light passenger machines use a piece of half inch deal, 16in. by 3in., with a notch to carry axle in one end; to the other end fix a 6in. length of ½in. deal at right angles, girded with light angle irons. This is cheaper and lighter than any jack, and can be easily strapped to some part of the machine.

LICENSES.

200. The Inland Revenue license (carriage tax) must be bought within twenty-one days of first putting machine on road in each year. It expires on December 31st. If bought on or after October 1st only 7s. 6d. Otherwise, 15s.

The driving license runs a full twelve months, *e.g.*, from March 17th, 1908, to March 16th, 1909. It should be carried in the toolbag or accumulator box, as any constable has the power to demand it. Cost 5s.

The fee for numbers is 5s. Numbers are not transferable from one machine to another in the same ownership, nor from the same machine in one ownership to another ownership when sold. When buying an already registered machine, notify the purchase to the registering authority, when the number can be transferred to you for 1s. When selling a registered machine notify the authorities, or any offences of the new owner may be charged to you.

(To be continued.)

QUESTIONS & REPLIES.

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not **must be accompanied with a stamped addressed envelope for reply.**

Power for Passenger Work.

Would a 3½ h.p. Rex fitted with two-speed gear be sufficient to take sidecar and climb most hills? I presume it would so long as the right ratio of gearing is used. Weight of passengers twenty-two stones. Would 5 to 1 high speed and 10 to 1 low speed be about right? Then am I right in understanding that the trouble likely to arise with such a combination is engine heating, owing to reduced road speed, increased load, etc.? If so, is a fan a really satisfactory means of preventing this? Is it worth the power required to drive same, or would careful driving keep me free of this trouble?—P.K., Aberdeen.

A 3½ h.p. with two-speed gear would work well in fairly level country, that is to say, it would take you up a hill of about 1 in 8 to 1 in 10. If you drive carefully we do not think you will be troubled by over-heating. If, however, you are, you will find that a fan will be of service.

Overheating of Tricar Engine.

My engine, a twin-cylinder Kerry on a tricar, with Phœnix two-speed gear, gets very hot. It is air-cooled with two fans, one to each cylinder. There is a large gap between the exhaust valve stem and the tappet—¼in. or more. If I lengthen the exhaust valve stem the springs will be too weak. I presume this is the cause of overheating, as everything else seems perfect. Extra air is sufficient to slow engine, also to stop firing. Can you advise a remedy?—BY 655.

We recommend you to attend to the following points to cure the overheating trouble. Dismount the cylinders and clean cylinder heads and pistons from all carbon deposit, see that the gaps between the exhaust valve stems and tappets do not exceed 1-32in. If you lengthen the exhaust valve stem and leave cotter slot in old position it will have no effect whatever upon the spring. Examine the exhaust cams to make sure they are not worn. Fit new exhaust springs if the springs have become weak through heat, and see that the inlet valve springs have both the same tension, and the valves the same amount of opening. Do not fail to lubricate freely with the best oil.

Concerning Carburetter Adjustment.

(1.) What is the cause of petrol blowing out of carburetter when engine is working, also how to remedy it? (2.) Can you tell me how to raise or lower the level of petrol in jet of carburetter (Brown and Barlow)? (3.) Could you forward me any back numbers of *The Motor Cycle* explaining how to adjust the carburetter?—S.S., Newcastle.

(1.) Probably the level of petrol is too high in the jet, or there is a blow-back past the inlet valve. This cannot be entirely prevented, but if inlet valve spring is too weak it becomes excessive. (2.) On the needle valve is a grooved weight in which the balance-weighted levers rest. To lower the level of the petrol this should be moved further away from the point of the needle. The weight is usually a driving fit on the needle, and the latter can be tapped through. (3.) An article on this subject will appear in the new edition of "Motor Cycles and How to Manage Them," which will be ready shortly.

H. A. Collier, a Brooklands competitor, on the 3½ h.p. Matchless used by Harry Martin in creating new records last week.

Exhaust Valve Seating Cracked.

I have a second-hand M.M engine (85 mm. by 85 m water-cooled), in the exha valve seating of which th is a small crack, which late owner informs me has alw been there. I have tested it w paraffin and find that it leaks co pression, and I shall be obliged if will kindly tell me the best thing do to stop it up.—H.C., Liverpo

We are afraid you can do nothing w the crack, as we have been making quiries of people who have made speciality of repairing cracked cy ders, and they tell us that nothing be done with defects of this kind.

Various Interesting Queries.

(1.) In altering the gear from, say, 4½ to 1 to 3 to 1 it best to do it by getting larger engine pulley or by us the same engine pulley and g ting a smaller belt rim? In which stance will the most power be lost friction? (2.) Have you ever he of any serious accident being cau by any of the auxiliary spring fo (such as are at present sold) bre ing? From some of the adverti illustrations the metal looks v thin. (3.) Should not a twin-cylin bicycle have less chance of skidd than a single cylinder one of the sa power, owing to the more frequ power strokes from each piston? there will not be so much je motion on the driving wheel with twin. (4.) Is magneto ignition as liable with a twin-cylinder as single? I notice some makers use standard the magneto for th singles, but only supply it to spe order for their twins.—C.H., Bradford.

(1.) The gear is best altered by incre ing the size of the engine pulley, as belt obtains a better grip of the pull (2.) We do not remember having he of any serious accident happening fr the breaking of spring forks. (3.) Y a twin-cylinder should skid less tha single-cylinder machine of equal cyl der capacity. (4.) Quite as reliab we do not know the reason why so makers only supply it to special or for twin-cylinder machines, but the f remains that a magneto can be fitted any twin-cylinder engine.

A WORD IN SEASON.

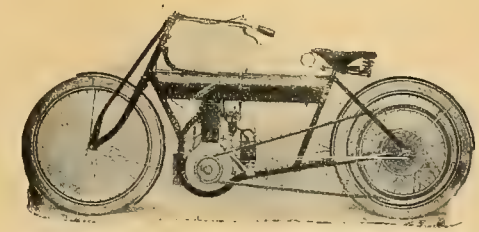
In or out of season you want your machine for comfort and for convenience. You want to be free from care.

The ROC answers these requirements simply because its recognised perfect clutch and ROC speed gear make it "a car on two wheels."

The ROC with its duplex frame and tanks is built on sensible lines. You sit with feet resting firmly on the ground. You can start from standstill on any gradient and turn in any road. You set machine in motion by an easy hand turn from the live back axle.

The ROC system is obviously ahead in these ideas. It is what you want.

"All about the ROC." Descriptive booklet now ready.



Royal ROC 4 h.p., with ball-bearing engine, new military model, clutch and speed gear, hand starting, 48 gns.

Works—114-120, GOLDEN LANE, LONDON, E.C.

In answering either of these advertisements it is desirable that you mention "The Motor Cycle."

10,000 miles without a puncture!

41, WELLINGTON STREET, COVENT GARDEN, LONDON, W.C.

THE PALMER TYRE, LTD., 119, SHAFTESBURY AVENUE, W.C. Nov. 1st, 1907

Gentlemen,—I have pleasure in forwarding you herewith a 2¼in. Palmer Cord Motor Cycle Cover and Tube which has now done nearly 10,000 miles, and as you will see, is as good as ever.

I fitted it to the front wheel of my motor cycle in May, 1906, and took it off to-day to see what it was like inside.

It has only once been touched with the pump since fitted, and has never been punctured.

It has carried me safely through many important competitions, including A.C.C. Land's End to John-o'-Groat's Trial, 1906; London to Plymouth; and six days' trial, 1907; M.C.C. London to Edinburgh, 1907, and also several long tours.

The ribs are not worn much, and both cover and tube look like being good enough for next season.

Yours faithfully, H. GILLARD COVE.

The Longevity of Palmer Motor Cycle Tyres

becomes more than a mere statemen: in face of the above experience; it is a fact!

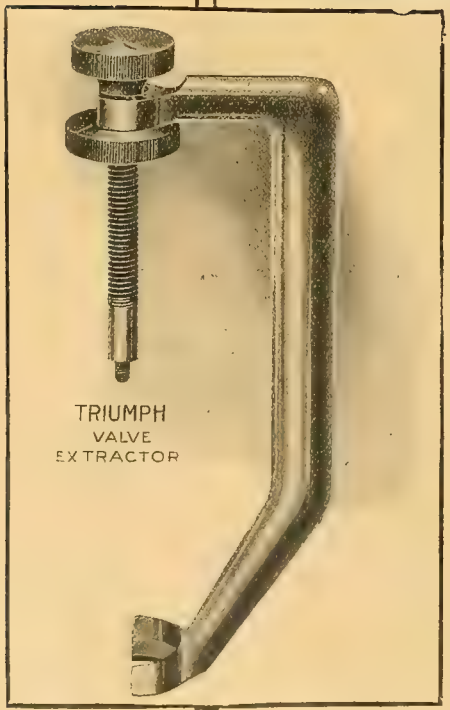
Of Importance TO Riders of '07 Triumphs



Although it is not our custom to supply accessories direct to the public, we feel it our duty to riders of our machines to call their attention to the exceedingly handy and compact device we have brought out for **quick removal of the valves** of our engines. We strongly recommend every rider of the '07 Triumph to purchase one of these neat and beautifully finished little tools; and to facilitate delivery **we will send you** one on receipt of postal order for 5/3.

WRITE now to the

Triumph Cycle Co., Ltd., Coventry.

Overheating and Loss of Power.

My motor cycle (a 3½ h.p. Brown, magneto) overheats badly, and is not strong on hills. When I stop, smoke issues from extra air inlet of uretter. Have had engine down cleaned, ground valves, also tried ous adjustments in carburetter little improvement. I have read the articles on overheating with rest, but they do not seem to help case. Would stronger springs to es be of any good?—F.T., Kent.

ly a smaller jet might help you, would be a good plan to check vel of the petrol. Be careful to a good brand of oil and use of it. You do not mention which ou are using, which might have us. If the valve springs are it is, of course, desirable that they be renewed. Are you sure that achine is not overgeared for your ? Smoke usually issues from air inlet of carburetter of all nes when at rest immediately run, and inlet valve is raised.

Respecting a Wipe Contact-Maker.

Having been troubled by misfiring due to sparking at the contact maker, which is of the usual wipe pattern, I beg your aid as to a cure. The ex- g pieces consist of a fibre com- itor with brass segment, and the e with a case-hardened knob. hardening has fused through. the mild steel is now making act, and much sparking occurs. t is the best combination of ls for this important function? rpose re-hardening the existing , but if a more suitable metal prevent a recurrence of the ole I shall be greatly obliged for information.—C.G.K., Glasgow.

ouble may be cured by fitting a lade, and be prevented in future ng the contact breaker case with grease to prevent sparking. We know of more suitable metals those you have in use. It is and advisable to carry a spare

Electric or Acetylene Headlights.

(1.) Do you know anything of the Osram electric bulb, whether it is reliable for the purposes of a headlight on a motor bicycle? (2.) The makers ribe the 8 volt accumulator sold the lamp as of about eight 's capacity. Does this mean t hours continuous light? (3.) you advise the purchase of such mp in preference to an acetylene tlight, and if so should I find tricity as reliable as acetylene (4.) I do very little night rid- so would dry batteries be pre- ble to accumulators to save ex- e of charging?—A.H.W., Can- ury.

n electric bulb in a good lamp a very fair light, but is not equal tylene. It is an advantage to be o switch on at any time without nting, however, and for intermit- se for short distances it saves ouble of constantly cleaning out the gas generator. (2.) Yes, doubtless the accumulator would give a current for about eight hours continuously. (3.) Personally, we prefer an acetylene lamp, but you must put the pros and cons together and decide which suits your particular requirements the better. (4.) Dry batteries would not last long. Accumulators must be used, as the former are only suitable for intermittent work.

Commencing Motor Cycling.

[?] I am considering the purchase of a motor cycle, and at times I intend using a sidecar with it, and should be glad to have your valuable advice in the selection of a machine. I am a novice at motor cycling, but a rider of above twenty years of the pedal bicycle. (1.) What h.p. would be required to take sidecar up hills without pedalling? (2.) What kind of engine do you advise for the use of motor cycle by itself, and also with sidecar? (3.) Belt or chain

C. R. Collier on his old International Cup Racer. This was the machine he rode at Brooklands on Easter Monday.

drive? (4.) Lowest speed with whatever engine you mention? (5.) Cost of petrol and lubricating oil per 100 miles? (6.) Cost of petrol and lubricating oil per 100 miles with sidecar? (7.) Is there an extra license for sidecar, and if more for the Lowen sidecar, which has two wheels? (8.) Is magneto ignition best?—W.H.R., Merton.

(1.) The minimum horse-power for sidecar work would be 3½ with two-speed gear. (2.) If you care to send us a numbered list of the engines which you think would suit you, keeping a copy by you for reference, we will place them in order of merit. The same remarks apply to advice with regard to the purchase of a machine. (3.) If you intend to use a sidecar a great deal, chain drive would be better. (4.) Most engines will slow down to about six miles an hour on level roads. (5 and 6.) About 1s. 6d. and 2s. respectively. (7.) There is no extra license for the ordinary type of sidecar. If, however, the latter has two wheels the whole combination must be registered as a motor car. (8.) If cost is no object, magneto ignition is preferable.

Current Consumption of Coil.

[?] I have a trembler coil, used with make and break contact breaker, which uses what I think to be an excessive quantity of current, *i.e.*, it runs a 15. ampère 4 volt accumulator down in about 120 miles. Single cylinder engine of 2¼ h.p. My previous trembler coil would work for about three times the distance from exactly the same accumulator. Would a fine insulated wire resistance, say gauge 30—I could gauge the length—save current and still be efficient?—J.R., Birkenhead.

Either the coil is abnormally extravagant or the trouble lies in the accumulator itself, which is suffering from an internal short circuit. Do you find that accumulator runs down automatically if it is not connected up when out of the machine? If it does, the trouble we have suggested is undoubtedly the case, and the only alternative is to send it to the makers to be repaired. You will find that you can improve the consumption of the coil somewhat by adjusting the trembler slightly, that is to say, enough to make a good contact without causing misfiring, but not too firmly. A resistance will not save the current but will waste it. If the trouble is in the coil it is probably due to the condenser being out of order.

READERS' REPLIES.

Permit me to thank you, and also your correspondent A. D. Walker and others, for the trouble taken over my query *re* Phœnix Trimo. Besides local friends, a reader of your paper in Wesel, Germany, also wrote to try and help me, but were all unable to do so. I have, however, at last found out my fault, and it has not occurred again. When I bought my Phœnix Trimo some years ago there was a funnel fastened on to the bottom air intake of the carburetter through which hot air was drawn from the cylinder. This, after doing duty over 18,000 miles, came off, and in my wisdom I decided it was no good, so did not replace it. The carburetter then got all cold air, with the result that either the carburetter or pipe to inlet became frozen. Since I have replaced the pipe I have had no more trouble. I can recommend the Phœnix idea of soldering up the slots of the jet and boring only one hole in centre, as in the above distance I have never yet had the nipple stop up.—A.M.

"THE AUTOCAR" contains each week much interesting information which, although written in regard to motor cars, is also applicable to tricars and motor bicycles. It is published weekly, price 3d., and can be obtained from all newsagents and bookstalls.

The Motor Cyclists' Ideal.

The result of our plebiscite we expect to be able to publish in the special spring number of *The Motor Cycle*, dated May 6th. This will make the special issue doubly attractive, and copies of this number should be ordered early.

Coming Events.

Permits have been granted by the Auto Cycle Union for the following events: Open Hill-climb, April 25th, Herts County A.C. S. J. Ellis, 40, High Street, Watford.—Open Hill-climb, May 9th, Essex M.C. H. Fuller, Wyndale Road, Woodford.—Motor Cycle Races, Whit-Monday, St. Albans. A. F. Slater, 1, Bedford Park Road, St. Albans. Full particulars may be obtained of these events by writing to the respective secretaries.

The Motor Union and Level Crossings.

The Motor Union opposed the confirmation by the Board of Trade of the Barton-Immingham Light Railway Order as proposed by the Light Railway Commissioners. The draft order authorised an important main road to be crossed on the level. The Board of Trade have now officially informed the Motor Union under date April 10th, "That they have decided to require the promoters to provide a bridge in lieu of the proposed level-crossing of the road numbered on the plan 64 in the parish of Barrow-on-Humber." In view of the many complaints received as to the dangers, delays, and inconveniences occasioned by level crossings, it has been determined to oppose the construction of any more level crossings in important thoroughfares.

Always Carry Goggles.

A pair of goggles should always be carried ready for wearing if necessary. Even after two days of fine weather the dust becomes very pronounced, and at this time of the year the wind is occasionally biting, and after a long ride without goggles makes the eyes ache. Driving against rain and wind is almost impossible unless goggles are worn.

Well-known Motor Cyclist Married.

A well-known motor cyclist was married on Wednesday, April 22nd, at Holy Trinity Church, Northwood, Middlesex, in the person of Mr. B. H. Davies, who is well-known both as a contributor to *The Motor Cycle* and rider. His bride was Miss Frances Helen Hodgkinson, daughter of the late Lieut. C. F. T. Hodgkinson, R.N., and of Mrs. Dent, Reisterstown, Maryland, U.S.A. The ceremony was performed by the Rev. R. F. Dale, of Keble College, Oxford, assisted by Canon Hodgkinson, of Lincoln, the Rev. H. Davies, of Durham, and the Rev. E. B. Backhouse, vicar of Northwood. A reception was afterwards held at Northwood Hall, the residence of the bride's grandmother, Mrs. Pickersgill-Cunliffe, and the newly married pair left for the South Coast in the afternoon. The bridegroom has secured many motor cycling awards, including the longest authenticated ride in six consecutive days, and Edinburgh and End-to-end medals, while last year he won first awards at the A.C.U. Annual and M.C.C. Members' Hill-climbs. We understand Mr. and Mrs. Davies will probably compete in the End-to-end ride on a passenger motor cycle.

The Late Michel Werner.

We regret to record the dea Monte Carlo of Monsieur M Werner, one of the original par in the late firm of Werner F Paris, the originators of the W motor bicycle. Monsieur We brother died about three years ag

Motor Cycling for Health.

We are very pleased to be ab state that our medical readers taken up the above subject very e siastically, and the many do opinions of motor cycling will this feature (to be included i special issue of May 6th) not the interesting.

The London-Edinburgh Run.

Intending competitors in the L to Edinburgh Run who are not a members of the Motor Cycling should communicate with Mr Candler, 1, Lime Grove, Shep Bush, London, W., and not Mr. Fry, the assistant trials hon. sec

Signposting Watling Street.

The R.A.C. has decided to pre ward the signposting of W Street. The secretary, in his r report, says the road is in ex condition. We venture to diff any rate with regard to portions route. It is good from Welling Gailey, with the exception o George's, which can be avoided, and loose through Brownhills, lumpy near Wilnecote, and a far appears to enjoy the use of the way just south of High Cross. road would make a splendid t route from London to the Welsh if it was repaired where necessar

Competitors in the Brighton and District Motor Cycling Club's Hill-climbing Competition.

Policeman Stops a Climb!

A dreadful occurrence took place on Westcombe Hill, Blackheath, the other day, where Laurence Mounter, of Westcombe Park, steered a motor cycle straight towards a policeman. At the Greenwich Court, where Mr. Mounter appeared on the charge of driving a motor cycle in a manner dangerous, etc., P.C. Yorke, 642 R, said that defendant nearly collided with his bicycle, and he fell in consequence. The magistrate (Mr. Hutton): "Then he upset the law." (Laughter.) Witness: "Yes, sir." Defendant, who said that his machine was incapable of doing twenty miles an hour—he actually had to get off and push it up-hill—was fined 20s. and 2s. costs.

Road Warning.

We are informed by a local reader that motor cyclists will do well to drive carefully in the Boroughbridge district. Boroughbridge is on the main London to Edinburgh Road, situated north of Wetherby.

Police Trap in the I.O.W.

A resident in the Isle of Wight writes that there is a police trap on the road from Ryde to Newport, at the top of Wootton Hill. The trap is set at the foot of a hill which tempts motor cyclists to accelerate speed to climb it satisfactorily.

Speed Limit in Belfast Refused.

In a letter to the Town Clerk, Belfast, the Local Government Board has refused to grant a speed limit on motor cycles and cars in the City of Belfast. The application for a ten miles speed limit was made a month or two ago.

Race Meeting at Canning Town.

About 3,000 spectators witnessed the race meeting held on the Canning Town track on Good Friday. C. R. Collier and H. V. Colver, both riding powerful Matchless machines, had what might be termed a rubber in matches. This consisted of a mile race, a three miles race, and a five miles pursuit race. Collier easily won the mile event in 1m. 27⅘s. The three miles match proved far more exciting. The two competitors kept together practically the whole way, but gaining slightly towards the finish Colver finished three seconds ahead in 3m. 42⅖s. The five miles pursuit race was also a very evenly contested event, and for some time neither gained any appreciable lead. Collier, however, gradually gained, and finished 1⅕s. ahead in 6m. 4⅕s. Thus the rubber went to Collier with two events to one. An interesting item was the five miles race for touring machines, with engines not exceeding the equivalent of 90 by 90, 26in. wheels, and geared at not more than 4 to 1. F. E. Barker, 2¾ h.p. Rex, won in 7m. 20⅘s., H. A. Collier, 3½ h.p. Matchless, followed a short distance behind, and H. V. Colver, 3½ h.p. Matchless, made a good third.

High Speeds on 2¾ h.p. Machines.

The five miles handicap for machines with engines not exceeding 76 by 76, was won by H. V. Colver (Matchless), 5s. start, rather easily in 5m. 52⅘s. H. A. Collier (Matchless) was second, and C. E. Bennett (Mansfield) third. C. E. Bennett won the five miles scratch race for 76 by 76 engines rather comfortably in 5m 55⅕s. Getting a good start he increased his advantage and won from C. R. Collier by 300 yards. H. V. Colver was third about 100 yards behind Collier. H. V. Colver made an attempt on the ten miles world's record, but he never attained the necessary speed, and finished 31s. behind record time in 11m. 55⅗s. Barker, who rode in the tourist handicap is known as the grass track rider.

FUTURE EVENTS.

April 25—Hertfordshire County A.C. Open Hill-climb for Motor Cycles.
,, 29—A.C.U. Quarterly Trial.
May 2—M.C.C. Members' Hill-climb.
,, 6—"The Motor Cycle" Special Spring Number.
,, 9—Brooklands Motor Races.
,, 9—Essex M.C. Open Hill-climb.
,, 12-18—Auto Cycle Club of France Reliability Trials.
,, 16—A.C.U. Annual Hill-climb.
June 5-8—M.C.C. LONDON-EDINBURGH RUN and return for Schulte Cup Competition, and special cup for motor-bicyclists.
,, 27—M.C.C. Inter-team Trials for "The Motor Cycle" Fifty Guineas Challenge Cup. Prospective competitors: Motor Cycling Club, Coventry M.C., Great Yarmouth M.C.C., and Birmingham M.C.C.
,, ——A.C.U. 24 Hours' Ride.
July 4—Essex M.C. Open 200 Miles Non-stop Run.
,, 13-18—A.C.U. LAND'S END TO JOHN-O'-GROAT'S SIX DAYS' RELIABILITY TRIAL.
,, 25—Motor Cycling Club's Petrol Consumption Tests.
Aug. 3-4—M.C.C. Run from London to Land's End and Back for Charles Jarrott Cup.
Aug. 8—Essex M.C. Open Race Meeting at the Stadium, Shepherd's Bush, W.

F. E. Barker (2¾ h.p. Rex) winner of the Five Miles Tourist Handicap at Canning Town on Good Friday last. Time, 7m. 20⅘s.

A Hill-climb in South Australia.

A hill-climbing contest held on the 14th ult. at Melbourne, South Australia, resulted as follows: 1, C. D. Sheppard, 3 h.p. N.S.U., 9m. 53s., 26.31 points. 2, W. Crowle, 3 h.p. N.S.U., 9m. 28s., 25.53 points. 3, H Behrens, 3 h.p. N.S.U., 10m. 12s., 25.41 points. 4, N. Jackson, 3 h.p. Lewis, 9m. 40s., 24.14 points. 5, A. E. Lykke, 3 h.p. Lewis, 11m. 58s., 22.90 points. 6, C. Richards, 3 h.p. N.S.U., 11m. 49s. 7, D. Fulton, 4 h.p. F.N., 11m. 49s. 8, F. H. Taylor, 2¾ h.p. Minerva, 14m. 18s. 9, V. F. Hall. 3 h.p. Rover, 11m. 26s.

The M.C.C. London—Edinburgh Run.

We exceedingly regret that through a misinterpretation of a paragraph in the programme of the M.C.C. London-Edinburgh run we published a paragraph last week which would lead our readers to believe that Mrs. Claude Marshall, who is kindly entertaining the competitors in the above event to breakfast as her guests at the George Hotel, Grantham, is the proprietress of the hotel. We hasten to inform our readers that Mrs. Claude Marshall has nothing to do with the George at Grantham, and is one of the lady members of the M.C.C., and the wife of the ex-Trials hon. sec. We apologise both to Mr. and Mrs. Marshall and the other members of the Motor Cycling Club for this very regrettable error.

Useless Advertising.

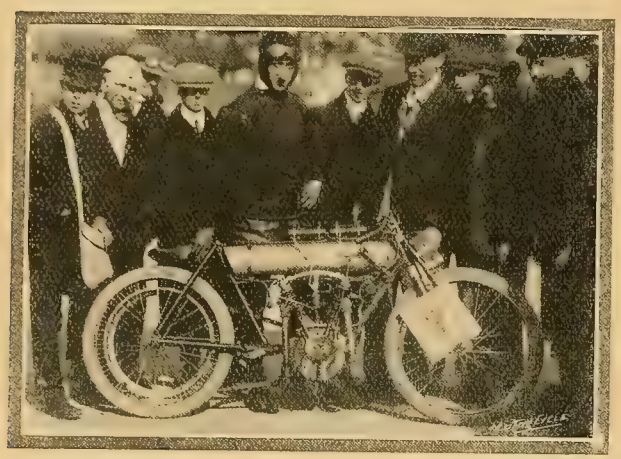
As an instance of the nuisance occasioned by the delivery of circulars and catalogues, one of our staff received by post on the 15th inst. four circulars in separately stamped envelopes bearing the same address, and all containing the same matter, which related to a book on touring in Wales. There were several others by the same post from other sources, but the four above-mentioned prove the useless waste of postage stamps and printed matter by some firms on what can only be styled useless advertising.

Motor Cycles in Germany.

At the beginning of the current year the various German States possessed 19,573 motor cycles for the conveyance of persons, and 235 for the transport of goods. The figures for January 1st, 1907, were 15,700 and 254 respectively. It is interesting to learn how the cycles were distributed. Prussia alone owned 10,588, Berlin's share was 394 of the 10,588. Bavaria possessed 2,772, Saxony 1,888, Wurtemberg 857, Baden 834, Hesse 396, Mecklenburg-Schwerin 191, the Grand Duchy of Saxony 93, Mecklenberg Strelitz 24, Oldenburg 200, Brunswick 169, Saxe-Meiningen 53, Saxe-Altenburg 63, Saxe-Coburg-Gotha 45, Anhalt 141, Schwarzburg-Sonderhausen 20, Schwarzburg-Rudolstadt 19, Waldeck 22, Reuss (Senior line) 9, Reuss (Junior line) 36, Schaumburg-Lippe 3, Lippe 25, Lübeck 33, Bremen 64, Hamburg 227, and Alsace-Lorraine 800. There are 169 commercial motor cycles in Prussia.

First Motor Cycle Race at Brooklands.

ON Easter Monday motor cyclists had an opportunity of trying their mounts for the first time in open competition on the famous track at Brooklands. The racing was confined to one event, viz., a five and a half miles race, the entrant of the winner to receive 20 sovs. or a cup at his option,



W. Cook (7-9 N.L.G. Peugeot), winner of the motor cycle race at Brooklands. His speed for about 5½ miles was equal to 63 miles an hour.

and the entrant of the second 5 sovs. or a medal at his option. For motor bicycles of which the engines, if twin-cylinder, do not exceed 80 mm. by 98 mm. for each cylinder. No less than twenty-four entries were obtained. The remaining five events were all for motor cars, and will be fully dealt with in *The Autocar* for the 25th inst.

Competitors in Order of Finishing.

Entrant, rider, and machine.	Bore.	Stroke.
Mr. A. G. Forster (W. Cook), 7-9 h.p. N.L.G.-Peugeot	80	98*
Mr. E. Kickham (owner), 7 h.p. Leader-Peugeot	80	98*
Mr. C. R. Collier (owner), 6 h.p. Matchless-J.A.P.	76	95*
Mr. W. G. McMinnies (owner), 3½ h.p. Triumph	84	86
Mr. W. H. Wells (owner), 5 h.p. Vindec Special	75	76*
Mr. G. Schink (M. Geiger), 6 h.p. N.S.U.	75	90*
Mr. H. Bashall (J. H. Slaughter), 3½ h.p. Triumph	84	86
Mr. J. C. Davis (owner), 5½ h.p. Rex	76	81*
Mr. E. C. W. FitzHerbert (owner), 6 h.p. F.N.	50	57†
Mr. F. W. Applebee (owner), 5 h.p. Rex	76	80*
Mr. H. Reed (owner), 7 h.p. Dot-Peugeot	80	98*

Mr. C. Hurford (G. Adams), 6 h.p. Griffon	75	80*
Mr. J. B. Hanafin (owner), 5 h.p. Vindec Special	75	76*
Mr. O. C. Godfrey (owner), 5 h.p. Rex	3in.	3 9/64 in.*

* Twin-cylinder. † Four-cylinder.

Brooklands Motor Cycle Race. Competitors and their machines in the paddock.

Although only twenty-one numbers were put up on the indicator board when the bell rang, the full number of entrants were on parade. The rushing past of such a large number of machines at fast speed created considerable enthusiasm among the spectators.

All the riders were started together, and, after one or two failures to get the engines going, W. Cook (7-9 h.p. N.L.G.-Peugeot) got away finely, and had a good lead at the members' bridge, about one-third of a mile from the start. He continued to forge ahead,

First Motor Cycle Race at Brooklands.—

and never looked like being challenged, and on coming to the fork to start on the last lap he had about one-third of a mile lead. Ultimately he ran in an easy winner by about five-eighths of a mile. The third man, C. R. Collier (6 h.p. Matchless-Jap), was about one hundred yards behind the second, E. Kickham (7 h.p. Leader-Peugeot, a machine fitted with an engine of the same size as the winner's). The winner's speed was sixty-three miles per hour, and his machine was fitted with a gear ratio of 2⅝ to 1.

He stated to our representative that he rode thirty miles outright on the Tuesday before the race at an average speed of sixty-eight miles per hour, but there was no wind blowing then, whilst during the race a strong cross wind was experienced. After the third man had got home the others came in very rapidly with gradually diminishing intervals, and it became difficult to distinguish them, owing to the speed and small number plates they carried. Altogether, barring the runaway win, the race was successful, and much appreciated by the crowd.

Reference to the table of bores and strokes will show that the two largest engines finished first and second, their cubical capacity being 984 cubic centimetres in comparison to Collier's 861 cubic centimetres and McMinnies's 476 cubic centimetres. Big engines do not always win, but, other things being equal, it is only natural that they should do nine times out of ten. This being the case, we hope to see handicap racing adopted at Brooklands for motor cycles, about which we shall have more to say next week.

Motor Cyclists' Meet at Richmond.

Some of the 200 Northern motor cyclists who attended the inter club's meet at Richmond, Yorks., on Good Friday.

THE second annual meet of motor cycle clubs in the North-eastern district took place at Richmond on Good Friday, and was a successful gathering. The weather was everything that could be desired—brilliant sunshine, cool air, and dry roads. About two hundred motor cyclists put in an appearance: the Newcastle and District M.C.C., the Leeds M.C.C., the Bradford M.C.C., the Hull and District M.C.C., the Sheffield and Hallamshire M.C.C., the Middlesbrough and District, and the Hartlepool M.C.C., contributing contingents. This year the meet was more formal and businesslike than the initial venture of last year, a new and important departure being the conference in the town hall, at which various matters affecting motor cyclists were discussed, particularly the vexed question of affiliation to the A.C.U. Mr. E. L. Bates, of Newcastle, whose enthusiasm for the sport is well known, was elected chairman of the conference and president of the meet, and it was decided to make the meet an annual affair with Richmond as a rendezvous. Mr. G. W. Liddle, the secretary of the Middlesbrough M.C.C., under whose auspices this and last year's meetings were arranged, was appointed secretary of the meet. Mr. S. W. Carty initiated a discussion on the relation of clubs towards the A.C.U., suggesting that clubs ought to seek affiliation, although they might not approve of the management of the A.C.U. A new body governing motor cycling would be an expensive and an uncertain undertaking, while the only way to improve the A.C.U. was to join that body, support the reform movement and get grievances remedied, and so get the A.C.U. thoroughly representative of and useful to motor cyclists.

Mr. G. E. Vint, president of the Bradford M.C.C., supported, urging motor cyclists to make the best of the A.C.U. He agreed that by combining they could carry out the reforms that were needed. A rival body would be detrimental to the sport, and would deprive members of the affiliated clubs of their right to be licensed to ride in open competitions. The chairman also supported Mr. Carty's point of view. An official photograph was afterwards taken for *The Motor Cycle*, together with a group of leading officials, and a pleasant afternoon was spent by the motor cyclists in and around the fine old Yorkshire town, which is so popular a resort for cycling meets.

THE M.C.C. EASTER TOUR.

The Motor Cycling Club Easter tour, despite the inclemency of the weather, was well attended. The Red Lion, Salisbury, was fixed upon as headquarters, and on Saturday and Sunday excursions were made to places of interest in the surrounding district. On Sunday the members experienced a heavy snowstorm during the return journey from Swanage. Motor cycles and cars were fairly evenly represented. On Sunday Messrs. R. M. Brice, W. H. Wells, and others left Salisbury for town to attend the race meeting at Brooklands on the Monday. The tour was voted a most successful one, despite the bitterly cold easterly winds which prevailed.

We hope to give a more detailed report and one or two illustrations in next week's issue. Up to the time of going to press our photographs had miscarried.

CLUB NEWS.

Cardiff Motor Club.

The opening meet took place on Good Friday at Tintern, Wye Valley. Members and friends numbering well over thirty sat down to lunch at the Anchor Hotel, and after visiting the historic abbey continued the journey up the valley of the Wye as far as Monmouth, where the river was left, and the party made for Raglan, where tea was served at the Crown Hotel, the party then making for home *viâ* Usk and Newport.

Ayr and District Motor Cycle Club.

The opening run was held on the 15th inst. to Largs—a distance of over thirty miles. The party, consisting of seventeen members, headed by the captain, Mr. John Hourston, left the Burns Statue Square at 10.30 a.m. Largs was reached about midday, and after a pleasant interval of four hours the return journey was commenced.

Bradford Motor Cycle Club.

The first competition was a fast and slow hill-climb on Long Hill. The slow climb up the hill proved a trying test, and few were successful in making the ascent at a walking pace with their engines running. Out of fourteen entrants only six competitors finished the dual test, these being in the order of merit as follows: T. Briggs (3½ h.p. Phelon and Moore), G. E. Tennant (5 h.p. Vindec), H. Wheelwright (3 h.p. Humber, P. and M. two-speed), A. Barraclough (3½ h.p. Phelon and Moore), E. Slater (3½ h.p. Triumph), and E. Merrall (6 h.p. Jap). Mr. W. Musgrave, the assistant secretary, acted as starter, and Mr. A. H. Forbes and Mr. B. Read, hon. sec., were the timekeepers.

M.C.U.I. (Ulster Centre).

A committee meeting of this centre was held at the Grand Central Hotel, Belfast, on the 15th inst. Mr. R. Graham Lindsay was elected chairman for 1908, and Mr. J. S. Garrett vice-chairman.

T. Ireland wrote resigning his seat on the committee owing to his removal to Birmingham, and the resignation was accepted with much regret. J. Stewart was co-opted to fill the vacancy.

May 1st was suggested as the date of the conference with the Dublin Centre at Dundalk, and Messrs. R. G. Lindsay, J. S. Garrett, J. Holden, and A. W. Hamilton were appointed delegates.

The following fixtures were arranged: May 9th, hill-climb at Carnmoney; May 23rd, reliability non-stop run to Ballycastle, with hill-climb on the way.

S.E. Auto Cycle Association.

At a meeting at the Green Man Hotel, at Southend, on the Sevenoaks Road, the new S.E.A.A. (late Lewisham A.C.) was formerly inaugurated on the 16th inst.

Mr. W. Simms, of Blackheath, was appointed to the chair, and, following some interesting remarks, explained the *raison d'être* of the meeting, after which he called upon Mr. H. Bickingham Renner to give an address on the aims and objects of the new Association. This was followed by a discussion, the following resolution being carried unanimously, "That the S.E. Auto Cycle Association be hereby formed." It was resolved that the A.C.U. be advised as to the change of title. Mr. Renner was elected hon. sec. and treasurer *pro tem.*, and two delegates to the A.C.U. were appointed.

It was also agreed that the yearly subscription to the association be half a guinea for town members and five shillings for country members, and that there be no entry fees in the case of members joining before the 30th inst.

Newcastle Motor Club.

An extraordinary general meeting was held in Newcastle-on-Tyne on Tuesday, the 14th inst. Mr. J. E. Hodgkin, secretary of the North-Eastern Automobile Association, intimated that in a private interview with Mr. F. Straight, of the A.C.U., he advocated the formation of a Northern Centre of the A.C.U., and mentioned that as the N.E.A.A. embraced the majority of northern motor cyclists it was in a strong position to take the initiative in the movement.

It was decided to affiliate with the North-Eastern Automobile Association, and request that body to appeal to the A.C.U. to form a Northern Centre.

A handsome trophy in the shape of a beautifully-designed silver shield has been presented to the club by Mr. Alan Robson for a hundred miles non-stop run.

Essex Motor Club.

The opening run was voted a pronounced success, ov forty members and friends attending. After luncheon t party adjourned to a shady spot, where a photograph w taken. Members then split up into small parties, and pr ceeded to Bishops Stortford to tea, *viâ* Braintree and Du mow. Members are reminded of the paperchase on Satu day next, when some excellent sport is promised. The har will leave the Castle at 3.30 p.m., and a course of abo twenty miles will be laid, the finish being within a few mil of Epping. Tea will be arranged for at the Cock Hotel. T winner will be rewarded with a free tea. On the followi day the club run is to Southend, and, if the weather is fin a large number are sure to attend.

The club hill-climb will take place on Saturday, May 9t and the formula will be on a new and unique system, which it is hoped to bring each competitor on to the starti line with the same chance of winning. There will be thr classes for single and three for twin-cylinder machines. T weight of each single-cylinder machine and rider must not less than 320 lbs. and each twin 340 lbs.; lightweigh 250 lbs. In the event of the lightweights not reaching t top, the machine which goes furthest to be the winner. pedalling or starters allowed. Entry forms and particul from the trials hon. sec., Ernest J. Bass, Crown Hotel, Ong

Lincolnshire M.C.C.

The snowstorm which swept over the county affected hill-climb at Waddington of the L.M.C.C., for several of riders having long distances to travel shirked the journ Out of the sixty-seven entries there were, however, a gr many competitors, and some excellent times were made.

The hill is exactly half a mile long, and has a fine gradi

Club News.—

Southern M.C.

The following gentlemen have accepted office for 1908: President, C. Howlett; vice-presidents, Messrs. W. Howlett, Col. Mark Mayhew, I. H. Mitchell, Staplee Firth, H. L. Doulton, and F. C. Patterson; chairman, A. Vicars; vice-chairman, B. Grottick; committee, Messrs. Pugh, Brodie, Patterson, Connor, and Worger; sports secretary, A. W. Holt; social secretary, A. C. Belcher; reporting secretary, K. Davies; general secretary, W. L. Lorkin; auditors, J. W. Cufley and G. Fisher; riding officer, F. S. Fitch; Motor Union representatives, Messrs. Vicars, Lloyd, and Lorkin.

The Secretary read a very satisfactory report at the meeting, which showed that this club did a lot of good work during 1907, and this year it hopes to again double its membership. A number of runs and competitions have been arranged for 1908.

Brighton and District M.C.C.

The above club held its first competition for 1908 on Saturday, the 11th inst., when a hill-climb was successfully run off on Saddlescombe Hill. The event was divided into three classes, viz.: I., single-cylinder machines; II., multi-cylinders; and III., passenger vehicles. The winner in each class was decided by the A.C.U. formula $\frac{W}{C \times T}$, and the results as follows:

CLASS I.—SINGLE-CYLINDERS.

	Position on formula.	Time, giving fastest man as zero.
W. J. Coleman (2½ h.p. Triumph-Jap)	1st	12s.
C. R. Robinson (1¾ h.p. F.N.)	2nd	43s.
T. Attwater (2½ h.p. Jap)	3rd	20s.
A. Yapp (3¼ h.p. Rex)	4th	14s.
*W. R. Farley (3½ h.p. Triumph)	5th	X
E. L. Waters (3 h.p. Rover)	6th	19s.
W. J. Wormald (3 h.p. Rover)	7th	36s.

CLASS II.—MULTI-CYLINDERS.

W. Brett (3½ h.p. Alcyon)	1st	4s.
T. Rollon (3½ h.p. F.N., four-cylinder)	2nd	40s.
*R. W. Cartwright (5-6 h.p. Rex)	3rd	X
H. B. Gates (4½ h.p. Minerva)	3rd	6s.
H. Saunders (5-7 h.p. Bat-Jap)	5th	19s.
H. Clifton (5 h.p. Roc)	6th	40s.
J. H. Best (7-9 h.p. Buchet)	Failed—misfiring.	

CLASS III.—PASSENGER VEHICLES.

Athol Lambert (5-6 h.p. Phœnix Trimo)	1st	40s.
*R. W. Cartwright (5-6 h.p. Rex and sidecar)	2nd	X

* Denotes fastest man in each class.

Everything was carried out in a most successful manner, and the sport provided was much enjoyed by members and onlookers. Timekeepers, Messrs. Smith and Mertens; starter, C. E. Sambrook. After the event the members made their way to the Chinese Gardens at Hurst for tea.

Stockport and District M.C.C.

On Saturday, the 11th inst., the opening run of this newly formed club was held to Knutsford. About thirteen members took part in the run, which was much enjoyed. On the following day twelve members took part in a run to Chester. Next Saturday (25th inst.) the run is to Great Budsworth, leaving headquarters, Mersey Hotel, at 2.30. April 26th, run to Whitchurch, leaving headquarters at 11 o'clock. All motor cyclists will be made welcome. The hon. sec. is H. Marsden, George's Road, Stockport.

Lincolnshire M.C.C. (Scunthorpe Centre).

A very successful hill-climb took place on Trafford Hill This was the opening event of the new centre. Mr. Fletcher acted as starter and Mr. Jackson was timekeeper. The following are the results:

		Figure of merit
1.	Mr. Lingard (3 h.p. Fafnir)	33.0
2.	Mr. Guessford (3 h.p. Fafnir)	32.7
3.	Mr. Spavin (3½ h.p. Fafnir)	29.3
4.	Mr. Barley (3½ h.p. Fafnir)	27.9
5.	Mr. Cook (3½ h.p. Minerva)	26.9
6.	Mr. Cordock (2¾ h.p. Kerry)	23.0
7.	Mr. Atkinson (6 h.p. Jap)	21.9
8.	Mr. Heseltine (5 h.p. Rex)	19.7
9.	Mr. Singleton (3 h.p. Fafnir)	17.4
10.	Mr. Brooke (5½ h.p. Rex)	not weighed
11.	Mr. Simms (3½ h.p. Brown)	,,

Mr. Lingard is the winner of singles, and Mr. Atkinson winner of twin class.

Bradford M.C.C.

At the last committee meeting the following programme for 1908 was definitely decided upon:

May 3rd.—Speed-judging competition. Meet at Bolton Bridge at 11 a.m. Prize, pair of bronzes, value £2 2s.

May 10th.—Minor hill-climb at Green How Hill. Meet at Pateley Bridge at 12.30 p.m. Prize, club gold medal.

May 24th.—200 miles reliability trial, Bradford to Keswick *viâ* Kendal and back. First prize, N.S.U. cup, value £8 8s., and club gold medal, value £1 1s.; second prize, club gold medal; third prize, bronze medal.

June 21st and 22nd.—Bradford and Edinburgh and back reliability trial. First prize, Triumph cup, value £10 10s., and gold medal; second prize, club standard gold medal; third prize, ditto. All who complete the journey and return within the twenty-four hours, bronze medal.

July 26th.—Hill-climb for Dyson shield, value twenty guineas, and club gold medal; second prize, club standard silver medal.

August 23rd.—100 miles circular non-stop run. Prize, club gold medal.

It is probable that a Bradford to London competition will be arranged later, and also further minor competitions. The officials of the club will be pleased to hear from other clubs or persons who will assist in the checking for the Bradford and Edinburgh run. Letters should be addressed to Mr. Bernard Read, the hon. secretary B.M.C.C., Imperial Hotel, Bradford.

A good turnout on the occasion of the first run of the newly formed Stockport and District Motor Cycle Club.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Outside Flywheels.

[3256.]—With reference to Mr. Atking's letter on external flywheels, he may be interested to know that about ten years ago, I owned a bicycle the one horse-power engine of which was fitted with two external flywheels on opposite sides of the engine, as he suggests.

This machine was fitted with tube ignition and was built by Werner Frères. A. C. E. WHITTARD.

A Suggested Oil Gauge.

[3257.]—I wish to call the attention of your readers to a means whereby the correct amount of oil in the crankcase may be assured when the engine is not running and the machine is level. It is well known that if a bottle be filled with water and placed upside down with the neck in water no water will run out of the bottle. If air be allowed to get in it will run out until the passage of air is stopped. The correct amount of oil for the running of the engine should have a definite level in the crankcase. Let a tube and a stop cock be connected from the oil reservoir to this level (which level can be found by experiment). When the cock is opened the oil will flow till it reaches the level of the end of the tube (which is adjusted to the correct level), when no more oil will flow because no air can get to the reservoir to replace the oil. The cock must be closed after, because when the engine is running, the oil being tossed about, would not cover the end of the tube. This arrangement would be very handy when starting for the day, or at moments when the engine is not running. F. S. AVERY.

A Satisfied Purchaser.

[3258.]—You inserted in January a letter of mine, and your much appreciated reply thereto in reference to the advisability of my exchanging my 1906 Rex motor cycle for the 1908 Rex two-speed gear, ball-bearing engine, twin-cylinder machine fitted with the twin back tyres. I write now to thank you very much for your advice *re* the exchange contained in this letter.

I may say, firstly, that my early Rex twin served me very well, although, of course, there were many improvements and refinements that were desired.

I have now used my new Rex with and without Montgomery sidecar, for about ten weeks and am delighted. I find the engine very powerful and flexible, the change speed gear is all that by results can be desired, and by its use I can now travel from slow walking pace to fully forty miles per hour. It is, to myself, an inestimable boon that now, in the event of a traffic check on a hill, I am relieved of coming to a quick choice of either taking one's chance, or dismounting with the latter's attendant muscular efforts in restarting, especially with sidecar. My mount will start firing evenly at the first turn of the handle, and also will, as you stated, glide off on almost any gradient.

I have never had the slightest symptom as yet of any skid, although I have been over most treacherous stretches. The machine is most comfortable, and the brakes are really efficient.

I am fitting handle-bar control, and this, together with the fitment of an easily removable less open silencer for use with sidecar, is the only improvement. I think the latter is desirable for a really useful passenger taking motor cycle. I have no financial interest in the Rex Co.

ERNEST P. BLOIS.

Transmission for Passenger Machines.

[3259.]—I am using a sidecar with my 5½ h.p. twin-cylinder motor cycle, and after trying all kinds of well-known belts with unsatisfactory results, I have now made a combination of a chain and belt drive, having the advantages of both, and, I believe, none of their disadvantages. I have fitted a counter-shaft in the bottom bracket, carrying a chain wheel and pulley screwed together. I use a chain drive from the engine-shaft to the counter-shaft, and a belt drive from the counter-shaft to the driving wheel. The gear can be reduced to any desired extent from the engine-shaft to the counter-shaft, thereby allowing the use of a fairly large pulley. The reduced speed and large size of the pulley afford a splendid grip for the belt, and should reduce the wear and tear of the same very considerably. I have found the combination answer very well. It may perhaps interest some of your readers.

W. LOWEN.

Courtesy at the Shows.

[3260.]—The remarks of some of your contributors as to the treatment received at the hands of British manufacturers at the shows have been forcibly brought to mind during the last few weeks. For example, I wrote to one of your Lancashire advertisers *re* the boring of a cylinder, but received no reply. I afterwards sent the cylinder to one of the principal London advertisers of this class of work, under their promise to return the cylinder within five days, but three weeks elapsed before I got it back. Again, on the 19th ult., I sent to another London advertiser for such a simple thing as an inner tube 26in. by 2¼in., but I have not even yet received the tube, although it is now eight days since I sent them the order, and of course in both cases cash was sent in prepayment. One would have thought that those whose business it is to cater for motor cyclists would have sought rather to minimise than to add to the worries of the patrons of motor cycling, who experience quite enough trouble without such annoyances as I have indicated above. BRITON.

Does an Air-cooled Engine Overheat?

[3261.]—*Re* Mr. Walford's letter, my remark regarding smoke pouring out of the silencer was to show that oil can and does get to the piston rings. In fact, it gets past them; hence the smoke. Mr. Walford some time back stated that, owing to pressure on top of the piston, no oil could get at the piston rings. But when the machine is run down the hill with the exhaust valve lifted, owing to the pressure not existing the rings are lubricated, and on the second try the machine goes up. It is certainly wrong to have a smoking engine, but engines often do smoke badly on a hill, thus proving that oil can get to the rings.

In America large air-cooled engines are used. Very likely, but why the special bonnet and fan arrangement? The Americans seem to fear an overheated engine, and I do not blame them.

Finally, Mr. Walford is some time finding out what stops my engine on a hill when it is hot, and what makes it go up when it has cooled down. It is not lack of lubrication, as I have tried extra lubrication with very little better results. It is not due to the oil being unable to get at the piston rings, as I can start straight off from where I give out. What then is it, if it is not excessive heat of the engine?

A NECESSITY When on Tour.

The Autocar FOLDING MAP for Motorists

(In Strong Case).

When on tour the automobilist is often faced with the question or which road to take or the best way to reach a certain place. All such difficulties can be overcome by carrying "The Autocar" Folding Map in your kit. It occupies very little space, as when folded it measures only 7½in. × 9½in. All main roads are marked in red, and the distances between all important towns are given.

PRICE 8/10, Carriage Paid.

OBTAINABLE FROM

The Offices of "The Motor Cycle," 20 Tudor Street, London, E.C.

The Selection of Gear Ratio.

[3262.—As an interested reader of your very able journal, I have noticed the article in a recent issue on the choice of gear ratios. May I, without in any way decrying the excellent work of its author, say that I have used such curve diagrams for the past eighteen months for the purpose of determining the proportions and values of change-speed gears for motor cycles, tricars, and sidecars, and subsequently for motor cars also? An illustrated article upon their application to the latter vehicles was published under my name in the *Mechanical World* of February 14th last, although it was written so far back as last July.

I think I may perhaps claim to have been the first to submit to your notice such curves for motor cycles in January, 1907, and shortly after I lectured upon them before the Engineering Society of University College, Southampton.

A. H. BURNAND, A.M.I.Mech.E.

Gudgeon Pin Accidents.

[3263.]—I notice in a recent issue of *The Motor Cycle* that "Ixion" waxes wroth because someone has had the temerity to doubt the statement *re* gudgeon screw in his article on page 216. I expect the two riders he names have been pulling his leg, and are now quietly laughing at him. The story seems about a match for "What he found in the Carburetter," page 258, and if "Ixion" would only remember that your paper is read by more than mere schoolboys, he would not incorporate such terminological inexactitudes in his "Comments." The whole story reminds me of one told by another of your contributors, Rev. B. H. Davies, who once had his inlet valve stuck sideways in the top of his piston like a penny in a cheese.

I do not think "Ixion's" incredulous correspondent made any inexcusable blunder, because, as the story was printed, it left no alternative but to think that the screw came through the cylinder above the piston at the bottom of the stroke. He said, "The engine continued to run with increased power owing to the freer exhaust," and later, "and creating no small barking." It is the first time that I have seen the air released from crankcase described as exhaust, and the first time I have heard of it making a barking noise.

If I were "Ixion" I should want to see the cylinder in question before he writes out a story like the above again. Also I should think that motor makers have more sense than to make a piston which at the bottom of its stroke was so far from the end of the cylinder joint. It would mean a great waste of iron.

J. HAYTON.

Consumption Trial Formulæ.

[3264.]—It will at once be obvious to everyone reading Mr. Wheater's letter No. 3223 that he has not correctly read the brief details of the paper read before the members of the York County Motor Cycle Club as reported in *The Motor Cycle* of March 11th.

I have heard it said that figures may be made to prove anything, and I believe this to be true to a certain extent, especially if they are manipulated by a person professing a good knowledge of mathematics.

The formula I suggested was, weight of rider in pounds + cubical capacity in centimetres ÷ petrol consumption in ounces = figure of merit. The highest figure of merit the best performance. This will show very different results compared with the examples quoted by your correspondent.

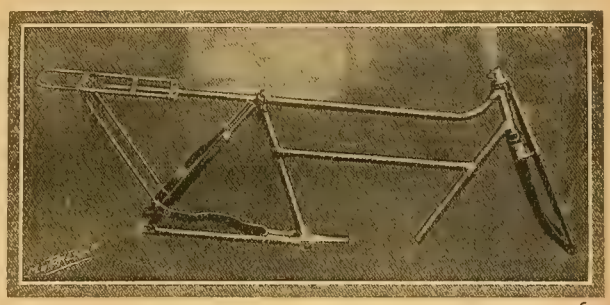
If we keep to Mr. Wheater's examples, retaining his figures for weight of rider and petrol only, and substituting cubical capacity in centimetres in place of nominal horse-power, we obtain 670 for 5 h.p. (= 5 h.p. twin Vindec) and 376 for 2½ h.p. (= 2½ h.p. Wolf), and working out this formula correctly, we obtain the following varying figures of merit, 51, 67, 77, 43, whereas the examples given by your contributor each showed the figure of merit to be 50. The idea of the author was no doubt to prove that a 5 h.p. machine would be allowed twice the amount of petrol compared with the amount allowed a 2½ h.p. machine, and a rider weighing only half the weight of another competitor would be expected to travel twice the distance on the same amount of petrol. This is far from being true, and is the very factor which the suggested formula counteracts.

Mr. J. R. Kelly's views of a consumption trial formula appeared in *The Motor Cycle* of June 12th, 1907, and coincide with the method already adopted by many clubs, viz., petrol allowance for weight of rider and machine, but in addition he suggested penalising a rider for every second late in arriving after minimum time in completing a given distance. It was this penalising clause which came under my criticism, and which, in my opinion, is introducing into the formula an element or factor which might possibly materially affect the result, apart from the petrol consumed.

H. H. CHARGE.

Luggage Carriers.

[3265.]—Regarding the luggage carrier described by Mr. Richardson Billings [letter No. 3232] in *The Motor Cycle* of April 8th, this is similar to our registered carrier, Reg. No.



516,308, which was shown at the Stanley Show fitted to one of our Dot motor cycles Ours is made with telescopic stays and long seat-pillar. This allows any position of saddle. Registered number of frame 516,309.

H. REED AND CO.

The Future of Motor Cycling.

[3266.]—In *The Motor Cycle* of March 11th, page 193, you gave an illustration of my 9 h.p. spring frame Bat machine fitted with the Premier two-speed gear and internal expanding Roc clutch, and, judging from the correspondence I have received about the same, it is just the machine that many of your readers are looking for and only waiting to see if the combination is a success, so if you would kindly insert this letter it would save a lot of trouble and writing.

While there are many that are just coming into the ranks of motor cyclists and require a lightweight machine, there are many like myself that remember the 2 h.p. in the old days and the desire each year for more power, and I am pleased to say at last we have got a motor cycle that will climb any hill in this island of ours, while for speed I do not think there is anything to touch it on the road.

The two-speed gear is a grand invention; to be able to start the engine with the handle and stand over the machine, the saddle being built low down, and just press the low gear pedal and glide away, is very fascinating. Many of us know something of what it is to have to push and run alongside a twin-cylinder machine, weight about 200 lbs., and engine cold and stiff, then, after a mile or so of this, to find accumulator run down, which was fully charged the night before.

But with the magneto all these troubles are done away with, and as the starting handle fits on the live axle the starting is geared up and engine starts first turn.

When the machine is under way all you have to do is to press the high gear pedal, when the whole of the gear runs solid, and to change down again press the low gear pedal, which automatically releases the high and puts the low gear in; no change-speed levers, two pedals to push, that is all; no jar, no shock, no noise; the whole gear works very smoothly, and there is nothing to get out of order.

I was told by an expert that there was no two-speed gear on the market that would stand the pull of the 9 h.p. J.A.P. engine, but this gear is well up to its work, and would stand a larger engine if necessary.

For any who require speed, comfort, or a machine for sidecar work, this is just the machine. What with the magneto, automatic lubricator, spring frame, two-speed gear and free engine, we have got very near the ideal.

The engine is a fine piece of workmanship, and is almost silent.

I need hardly say I have no interest in the makers of the machine or the gear. LUTHER L. FARRINGTON.

Unattached Riders.

[3267.]—Mr. S. Herbert Fry exactly voices the case of myself and a large circle of motoring friends. We have no time for club runs and other fixtures, being mostly in businesses of various sorts. We would all like to join the A.C.U. for mutual help and protection, to forward the pastime, and to give weight to agitations for road improvement and other forward movements, but so far have been unable to join any body at anything like a reasonable expense.

So I and others are glad to see the C.T.C. stirring in the matter, though should much rather the A.C.U. had accepted Mr. Hall's proposal. CHAS. D. FITZGERALD.

A Dissatisfied Owner of a Twin.

[3268.]—As a possessor of a 5 h.p. twin motor cycle, may I be allowed to state a few facts concerning the same?

Having ridden since last May slightly under 4,000 miles, I was compelled through bad knocking to dismantle the whole engine, and to my astonishment found everything in a wretched state of wear, although it had always been well lubricated with an oil recommended by the makers.

The pistons and connecting rods had a considerable amount of play both vertically and horizontally; the timing wheels and exhaust cam were also very much worn, to say nothing of the bearings upon which they run.

May I ask if it is usual for a 5 h.p. engine to wear in this way in such a short space of time? If so, I can fully understand the popularity of the 3½ h.p. single-cylinder machine.

I should be glad to hear if any of your readers have had a similar experience with 5 h.p. twins. DISSATISFIED.

Motor Cycle Taxation.

[3269.]—I have read several interesting letters in your paper *re* motor cycle taxation at different times, but up to the present there is one phase of the subject which so far as I can see has not been touched upon, and as I feel it concerns a large and growing proportion of motor cyclists, I have overcome my usual reluctance to rush into print.

I allude to riders who can only afford to buy second-hand machines, and who by doing most repairs themselves are able to bring running and maintenance expenses down to a very low figure compared with their less penurious comrades in sport.

The £1 a year proposed by the Royal Commission is, I contend, an unfairly placed burden on such a man as I cite above, and is out of all proportion to the proposed tax on a large car.

There are motor bicycles (and reliable ones, too) on the second-hand market to-day at about £15—perhaps a little under-powered when compared with the last word in, say, 3½ h.p. machines, but still good value for the money. Now, I ask, is it fair to ask such a man owning such a motor cycle to pay a tax just amounting to under seven per cent. of his original outlay, when a person owning a large car which may cost anything from £800 upwards only pays the £8 8s. suggested by the Commission, or slightly over one per cent. on the outlay?

I contend that in the face of the above figures there are three courses open to the Chancellor of the Exchequer. He should either—

(*a*) Allow the motor cycle tax to remain at £1, and raise the car tax to somewhere round £50; or

(*b*) He should allow the car tax to remain at £8 8s., and reduce the cycle tax to somewhere round 2s. 6d. or 3s.; or

(*c*) He should strike a happier and fairer medium having regard to original outlay, as well as weight.

Some of your readers may think I have under-estimated the cost of a second-hand motor cycle, but I know three motor cycles in this district that cost their owners £14, £16, and £17 respectively, ready for the road in every way; two are 2¾ h.p. and one a 3½ h.p. magneto, and all three have thousands of miles of wear left in them.

The figures *re* taxation I take from Mr. Jeffreys's letter [No. 3180], page 223 of your paper for March 18th, 1908.

My assumption that a man's ability to pay a tax can be judged by the amount of money he is able to lay out on the article taxed is, I think, a fair one. Theoretically, I consider an *ad valorem* tax the ideal one, but it would so easily lend itself to misuse and fraud that I fear it would hardly be practicable unless some official scale of depreciation could be arrived at, and even this might have bad effects on and tend to in a measure govern the market in an unfair manner. However, this is a wide subject, and I fear I am taking up more than my fair share of the road, so conclude.

H. BANNISTER.

Two-speed Gears and Free Engine Clutches.

[3270.]—If we may trespass on your space, we should like to add a word to the discussion referred to in letter No. 3203, by "F. M."

We support the contention that an air-cooled engine fitted with a suitable gear can be easily handled in traffic without any fear of overheating. The whole point is to have the gear so adjustable to every condition that the engine is always running without effort and firing regularly. Regular firing is most essential to prevent overheating. It will readily be seen that if the gear is not adaptable, the engine has to be switched on and off, with the result that after switching off a larger charge of gas is required to make up for the power lost through the explosion or explosions which the engine has missed, or, in other words, to give a bigger kick to the engine to enable it to drive through an unsuitable gear. This is the true source of overheating and waste.

We find with our Gradua gear that in traffic we can gear down so exactly to the required conditions that we can get the engine to fire regularly with a minimum of gas and without overheating. With this gear, which is infinitely variable, giving any ratio from free engine to the maximum obtainable (three and a half to one, as fitted to a 3½ h.p.), we will undertake to demonstrate for an hour in any traffic, and prove that what we say is correct. We do not imply that one hour is all that can be done, but it should be sufficient to prove our statement.

It is the old argument over again—overheating is due to overloading, and overloading, in nine cases out of ten, is due to unsuitable gearing. ZENITH MOTORS, LTD.

The Balancing and Overheating Questions.

[3271.]—There seems to be a good deal of unnecessary ink wasted in some of the letters to the editor in which the writers refer their fellow motorists to the laws of dear Mr. Boyle and Mr. Charles, and also the concisely expressed laws of dear Mr. Newton.

Possibly the writers who have been instructed to refer to Boyle's, Charles's, or Newton's laws wrote more with the desire of provoking a discussion having some bearing on motor cycling than with the idea of receiving free "correspondence lessons" in physics.

I noticed last week that a designer of one of the leading motor firms is told to look up Newton's third law of motion (which he probably knows).

In answer to Mr. R. A. Parry, might I suggest to him that Newton's third law of motion does not enter into the argument at all (at any rate, not in the way in which he suggests); also, I quite agree with 3188 when he says that the higher the compression the greater the vibration; and I would further suggest that Mr. Parry take a motor cycle along a level piece of road, and (whilst thinking of Newton's third law of motion) push it over the compression, and notice if he can do this without a jerk; and that he notice that the greater the compression the greater the jerk, and *vice versâ*—which is what 3188 refers to—and I think nine out of ten motorists will agree with him without even considering Newton's laws.

Possibly Mr. Parry is thinking only of vertical vibration, but if so, why is he considerably surprised at the designer at one of the leading motor firms [No. 3188]?

I will refer him also to letter 3226, with which, being the happy rider of a Triumph, I quite agree.

Hoping in future to see less elementary physics as taught in some of your correspondents' letters,

RICHARD WATKINS.

EXPERIENCES WANTED.

"Salopia" would like readers' experiences of the Unito motor cycle coupling. He adds: "It is stated that a 15s. license for the motor cycle covers the connected pedal cycle. Is it correct?" [No; it depends on Revenue officer. Some insist on £2 2s., others treat attachment as a trailer, and are satisfied with a further license of 15s.—ED.]

A Good Cycle Tyre

was badly wanted.
We have it at last

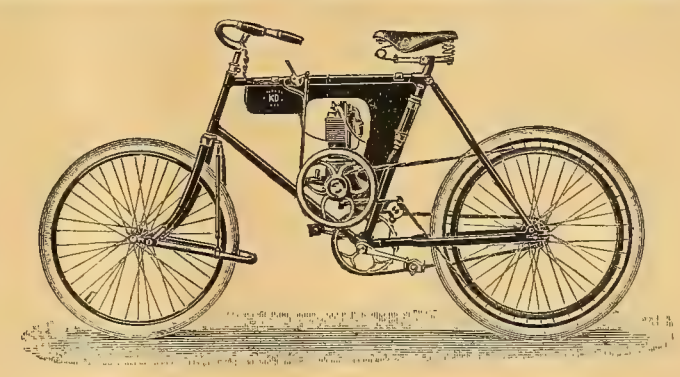
"K.D."

FEATHERWEIGHT MOTOR CYCLE FREE



1¾ H.P. Weight **69 lbs.**

With a view to advertising our K.D. Light Weight Motor Cycle, we are offering to every reader of "The Motor Cycle" an opportunity of acquiring one of these popular and efficient 23 guinea machines absolutely gratis.

This cycle was exhibited at the Stanley Show and created great interest owing to its efficient construction and power for weight.

All you have to do is send for one of our mouth sirens, price **2/6**, and upon receipt of your P.O. we will forward one of our latest mouth sirens (guaranteed the best road clearer on the market—"The siren you sent me is simply grand, clears the road A1," writes Mr. W. Nott, of Bristol), which is in itself full value for the money, together with a descriptive leaflet of the K.D., and an entry form for you to fill up stating the reason why you consider you should be awarded a K.D. free. These forms will be forwarded to Mr. B. H. Davies, the popular writer for "The Motor Cycle," with only a number as a means of identification, and he will judge which is the best reason and award the K.D. Motor Cycle to the winner. The bicycle can be seen at our showrooms, where all communications are to be addressed:

64a, POLAND ST., and 13a, BROAD ST., W.

Competition closes May 15th, and the Winning "reason" will be published in "The Motor Cycle," on May 27th.

LEO. RIPAULT & CO.,

Sole agents for the K.D. featherweight.

In answering either of these advertisements it is desirable that you mention "The Motor Cycle."

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—1d. per word, minimum 1s. Name and address must be counted In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisments in this section should be accompanied with remittance and be addressed to the offices of "The Motor Cycle." Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, on the Friday morning, or if sent to London, by the Thursday afternoon previous to the date of publication.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at *The Motor Cycle* Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed "No. 000, c/o *The Motor Cycle*, Coventry," or if "London" is added to the address, then to the number given, c/o *The Motor Cycle*, 20, Tudor St., E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with *The Motor Cycle*, both parties are advised of this receipt, and upon intimation of the arrival and acceptance of the goods, the money is forwarded less a charge of 1s. for registration. The time allowed for a decision after receipt of the goods is three days. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR BICYCLES FOR SALE.

HALIFAX.—Holds the finest and largest stock of second-hand cycles in the world. 300 to select from. All machines are despatched in running order, with charged and guaranteed accumulators.

HALIFAX.—45s. deposit and six monthly payments of 29s. 6d. secures 2¾ h.p. Excelsior, 2¾ h.p. Humber, 3 h.p. Hobart, 3 h.p. Lloyds, 2¾ h.p. Minerva, 3 h.p. Automotor, 3½ h.p. Rex, 2½ h.p. Aurora, 2¾ h.p. Stevens, 3 h.p. M.M.C.; all guaranteed running order

HALIFAX.—5-6 h.p. Alcyon, twin, spring forks, N.S.U., two-speed gear, light and low; £23 10s.

HALIFAX.—4 h.p. Antoine, 26 wheels, low frame, trembler, girder forks, very fine mount; £16 10s.

HALIFAX.—3½ h.p. light low Rex, spring forks, 26in. wheels, Longuemare; £12 17s. 6d.; snap this.

HALIFAX.—2 h.p. Humber, spray, trembler, chain drive, splendid climber; cheap, £9 10s.

HALIFAX.—Fine 3½ h.p. Rex, spray, adjustable pulley, very smart and good; £11 10s., tyres excellent.

HALIFAX.—3 h.p. Rover, 26 by 2¼ Palmers, front rim and Bowden rear brakes, Brooks B100; £13 10s.

HALIFAX Motor Exchange.—Cash, exchange, or extended payments. High-grade machines purchased for spot cash.—16, Westgate, Halifax. Telephone, 766. Telegrams, Perfection.

are invited to ask for particulars of the WARWICK (Car-style) motor cycle, 4 h.p. It is fitted with PREMIER TWO-SPEED GEAR and ROC (Licensed) INTERNAL EXPANDING CLUTCH, Magneto Ignition. Seat, 31in. from ground, no pedals. STARTS LIKE A CAR. It embodies the results of close study and intimate experience of motor cycles and the needs of motor cyclists since motor cycling began.

Our pamphlet **"The Evolution of the Motor Cycle—culminating in the WARWICK"** contains much interesting and instructive matter. We will send it post free with our booklet on "The choice of a motor cycle, etc., on application."

We are SOLE MANUFACTURERS of the WARWICK, and hold in stock the following makes also:

TRIUMPH.	ROC.
BAT.	F.N.
N.S.U.	MINERVA.
VINDEC.	BROWN.
MOTOSACOCHE.	REX, etc.

You cannot obtain any of the above more cheaply than from this Agency. Moreover we take your second-hand machine in part payment, allowing *at least* as good a price as you would obtain by selling it privately, and you are saved all the trouble and annoyance associated with private sales. Below is a list of **Second-hand machines in stock,** all those over £12 being covered by the Premier **Certificate of fitness:**

N.S.U., 1907, 3½ h.p. Roc clutch and gear	£35 0
ROC, 5 h.p. magneto, Roc clutch	32 0
TRIUMPH, 1907, 3½ h.p. magneto	35 0
N.S.U., 1907, 3½ h.p. magneto, free engine	24 0
N.S.U., 1907, 3½ h.p. magneto, Roc two-speed	30 0
N.S.U., 1907, 3 h.p.	15 0
VINDEC SPECIAL, 1907, 5 h.p. Truffault, and two-speed	35 0
VINDEC SPECIAL, 1906, 5 h.p. Truffault	27 0
NORTON, 1907, 5 h.p. spring forks, magneto	30 0
SINGER, 3¼ h.p. Magneto, new condition	22 0
KERRY, 1906, 3½ h.p.	8 0
ARIEL, 1906, 3½ h.p.	9 10
REX, 1907, 5 h.p. spring forks	17 10
ROC, 1906, 5 h.p. magneto	30 0
EXCELSIOR, 2¾ h.p.	8 0
BRADBURY, 3½ h.p.	8 0
MINERVA, 2 h.p., perfect condition for the road	9 0
QUADRANT, 3 h.p.	9 10
WHITLEY, 3½ h.p.	10 0
REX Tricar, faultless, running splendidly	23 0
DE DION Tricycle, perfect running order tyres very sound	3 10

AGENTS looking for easy-selling lines should write for particulars and discounts of the following:

MOTOR BICYCLES FOR SALE

HALIFAX Motor Exchange.—Careful consideration of the following will be to your advantage: Why live in this miserable world and potter along on that thumping, perspiring, overheating, and overworked single-cylinder, when you can get a fine twin Rex (a maker's triumph, and the result of many years' experience), with long low frame, long bars, spring forks, and good tyres, in fact, a gentleman amongst paupers in most company, for the modest sum of £22, or we allow you a liberal sum for your old mount in part payment. Note the liberal terms of exchange; £16 for 1906 Rex, £13 for 1905 Rex, £11 10s. for 1904 Rex, or £10 10s. for 1903 Rex.—Halifax.

HALIFAX.—2¾ h.p. Minerva, mechanical valves, 26 wheels, 2¼ tyres, perfect order and condition; £14 10s.

HALIFAX.—3½ h.p. Minerva, spray, girder forks, 26 by 2¼ Clincher A Won, begging at £16 10s.

HALIFAX.—Fine 3½ h.p. Rex, long bars, low saddle, good climber; £11 10s., bargain.

HALIFAX.—Genuine Twin Rex, £22, guaranteed, spring forks, low built, goes like a flash; £16 given for 1906 Rex, £13 for 1905 Rex, £11 10s. for 1904 Rex, or £10 10s. for 1903 Rex in part payment.

HALIFAX.—3½ h.p. Bat, spring frame, long bars, low saddle, 26 by 2¼ Dunlops, Watawata; £20.

HALIFAX.—3 h.p. Bat, two speeds, very smart, good machine, nearly new; bargain, £20.

HALIFAX.—3½ h.p. Phelon and Moore, two speeds, special low frame, spring forks, new non-skid; £30.

HALIFAX.—3½ h.p. Clarendon, vertical engine, footboards, ball bearings to engineshaft, 100 miles non-stop; £13 10s.

HALIFAX.—3½ h.p. Rex, spring forks, vertical engine, spray, special finish; £14 10s.

HALIFAX.—Brand new 2¾ h.p. Bat, Peugeot engine, 26 wheels, unridden, and perfect; £25.

HALIFAX.—3½ h.p. 1907 Rex, magneto, Crypto two-speed gear and Montgomery flexible sidecar; complete, £28 15s.; without sidecar, £24.

HALIFAX.—1906 3½ h.p. Rex, specially good condition, 26 by 2¼ Clinchers; £16 5s.

HALIFAX.—5½ h.p. 1907 Rex de Luxe, twin tyre, Roc clutch, magneto, spring forks; £27 10s.; bargain.

HALIFAX.—3½ h.p. Simms, vertical engine, magneto ignition, easy starter, reliable; £17 10s.

HALIFAX.—Fine twin Rex, Greenwood's Leeds-London record holder, registered, guaranteed; £22 10s.

HALIFAX.—Special 7 h.p. Peugeot, twin-cylinder, nearly new, a regular flier; £30.

HALIFAX.—3 h.p. Givaudan, late model, spray, almost new, perfect every way; £15.

HALIFAX.—3½ h.p. 1906 Rex, spring forks, low frame, foot brake, aluminium finish; £15.

HALIFAX.—Kerry, 3½ h.p., vertical engine, spray, very fine condition; £16 10s., perfect order.

HALIFAX.—3½ h.p. Clarendon, vertical engine, footboards, ball bearings to engineshaft, 100 miles non-stop; £13 10s.

HALIFAX.—3 h.p. Hobart, vertical, spray carburetter, trembler coil, splendid condition; £12 10s.

HALIFAX Motor Exchange.—Extended payments, exchanges; high-class machines purchased for spot cash.—16, Westgate, Halifax. Telephone, 766. Telegrams, Perfection.

MOTOR BICYCLES FOR SALE.

MAUDE'S.—4½ h.p. twin Minerva, 2½in. tyres, standard; £23.

MAUDE'S.—Rex, 1907 model, blue finish, 5 h.p., splendid condition; £21.

MAUDE'S.—1907 Triumph, practically new, and not been ridden 500 miles, splendid condition; £35.

MAUDE'S.—Rex de Luxe, Roc free engine, in new condition throughout; £27.

MAUDE'S.—Rex, 6 h.p., 2½in. Model de Course, Continentals, cantilever seat; £21.

MAUDE'S.—7-8 h.p. Minerva, 1908 model, very little used; £35 10s.

MAUDE'S.—Rex, 3⅜ h.p., spring forks, spray, trembler, 1906 model, a beauty; £14.

MAUDE'S.—Rex, 1905, low built, spray, 26in. wheels; £12.

MAUDE'S.—1907 3½ h.p. Rex, magneto, in perfect condition; £19 19s.

MAUDE'S.—Rex, 1907 model, just been thoroughly overhauled, and guaranteed like new; £18.

MAUDE'S.—Rex, 1904, Phœnix two-speed gear, suit sidecar; £11.

MAUDE'S.—Rex, 3½ h.p., in very good condition; £9.

MAUDE'S.—Rex frame, Automotor engine, front wheel minus tyre, wants slight additions and alterations; sacrifice £4 15s. lowest; a bargain for anyone who can tinker a machine up.

MAUDE'S.—2¾ h.p. Minerva, new rear tyre, vertical, thoroughly overhauled and enamelled; £12.

MAUDE'S.—2¾ h.p. F.N., 26in. wheels, Palmer tyres; £10.

MAUDE'S.—Clarendon, 3 h.p., vertical engine, beautifully enamelled in green; £10.

MAUDE'S.—2 h.p. Humber, very good condition, plated tanks.

MAUDE'S.—Fafnir, 3 h.p., 26in. wheels, long handle-bars, low built; £12.

MAUDE'S.—Centaur, 3½ h.p., vertical, B100 saddle, low built, free engine, 26in. wheels; £15.

MAUDE'S.—3½ h.p. Excelsior, practically new tyres; £12.

MAUDE'S.—Minerva, 2½ h.p., spray carburetter, very good tyres; £10.

MAUDE'S. — Whitley, 3 h.p., spray, trembler; £9.

MAUDE'S.—Ariel, 3 h.p., 26in. wheels, vertical engine, M.O.V., splendid puller; £14.

MAUDE'S.—Jap, 2¾ h.p. engine, like new, £8; Cunard, 3½ h.p., £10.

MAUDE'S. — 3 h.p. Quadrant, spray, good tyres; £10.

MAUDE'S.—Fafnir, 2½ h.p., 26in. wheels, spray carburetter; £10.

MAUDE'S. — Ariel lightweight, 26in. wheels, 2½ h.p.; £10.

MAUDE'S.—Bayliss, 3½ h.p., £10; splendid puller.

MAUDE'S.—Noble, 3 h.p., spray, 26in. wheels, low built, perfect order; £10.

MAUDE'S.—De Dion, vertical, 2¾ h.p., long handle-bars, spray carburetter; £10.

MAUDE'S.—The machines listed below are ideal lightweights, and can be recommended for solo work.

MAUDE'S.—1½ h.p. Garrard, new front tyre, spray carburetter, coil and accumulator ignition; £4 10s.

MAUDE'S.—2 h.p. Ormonde, belt drive, spray carburetter, very good puller; £6.

MAUDE'S. — 2½ h.p. Ariel lightweight, 26in. wheels, low built, very good puller; £6.

MAUDE'S.—1¾ h.p. Minerva, spray, good tyres, guaranteed running order; your cycle and £4 4s.

MAUDE'S.—2 h.p. Zedel, newly painted engine, and everything perfect, weight 80 lbs., 26in. wheels, very low built; £12.

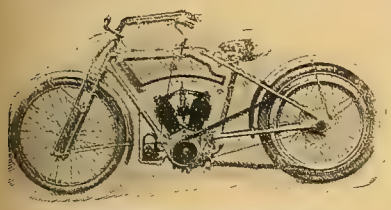
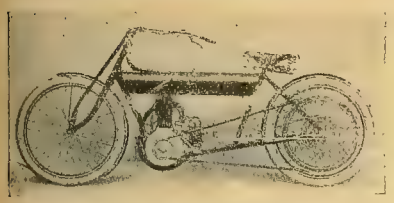
EASTER EXPERIENCES

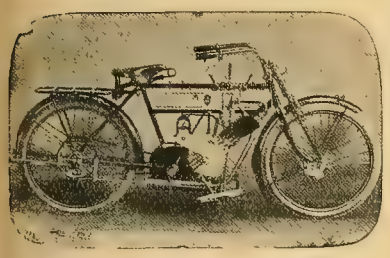
Were you quite satisfied with your machine, or do you require more power and comfort, or was the machine too cumbersome and the want of a lightweight felt. We can supply lightweights and high powered machines for solo or sidecar work, and relieve you of the trouble of disposing of your old machine by allowing you full value in exchange for a new one. The balance can be paid on our easy system on exceptionally low terms



REX models supplied fitted with Magneto Ignition from 25 guineas.



ROYAL ROC, Two Speed and Magneto, 48 guineas.



PHELON & MOORE, Two Speed, Magneto and Spring Forks, 50 guineas.

THE MOTO REVE lightweight, Two Cylinder Magneto, 37 guineas.

All the above can be supplied on our unique—Cash, Credit or Exchange system

CALL, 'PHONE, OR WRITE.

Unattached Riders.

WE trust we shall not be thought too insistent if we return once again to the subject of unattached riders. The correspondence we receive for insertion in our columns is quite sufficient excuse for a further ventilation of e subject, if any is required, and we particularly refer aders to a letter from the secretary of the Cyclists' ouring Club published this week as a proof that our ords are true, viz., that if the A.C.U. (the motor clists' organisation) will not cater for unattached lers, there are other bodies eager and willing to do so. The number of motor cycle members of clubs iliated to the A.C.U. or Motor Union both in London d the provinces is said not to exceed 3,000; thus ere are thousands of unattached riders awaiting velopments. These riders are, in the majority of ses, not desirous of joining a local club either for the rpose of engaging in competition or for sociability. ey therefore object to pay a subscription of half a inea per annum or more to a provincial club to cure the advantages of affiliation or to join the C.U. direct as a provincial private member to gain e same end, and, as our columns will show, several otor cyclists have written to *The Motor Cycle* in pport of these views.

Now the officials of London and provincial clubs ubtless consider that a scheme for the direct affiliaon or association of unattached riders to the A.C.U. uld prevent the expansion of their present membership. We do not agree with this view. The class rider who wants direct association at a moderate fee not the man to join a club organised for the purpose holding competitions, meets, etc. He does not want to compete in hill-climbs or to have anything to do with racing; he desires to tour at home and abroad, and receive the benefits of membership whilst touring, and obtain legal advice and assistance if he gets into trouble with the authorities. If any local club is afraid of losing members on account of direct association it merely proves that it has not sufficient attraction in itself to secure the sporting class of member.

The Association Scheme.

IN addition, the R.A.C. has a scheme of direct association wherein the local club benefits, *i.e.*, for every local motorist who associates himself with the R.A.C. direct the local club receives a portion of the subscription paid to the R.A.C. by the local associate. It is hardly necessary to add that the local club must be itself affiliated to the R.A.C. Could not a similar scheme be instituted by the A.C.U., and if not, why not? The fee we suggest for unattached riders to obtain certain advantages, such as touring facilities, legal advice, the right to exhibit the A.C.U. badge, etc., but not free registration for competitions, admission to papers and discussions at the Club, the use of the Club room, or the copy of *The Journal* or handbook, is five shillings.

The present subscription—half a guinea for country and a guinea for town members, with an entrance fee of 5s.—is not too high for the full list of advantages obtained, but it is time the A.C.U. recognised that there are other things to cater for besides competitions and racing, and that the coffers might easily be swelled with the unattached riders' subscriptions, instead of allowing their money to pass to the C.T.C. and M.U., and other bodies who appear ready to cater for them.

The question which arises in our mind is: Does the A.C.U. wish to be the representative motor cycle body or merely the governing body of the sport and pastime of motor cycling? If the latter is its only aspiration, the rejection of any scheme for unattached riders is the correct one, because the sport can be governed by a comparatively small body who merely require to meet, make rules, issue permits, and conduct the routine business of any similar organisation governing any other pastime. If, on the contrary, its ambitions soar higher, the policy of rejection is to assist one or two other bodies, such as the C.T.C. and M.U., neither of which has done anything of any great assistance to motor cyclists as a class, although the M.U. work on behalf of all classes of motorists must have done a good deal towards ameliorating the motor cyclist's lot, particularly in the way of preventing pernicious speed limits.

Will anyone who considers our arguments bad explain how the C.T.C. has been enabled on a 5s., and for a time 2s. 6d., subscription to pile up a big reserve fund? There are now far more motor cyclists in the kingdom than there were cyclists when the C.T.C. first saw the light.

The very existence of the A.C.U. depends upon funds. At the present time it has a grant from the R.A.C., but there is no reason why it should continue to receive a grant if it can make its own department pay. Neither is there any necessity for it to be absolutely independent of the R.A.C., although paying its own way, and the scheme is not advocated with that idea, but more to band motor cyclists together and keep them from becoming members of three or four different organisations, all with different aims and views which must clash eventually.

The executive of the A.C.U. might be led to think that any scheme for unattached riders would upset the affiliation scheme, but there is no reason why it should do so if the unattached rider is given to understand by documents or otherwise that he is not having the same advantages as an affiliated member of a provincial club, and the fact that he is not a member of a provincial club causes him to pay slightly more for the advantages he receives from the A.C.U.

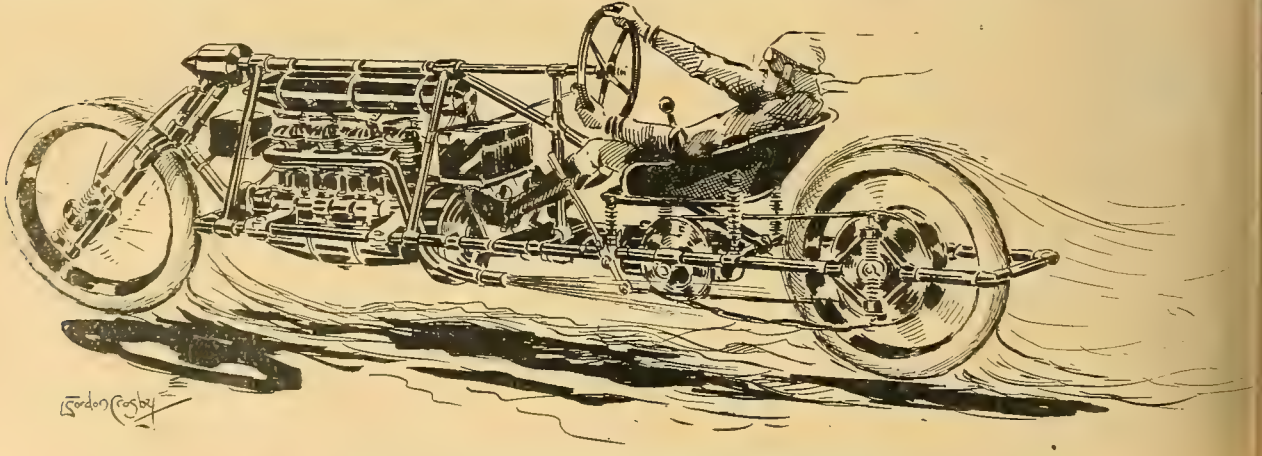
Finally, the unattached rider must be catered for, and why the A.C.U. cannot cater for him it is difficult to say, but it would be at least interesting to hear the exact reason why the executive are averse to affiliating unattached riders at a moderate fee.

Handicapping at Brooklands.

ENCOURAGED by the large number of entries received for the first open motor cycle race at Brooklands, the B.A.R.C. has decided to hold a motor cycle handicap plate of twenty-five sovereigns at the forthcoming meeting on May 9th. The conditions are not yet issued, but we understand that the engine size limit has been increased from 80 mm. by 98 mm. for twin-cylinders to 85 mm. by 95 mm. each cylinder.

With regard to the handicap, we should like to offer a suggestion which was recently made in our pages that in order to encourage slower machines the handicap should be framed upon the times made in a previous scratch race. The idea was first suggested in *The Autocar*, and was tried at Brooklands on April 4th, and resulted in some very close finishes. Owing to the length of the race (twenty-two miles), the proceedings were somewhat tedious in running off the scratch race, but in the case of the motor cycle handicap, if confined to five and a half miles, there would not be the slightest difficulty. The handicap would be framed as follows: A scratch race would be run everyone starting off the same mark, and times would be taken for each competitor. To prevent "roping," if a competitor improved upon his scratch time by more than an experimentally predetermined number of seconds, his fastest time would not count, and his time would be counted from the speed accomplished in the scratch race. As an example of the handicap, if the scratch race A made the fastest time, and B was 10s. slower, B would receive 10s. start from A; but if A only made the same time as in the scratch race and B improved on his scratch time by $4\frac{3}{5}$s., he would have beaten A by $4\frac{3}{5}$s. This is allowing for a predetermined 5s. allowance between the times made in the two races.

We have received a copy of the 1908 catalogue of Adler motor cycles. The British representatives for these machines are A. Muller and Co., 184, West North Street, Aberdeen. Adler motor cycles are made in single and twin-cylinder patterns, and with or without forecar attachments. The firm also manufacture a two-speed gear and free engine called the Kupplex. This gear fits on the engine-shaft, and is of the ordinary epicyclic type, giving a reduction of 35%. A catalogue will be sent to any reader on application.



AFTER BROOKLANDS. A DREAM OF THE FUTURE.

The Cost of Motor Cycling.

AN ACTUAL EXPERIENCE.

BEING an interested reader of *The Motor Cycle*, and seeing from time to time questions appear from correspondents as to the cost and upkeep of a motor cycle, I thought that the attached list of mileage and cost would be useful and interesting. I have kept a detailed log for the year, in which every item has been entered. I do not claim anything remarkable, but simply send it as an absolute *bona-fide* account of one year's running by an amateur. To me the cost has come out considerably cheaper than I anticipated, for I have given the machine some very severe work. I have ridden in all weathers—rain, hail, snow, wind, and fog—and have never had a misfire on any occasion, except last July, when the fibre ring of magneto got worn a bit, and which I had put right on discovering the cause. I have owned five machines since October, 1904, therefore my experience should be of value.

Machine: 3½ h.p. 1907 Triumph.

MILEAGE AND EXPENSES FROM MARCH 25TH, 1907, TO MARCH 25TH, 1908.

Mileage:

March	225
April	1,366
May	565
June	1,014
July 1st to 12th	96
August (did not ride owing to absence abroad)	——
September (did not ride owing to absence abroad)	——
October (did not ride owing to absence abroad)	——
November 18th to 30th	106
December	770
January	307
February	723
March (up to 25th)	304
Total	5,376

Longest ride, 260 miles; time, 11h. 15m.; average, 23 miles per hour.

Fastest ride, 41 miles in 1h. 20m.; average, 30¾ miles per hour.

Severest test on machine, February 21st, 154 miles; February 22nd, 151 miles; total, 305 miles. During this particular ride the roads were awful, and on the latter day a terrific gale blew, accompanied with rain. There was also a large touring bag on rear carrier.

Expenses:

	£	s.	d.
Cost of repairs, cleaning, and storage	6	6	7
Additions and luxuries (not absolutely necessary)	5	3	3
Petrol, oil and carbide	5	9	6
Total	£16	19	4

Average cost per mile, all included = .76d., or ¾d.
Total consumption of petrol, 62 gallons.
Average distance per gallon, 87 miles.

TYRES.

Clincher cover on back wheel, March 25th to May 1st, 1,366 miles; Palmer cover on back wheel, May 1st to December 5th, 2,001 miles; Clincher cover on back wheel, retreaded December 5th to February 7th, 929 miles; average mileage for two tyres, 2,148. The covers still have more wear in them, but prevention is better than cure.

Number of new inner tubes (both back wheel), two. Front tyre untouched till fortnight ago. Total number of punctures for the year, seven. Four side-slips, and all harmless.

BELTS.

First belt, Shamrock Gloria, *945 miles; second belt, Shamrock Gloria, 2,000 miles; third belt, Shamrock Gloria, *929 miles; average mileage per belt, 1,178.

H. C. B.

*Short life owing to bad weather chiefly.

With reference to the article, "Chain *v.* Belt," in our issue of April 1st, the Hanover Rubber Co., 29-31, Old Street, E.C., ask us to point out that they make an extra large Shamrock-Gloria belt $1\frac{3}{16}$in. wide, which they specially recommend for high-powered motor bicycles, particularly when used with a sidecar. A suitable pulley for this belt turned to an angle of 36° can also be supplied by the same firm.

Lined up for the first heat of the Five Miles Handicap on Canning Town Track, April 17th, for 76 × 76 m.m. engines. Colver won in 5 min. 52⅘ secs.

Touring on a Twin.

By F. DUNCAN HINDLEY.

AFTER three years' service from my trusty 2¼ h.p. single-cylinder Kerry, the thirst for power came, and with it a 5-6 h.p. twin-cylinder Kerry motor bicycle. I immediately decided that a tour in Ireland would be the only way to thoroughly enjoy the new sensation, so after a trial run of fifty miles I mapped out my programme for a couple of weeks up to Holyhead and then to Wicklow before meeting a friend for a few days in the wild west of Co. Clare.

I started with full confidence, in perfect weather, and covered mile after mile with ease, and only an occasional touch of the air lever on the down grades, proving that high power with a medium gear (four and a half to one), right mixture, and ignition advanced gives the utmost flexibility, and good average running without frequent adjustments of the levers.

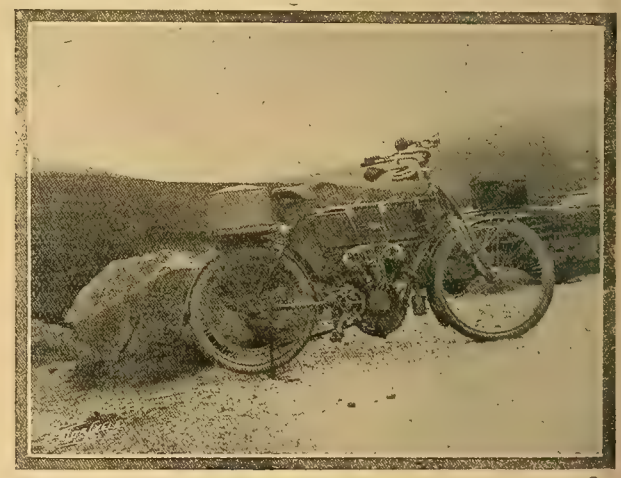
Through Watford, Boxmoor, Berkhamsted, Tring, Bicester, to Banbury without a pause or misfire—a sixty mile run as smooth and enjoyable as any mechanical transit yet invented. A rest for lunch, and then on through Stratford-on-Avon, up the slopes to Alcester, then up and down country till Wales is in sight, and that pretty border town of Bridgnorth stands up with the Severn running round its rocky foundations. The curved narrow hill up into the market square is taken at legal speed, and a first day's ride of 120 miles only acts as a *hors d'œuvres* for my touring appetite.

Muddy Roads on the Second Day.

In the morning I found rain and mud all around, but at 8.30 I was off in the direction of Shrewsbury, travelling well up the long hills, when suddenly I saw in front a torrent of water running across the road, and found a reservoir had burst and the water had cut a channel through the bank, and had swept down the hill for three hundred yards, tearing up the macadam and leaving huge ruts. As riding was impossible, the belt was taken off and threequarters of an hour spent in pushing those 2 cwts. up a quarter of a mile. The rain had left plenty of liquid mud, making riding less enjoyable. The afternoon was fine, but the Welsh roads were more treacherous, and the grey clay and smooth tyres did not agree. I, however, got safely into Pentre, where the comfortable Voelas Arms gave me welcome.

I was off again at 9 a.m. to catch the mail steamer at Holyhead. The roads had dried, and I let my machine out, but soon it began to misfire badly. Bettws-y-Coed is all downhill, so I got there easily, and called in at the Wellington Hotel Garage to trace the cause of delay, and on testing the accumulators found they were both run down, evidently having "shorted" the day before during the rain. I proposed to join them up in series, but was positively assured by a motor car owner that the combined current would not last me five miles, but as the road is all uphill to Capel Curig (a distance of nine miles) I decided to go on, and if I should fail I could free-wheel back; but I found increased power, and romped up the pass above Capel Curig, then down to Bangor, and across the fine stretch of Anglesey, with an hour to spare for the boat.

At Kingstown I left my machine at the garage to have the accumulators charged up during the night, and next day started to cross the Wicklow Mountains from Glendalough—that delightful and historic centre of ancient chivalry where in the seventh century St. Kevin founded seven churches. Up the wild slopes to the old lead mines and lovely moors, where the snipe and grouse attract only the keen sportsman, where white heather may be gathered, and where lakes lie



At the summit of Wicklow Gap.

undisturbed under the towering cliffs of Thonlagee, and Nature alone reigns supreme. The Gap is 1,570 feet high, and the grass-covered road is splendid to ride on. Although my destination was Athy, I rode to the Curragh Camp, and saw the Irish Yeomanry Sports, at which my stop-watch was commandeered for timing the races. Over the Curragh I let my engine "rip," and got to the town of Athy, named after an Irish chieftain Ae, who was killed there in the second century. The old castle is noted for its thick walls, and was built in 1500 to defend the bridge and River Barrow.

Touring under Difficulties.

Next day I rode over to Tullamore to meet my friend, who rode a light Ariel, and the difference in power and size of the two cycles looked absurd, but in actual practice they were more equal, and the light-

Touring on a Twin.—

weight proved a model of reliability. Within ten miles we had lost our way, and with that discovery came a double puncture in my back tyre and torrents of real Irish rain. Our destination was Galway, so we hurriedly patched up the tyre and set off, but the rain was too heavy to ride in, and we stopped at a cottage

On board the "Countess Cadogan" at Banagher.

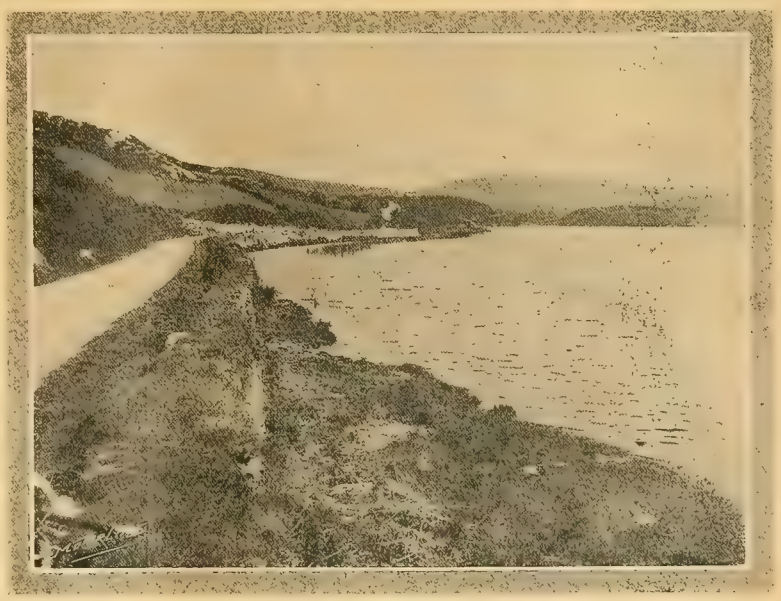
and entered with our machines. The mud-floored room contained a donkey, two pigs, a calf, and a dozen or more chickens, besides the owner, his wife, and three children, and all except the calf evinced the greatest delight in having the "real motors" in their "house." The roads were swamped, and as my tyre refused to stay up without inflation every two miles we decided to spend the night at Ferbane, and its only hotel made us as comfortable as it could. Ferbane has still the barracks with metal cage fitted with loopholes to fire up and down the main street, and the stocks are still left in the market place. The rain lasted all night, so we again changed our plans, and rode to Banagher, and boarded the little steamer which runs down the Shannon and through Lough Derg to Killaloe—thirty-five miles in all. As the day cleared the sail was delightful. At Portumna we passed under the 75oft. bridge into Lough Derg, passing a Dominican monastery ruin founded in the thirteenth century. I thought what use would be made of such glorious scenery and waterway if we had it here in England. Killaloe is the only town of importance on its banks, and, besides being one of the finest angling stations in Ireland, has one of the oldest cathedrals, which was founded in the sixth century by St. Dalna, and near the fine old bridge are found traces of Kinevra, the favourite palace of Brian Boru. We spent the evening in a coracle, fishing with varied success until 11.30 p.m.

A Change of Plans.

Owing to the uncertain weather, we again changed our plans, and, being free and independent of all organised modes of travel, we decided to try the bleak mountain roads of Co. Clare, with its many lakes, and get to Kilkee, the Atlantic popular resort of Dublin in summer. The roads were good, while the views were finer than anything seen in Wales, but five miles before Kilkee the roads became worse than paved ones could ever become, and we were glad to get into the town of whitewashed cottages, stretching for a mile round the pretty bay, with the "calm" Atlantic coming in waves which gave one the impression of supreme power and force. A plunge off the stone pier gave us an extra appetite, and after dinner we climbed among the giant rocks eaten away into huge caves by the sea. We were told that the chemist was the only man who might stock petrol, but a pint of benzole was the nearest thing he had, so we telephoned to Kilrush for a two-gallon tin to come by the celebrated West Clare Railway. We rode to the station, to find the can and a bill of 7s. 6d., "5s. being the minimum carriage." This we paid under protest, and set off to see the cliffs of Moher, which rise 300 feet sheer out of the Atlantic, and to see Spanish Point, where many of the crew of the Armada were buried. Coming back, we saw hundreds of fires, which light up the whole west coast of Ireland from every village and hill on the night of St. John the Baptist.

Quits with the Railway Co.

The following day we decided to take the train to Kilrush to escape that awful road, and were amused to find that the total amount of two first-class tickets and two motor cycles containing two and a half gallons of petrol was 1s. 6d. less than was charged for that one tin of petrol the day before, so we cried "Quits" with the toy railway, which is quite independent of time, control, or custom.



Lough Derg at Killaloe.

Touring on a Twin.—

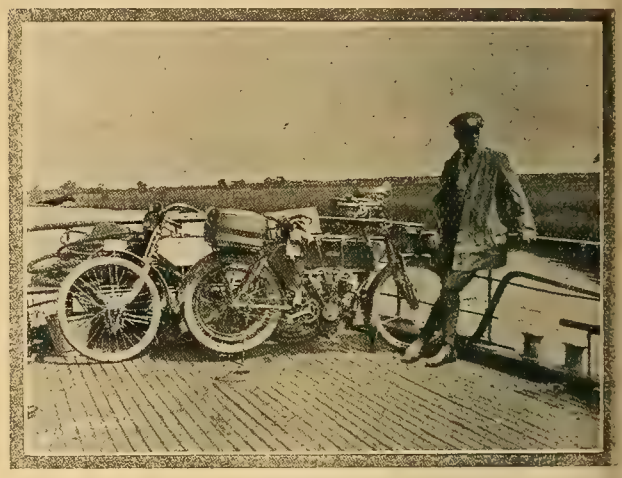
Ruins of Six Churches.

Kilrush is a small seaport at the mouth of the Shannon, and a visit to Scattery Island, one and a half miles to sea, should be made to examine the ruins of no less than six churches, which were founded in the sixth century by St. Senan, who also built the Round Tower, which is now one of the best examples, and stands 120 feet high. We followed the north coast of the Shannon up to Clare, with its ancient ruined castle, which was built by the O'Briens, and the abbey founded in 1195 by Donall O'Brien, King of Munster; then down to Limerick, one of the oldest and most historic towns in Ireland, the Royal city of Brian Boru, where the castle built by King John is one of the best Norman fortresses in existence. Then through the disused silver mines across the notorious cattle grazing moors of Roscommon and Roscrea to Borris in Ossory, which was the leading pass into Munster, and by the castle built in its defence by the Fitzpatrick; then across the Slieve Bloom Mountain into the Queen's County, flat and uninteresting, when suddenly I felt the machine pulling up. Taking the belt off, I was towed into Maryborough by the little Ariel. The gudgeon pin had come out and jammed the back cylinder, so we put up for the night while I had the engine overhauled. Maryborough, chief of Queen's County, was named after Queen Mary at the time that the names of King's and Queen's County were adopted in honour of Philip of Spain and his wife.

The Return Journey.

I here said goodbye to my companion, after a most interesting and delightful trip in one of the most historic and best touring centres a motor cyclist could wish to see. I rode down to Waterford by Kilkenny, another historic city, possessing the castle which was built in 1172 as a fortress by Strongbow, and is open free to the public. Waterford, like all other Irish towns, has a romance such as no other town can boast of. It was a Danish settlement in the ninth century, and now possesses one of the finest inland harbours. Crossing to Milford Haven, I toured for a couple of days through South Wales and the Midlands to London.

There is no doubt that a twin motor cycle requires more care and greater attention than a single-cylinder, but for ease in running and hill-climbing the latter cannot be compared to it, and as one who only uses the motor cycle for touring I should certainly not return to the single-cylinder again. Great care, however, must be given to the inlet valves and springs, and also to the contacts of the make and break, or misfires will result, and in trying to overcome these too strong a mixture will be given, which will quickly heat the engine. Lubricant should be given in small quantities, say a pumpful every ten miles, and the exhaust lever so fitted that the back valve is slightly raised before

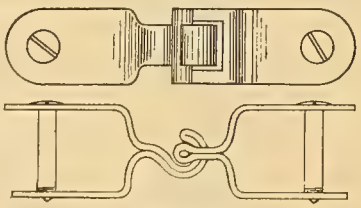


On the Shannon.

the front, enabling the front cylinder to be fired alone for traffic and at corners. I find the four-ply Watawata belt a great improvement on all others. Mine was not touched during the trip, and in rain and mud showed no sign of slip. The Peter Union band, which is fitted loose between the tube and cover, saves punctures, and prevents the tyre overheating or pulling out the valve through creeping. Although I am a motor car owner (8 h.p. Rover), I cannot get the same pleasure out of a run on the car as with the speedier cycle, which only requires the throttle more open to take it up a hill at the same pace as on the level, and which glides along in the best track and takes one with comfort through any district with rideable roads.

All petrol tanks should be fitted with an air valve to the filler cap. The usual hole provided allows petrol to slop over when tank is full, causes waste, and is dangerous if situated over a hot exhaust box.

A sample of the new Celerio detachable fastener for V belts has reached us from the South British Trading Co., Ltd., 13 and 15, Wilson Street, Finsbury, E.C. This detachable fastener is so simple, and yet so useful, it is strange that no one thought of the same idea before. Although it is readily unhooked when the belt is off the pulleys, it is next to impossible for the fastener to come apart when in use. Owners of machines fitted with adjustable pulleys should find this fastener particularly useful. It is made of spring steel, oil tempered.



The East London Rubber Co.'s latest motor catalogue is to hand. This is a most extensive and well arranged publication, which includes almost every accessory a motor cyclist requires. It also lists the Kerry 3 h.p. single-cylinder and the 5 h.p. twin-cylinder motor bicycles, both of which machines are built up with English frames and fittings. Another speciality with which this firm deals is the Kerry-Abingdon tricar—a light tricar fitted with a twin-cylinder air-cooled engine, chain drive and two-speed gear. In the event of any motor cyclist requiring accessories or fittings at short notice he may reckon that his agent will be able to procure them from the East London Rubber Co., Great Eastern Street, E.C., in the shortest possible time.

OCCASIONAL COMMENTS.

By "IXION."

Hooter Clips.

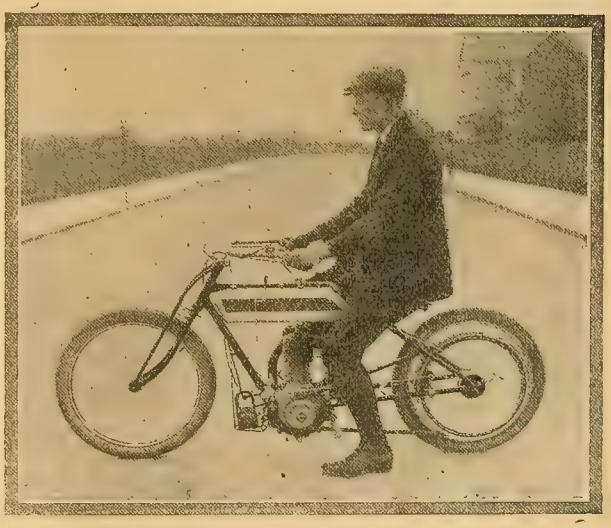
A note in a Yankee motor cycling journal has spired me to complain of the clips fitted to the erage hooter. I don't know whether I am more patient with the makers for selling such miserable ps for ten years or with myself for not loudly com-aining of them before. There are one or two horns the market fitted with special clips affording a firm ip of a ⅞in. or 1in. handle-bar, and with bolts that ither shift nor break; but I do not think there are ore than three of this type. The remainder first ift round like a badly girthed saddle, so that the rn gets underneath the steering bar. Then the oter slides gently down to the middle of the handle-rs, and jingles against the forks. The result is at for many years past I have always put a strip of ather and emery cloth under the clips, and in dition strapped the twist of the horn to the bar with short strap, and with these precautions the horn will metimes shift. In addition, if one attempts to ghten the bolts their heads are as likely as not to ist off, and the locknuts always get lost within a few ndred miles. Why does not every maker of a otor cycle provide a permanent attachment for the rn brazed to the handle-bar? Makers of horns uld soon provide a corresponding clip which could t shift. Some horns have another serious failing, wit, that if the bulb be unscrewed it is impossible to tract the reed without using a tool on it, and it often s so tightly that it cannot be got out without damage. suppose most riders know that when a horn is flicted with a fit of silence a speck of dirt on the etal tongue is almost invariably responsible; so the re is not to alter the set of the tongue, which usually ins the reed, but to remove the speck of dust with a p of paper or a fine wire, which should be slipped tween the tongue and reed without bending the rmer.

The Riley Gear Box.

A rider informs me that after two seasons' use of a h.p. Riley tricar, he experiences some difficulty in gaging his top gear. If he opens his gear box, he ll speedily behold the reason of this. Properly ndled, these gears will go in like grease, no matter w old the tricar may be. When the gear box is new, ere are no gears in the world easier to change, thanks the patented system, and there are plenty of three ar old tricars of this make on the road, the gears of iich change as easily and as silently as when they re new. Difficulty in changing results from slamming top gear hundreds of times over with the engine cing hard. This process in time burrs over the edges the dog clutch, and makes it first difficult, and ally impossible, to engage top gear at all. If my rrespondent has ever been a passenger on a decently iven car, he will have noticed that before declutch-g for a change up, the driver closes his throttle so that when the clutch is taken out the engine does t gain speed or race. The higher gear is then slipped the clutch gently but quickly re-engaged, and the rottle then promptly re-opened. This is the correct thod for the Riley gear box, too, although it will nd many a hundred miles of abuse, such as my correspondent has evidently given it. I should recommend him to open up his gear box at once, and inspect the third speed dog clutch. It may not be so badly burred that a new clutch is necessary, and very possibly a clever mechanic will reface it for him. There is an alternative solution—that wear has set up at the joints between the change speed lever and the drawbar passing horizontally through the top of the gear box, so that when his lever is in the third speed notch the third speed nick on the drawbar is not opposite its spring trigger. But it is 100 to 1 that by faulty changing he has burred the dogs.

Another Twin-cylinder Puzzle.

I had made a resolve not to write about any more apparently difficult diagnoses of engine troubles, as they are usually sent me by comparative novices, who grievously misstate facts, and cause one to waste much time and thought over a matter so simple that any average repairer or practised amateur could set right in a moment if he had the machine in front of him.



Guy Lee-Evans, a successful competitor in the Cudham Hill Climb. He is seated on the 3½ h.p. single-cylinder Rex he rode at Brooklands on Easter Monday.

But I have just received a puzzle from a practised rider that promises to require much solution, and will probably turn out to be a combination of several troubles. Here is the description as given me:

Engine.—6 h.p. twin, a.o.i.v., dual ignition, H.T. magneto, battery and trembler coils, B. and B. carburetter.

Tested points.—Both ignitions perfect, mixture perfect (responsive accurately to air lever), carburetter clean, gauzes clean, petrol supply perfect, all levers rigid in any position.

Symptoms.—Engine gets very hot, particularly in front cylinder; runs very irregularly, suddenly shooting ahead and then dropping back without levers being touched; government by throttle impossible; engine will not run on less than half-throttle, and on throttle being opened an extra $\frac{1}{32}$in., instantly bounds away at full speed.

QUESTION & REPLIES.

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not **must be accompanied with a stamped addressed envelope for reply.**

To Prevent Tyre Creeping.

I have a 3½ h.p. Minerva with an extra heavy Continental tyre on the back wheel. This has started to creep, and pulls the valve out of its seating. Please tell me why it does this, and also if there is any cure except security bolts? I may say that my weight is only 8 st. 8 lbs.—H.G.A.

Through continual use the tyre has probably got to fit the rim more easily, consequently it does not grip the edges of the rim to the same extent. This trouble can only be cured by fitting security bolts. Inflate the tyre harder.

What's Wrong!

My 3½ h.p. Peugeot motor cycle has run well uphill, but now will not run unless all throttle on and all air off. Compression good. I have had engine down and thoroughly cleaned it, carburetter clean, spray clean, and petrol flowing freely. Float and needle appear to be all right. When I get running and close throttle and increase air, explosions occur in silencer badly. I use accumulators. —H.O.A.

It seems very much as if something is obstructing the petrol supply. Occasionally foreign obstacles float about the carburetter float chamber and get temporarily wedged in the petrol orifices. As soon as the suction from the engine ceases they float clear, so that their presence cannot be detected immediately. In the meantime, however, you might try a larger jet, if after testing the level of the spirit you find it to be correct. Then turn your attention to the automatic inlet valve, as it may have something to do with the matter.

Low Gear and Overheating.

I have a 3 h.p. air-cooled Humber tricar, with chain drive, free engine clutch, to which I think of fitting a two-speed gear. I should be glad to know if you can recommend a gear for good serviceable work. I am told that a two-speed gear is not satisfactory on an air-cooled engine, as on the low gear engine gets too hot. Is this correct? A friend tells me I must have a water-cooled engine when a two-speed gear is fitted.—COOL GEAR.

As your machine is chain driven, and resembles the Phelon and Moore, their gear will probably fit your machine the easiest. Certainly, with an air-cooled engine greater skill in driving is necessary, but as the engine is not a very big one you may not have very much trouble. Provided you keep the throttle closed as much as possible, lubricate freely, and the engine is in proper order, overheating should not be experienced unless your district is very

An exciting tussle over a distance of three miles on the Cannng Town Track, between C. R. Collier and H. V. Colver. The latter won by the small margin of three seconds.

hilly. Try running without a fan first of all, but if you experience excessive overheating you had better have one fitted later.

Commencing Motor Cycling.

I am thinking of going in for a motor bicycle, but I know absolutely nothing about them. One or two friends say buy a second-hand one to start with; some say get a new one. Please give me your advice. Also will you recommend me a good make, and state what horse-power, tyres, etc., might suit me. I want a machine for week-end touring and country riding, etc., not for business purposes.—L.L., Cheshire.

It is not so necessary nowadays to practise on a second-hand machine before buying a new one, as the driving and control have been rendered so very simple. Of course, it would be a go idea to go in for a first grade sing cylinder machine, second-hand, in orc to get a little experience. If you lo through our advertisement colum and send us a numbered list of t motor bicycles which you think wo suit you, keeping a key for referen we will place them in order of merit.

How to Prevent Explosions in Silencer.

I have been out for the fi time on my new 3½ h tourist Rex (magneto). T machine ran well, but on r ing with a raised exha without using the switch there v repeated and continuous firing in exhaust box or silencer. If the swi alone was used without rais the exhaust, on releasing the swi and restoring the ignition there a loud explosion in the silencer. I raised the exhaust and used switch, immediately I restored current, keeping the exhaust rais the explosions in the silencer rec menced, or if I dropped the exha lifter and switched on (eit simultaneously or otherwise), th was again an explosion in silencer. How can I avoid it F.M.

You can prevent the explosions closing the air and throttle imme ately you raise the valve lifter. T noise is, however, usually due to a stricted silencer or running on an i perfect mixture.

Passenger Attachment and Sluggish Starting

What is the best method taking a passenger on my h.p. Centaur motor bicyc Either trailer, forecar, or si car? I have great difficulty starting the engine when co though I put paraffin in the va tap so that the engine is not s with valve lifted. Accumulators over four volts, and I have tried n plugs, and all the wires are right far as can be seen. The coil is trembler. When warm the eng will start up first time. What I w to know is if I can have anythi done so that the machine will st up first or second turn when cold NOVICE, Norfolk.

You would probably find the sidecar be the most satisfactory means of t

ng a passenger. A free engine would e almost indispensable, but a two-peed gear would be better still. Pro-ably the trouble in starting is because ou get too much air through the car-uretter at slow speeds when the ngine is cold. This may be overcome y fitting a shutter over the air intake, s described in *The Motor Cycle* of ebruary 12th, page 121, or fitting the ext size smaller air adapter if the car-uretter is a Longuemare.

Fitting Fibre Rings.

I find that when ordering new fibre rings for my twin-cylinder magneto, Simms-Bosch, these are invariably sent too large in diameter. Up to the present, I have filed or cut same to make a fit with the holder. By this method I find it practically impossible to make an exactly concentric fit, thus causing a larger break of the platinum points for one cylinder than the other. Can you kindly inform me of some method of fitting these rings, whereby a concentric fit is assured?—E.C.S.

he best plan is not to attempt to re-uce the size of the ring at all. These ings are purposely made rather too arge, so that when they have shrunk ney are still a good fit. The best way o proceed is as follows: Set the groove n the ring opposite the little stud in ne ring holder, then get two pieces of at wood, place one against the ring nd the other against the holder, put ne lot between the jaws of a fairly arge vice and screw up carefully and radually, when the ring will be forced ome without difficulty.

Misfiring on Hills.

I have a mysterious trouble with my 3 h.p. Triumph motor bicycle which I shall be glad if you can explain. It runs splendidly on the stand, fast or slow, as regular as one could wish. So it does on a level road or down hill. But going up a hill or even a slope it begins to misfire about half-way up if long, or right on the crest if short. On all the hills round here I know almost exactly where it will commence to misfire. As soon as it gets over the crest of the hill it is all right again. It will miss going up a slope, although the engine is running fast. It is a 1905 (October) machine. Can you suggest an explanation? The wiring and accumulators seem all right, and the platinum points on the contact breaker seem to make a good connection, and the plug is all right.—G.N.M., Brighton.

Without actually seeing the machine it s difficult for us to say what is the natter with it, but from what you state n your letter it appears to us that the etrol is not reaching the carburetter n sufficient quantities. We should herefore recommend you to carefully verhaul the carburetter. The misfir-ng may also be due to you failing to lose the air lever slightly when the peed of the machine falls off. Try the parking plug points closer together, nd if battery ignited attend to charg-ng of accumulators.

Engine Ceases Firing on Rough Roads.

I have a 3½ h.p. White and Poppe motor cycle, assembled with Chater-Lea fittings. After adapting a larger carburetter, viz., Model H, and dispensing with a Model E, this machine has been a constant source of pleasure, and is beautifully sweet in running, but during the last few days the carburetter seems to have become affected. The symptoms are that when traversing bumpy ground motor ceases to fire. I open extra air momentarily and that remedies it. Why, after fifteen months, should this occur? I have not even fitted new inlet or exhaust valve springs (m.o.) Could this account for the sudden trouble, owing, perhaps, to the sluggish closing of valves? I might add that I have had carburetter down, and it seems faultless, and needle still fits perfectly and is quite petrol tight when down.—W.W.

The trouble seems to be due more to the carburetter than to anything else. The best thing to do is to remove the jet and see how far up the jet tube the petrol rises. It should rise to within about ⅛in. of the top. If, however, the petrol is normally above this point, the carburetter becomes flooded over rough roads and opening the air temporarily cures the trouble. If you cannot cure the trouble you should fit a controller over the needle valve to prevent the vibration altering the level of the spirit.

Backfiring in One Cylinder.

I have a 6 h.p. Fafnir tricar, and every time the engines work, one cylinder repeatedly fires back into the carburetter. On examining the cylinder I find that on the explosion stroke the inlet valve opens a little and allows a little of the gas to escape. I should be pleased if you could suggest a remedy. Also when the piston rises on the compression stroke the inlet valves leak. I have ground both in properly and tried springs of different strengths, and still to no purpose. I may mention that after the engines start up they eventually slow down, and will not run at a uniform speed when the tricar is still. Do you think that the back firing poisons the gas as it comes from the carburetter, and thus destroys the mixture?—L.T.G.

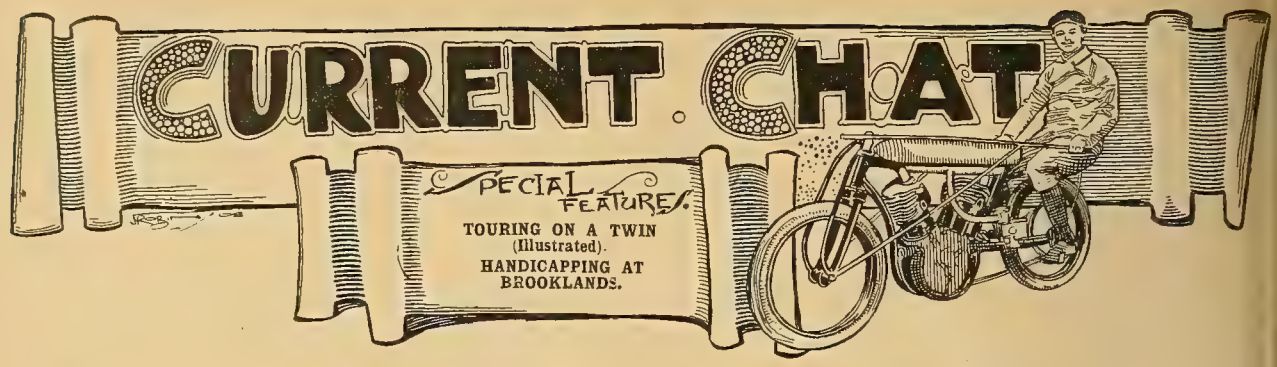
Either one of the inlet valves is not correctly timed, or one valve opens slightly more than the other, or the inlet pipes are not suitably arranged, causing a greater quantity of mixture to enter one cylinder than the other. If you can give us a rough sketch of the arrangement of your carburetter, perhaps we may help you. Your engine is fitted with adjustable tappets, so that you can easily alter the openings. It is possible that the carburetter is not properly adjusted. The leakage past the inlet valves can be cured by carefully grinding in the valves and fitting new copper and asbestos washers under the securing nuts.

Accumulator Acid.

(1.) Must one empty solution from accumulator when E.M.F. falls below 4 volts and refill with fresh acid before recharging, or will the old solution still serve, provided it is over top of the plates? (2.) If it is not necessary to fill with fresh acid each time cell is discharged, how often should fresh acid be put in? (3.) Can one determine proper strength of solution for refilling accumulator without using an hydrometer? Can one not measure out a certain bulk of acid, and add to it a certain bulk of water? If so, what is the proper proportion of acid (commercial sulphuric) to water, bulk for bulk, to make a solution of 1.20 specific gravity?—G.H. King.

(1 and 2.) There is no need to fill the accumulators with fresh acid (electrolyte) every time. It is, however, important to keep the level of the liquid about ¼in. above the plates and to keep its specific gravity at 1.20. (3.) This can be determined by using a hydrometer, and by adding acid when required. The proportion of acid to water is 1 to 5. Use distilled water and pure brimstone sulphuric acid, not what is known as "commercial" acid.

First Brooklands Open Motor Cycle Race on Easter Monday. Preparing for the start.



Next Week's Issue.

Next Wednesday's issue of *The Motor Cycle* will be a special Spring number, full of special articles and illustrations of absorbing interest. Order a copy now to prevent disappointment.

First Motor Cycle Race at Brooklands

We learn that the first, second, and third machines in the first open motor cycle race ever contested at Brooklands, during the Easter meeting, were fitted with Dunlop tyres.

Motor Cycles Exempted.

It is proposed to tax motor cars in America according to weight, five dollars per year being the minimum fee. As in the past, there is a clause exempting motor cycles from this new bill.

Another Race at Brooklands.

The first Brooklands motor cycle race at Easter was more in the nature of an experiment. It is only natural that riders of small single-cylinder machines will refuse to be pitted against riders of 7-9 h.p. twins on equal terms, and we note with pleasure that the next race, fixed for Saturday, May 9th, will be a handicap.

Particulars of the Race.

Although the conditions for the second open race have not yet been issued, the following particulars are available: The Motor Cycle Handicap Plate of 25 sovs.—The entrant of the winner to receive 15 sovs., the entrant of the second 7 sovs., and the entrant of the third 3 sovs. Entries close on May 1st, fee 10s. 6d. p.p. Twenty-five entries, or the race may be void at the option of the executive.

Another Police Trap.

Between Chichester and Arundel, about three miles from the first-named town, there is a police trap in operation, writes a Gloucester reader.

Associateship Popular.

The number of R.A.C. associates elected up to the present is 225, and there is a lengthy list of candidates for the next election. The Associates Department at 112, Piccadilly, is now in constant use.

The A.C.U. Annual Hill Climb.

In the event of a suitable venue being found in enclosed grounds on which to hold the annual A.C.U. hill-climb, classes will be arranged to suit all types of touring machines. The A.C.U. secretary will be pleased to hear from any member who can suggest a likely hill situated in private grounds. The event is fixed for Saturday, May 16th.

Motor Cycling Club.

On Saturday next, May 2nd, at 3 p.m., the members' hill-climbing competition for motor cycles and cars will be held at Sharpenhoe Hill, near Luton. Entries closed on Monday last to the Trials hon. sec., W. H. Wells, 15, Wilson Street, E.C. Three classes for motor cycles will be included. 1, Single-cylinder bicycles; 2, multi-cylinder bicycles; 3, passenger motor cycles. The formula to decide the order of merit will be $\frac{T \times C}{W}$, *i.e.*, time multiplied by cubic capacity in centimetres, divided by the weight. The awards in each class are—first, gold medal; second, silver medal; third, bronze medal.

London Statistics.

From December 1st, 1907, to 29th February, 1908, applications for the registration of 250 motor cycles were dealt with by the London County Council, bringing the total of these vehicles up to 8,141. The number of licenses to drive cars and motor cycles issued was 5,801.

Motor Cycle Union of Ireland (Ulster Centre).

The following competitions have been arranged: June 1st, reliability run arranged by the chairman, for which he will give prizes; June 27th, inter-centre contest for Triumph Cup (provisional); July 14th and 15th, Murat Trophy contest of 400 miles (open); July 25th, hill-climb at Ballybannon.

A Peculiar Specification.

Curious blunders are frequently made in advertisements owing to indistinct writing, but the two following from the *Bradford Observer*, sent us by a local reader, are really funny: Motor tri-cycle, 2¾ h.p. Humber engine and a *cooler*; front basket, and fitted with *Fielding and Moode's* patent clutch. Motor cycle, 2¼ h.p.; fitted with *new and break* coil.

The First Race at the Stadium.

On Monday week the first motor-cycle race at the new Stadium at Shepherd's Bush will be held, when the opening ceremony takes place. The Finchley Harriers are running a meeting there, and included in the programme will be a five miles motor-cycle handicap, open to genuine touring machines not exceeding 90 by 90 mm. with a 4 to 1 gear. Further particulars and entry forms can be obtained of Mr. C. R. Staine, 2 Broomhouse Road, Hurlingham, S.W.

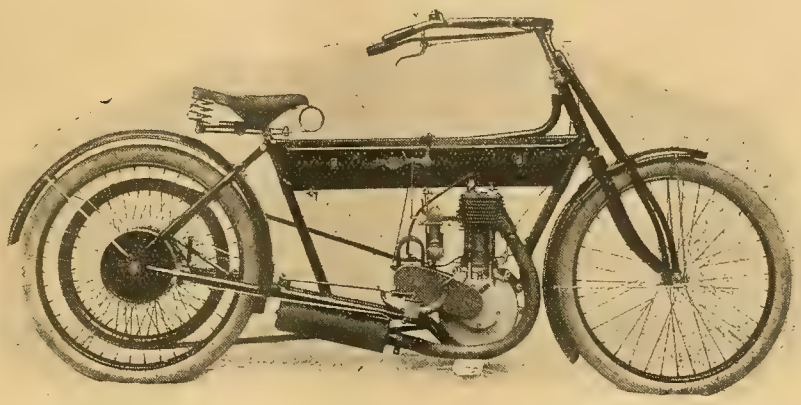
A representative meet of Essex Motor Club members on the occasion of the 1908 opening run.

MOTOR CYCLE TOURING

"THE CAR ON TWO WHEELS."

"One requires a two-speed gear that is reliable and would stand 10,000 miles without spending money on repairing; a good clutch that would enable one to start again on any hill that one may stop on to admire the scenery."

Extract from Mr. A. Candler's lecture before the Auto Cycle Union, April 10th., 1908.



ROC 4 h.p. new military model, ball-bearing engine, clutch-speed-gear, **48 gns.**
ROC conversion Set to convert any make of machine, **10 gns.**

These essentials are part of the ROC patented clutch and speed gear system with the added advantage of easy hand starting from live axle. No other machine incorporates these same advantages. Avoid imitations. The ROC patents cover the live axle, hand starting metal to metal clutch, and speed gears in combination herewith. The ROC by its low riding position and car-like conveniences is aptly termed "the car on two wheels."

THE BELT THAT GRIPS.

The Watawata has a tenacity of grip to which other motor cycle belts are strangers.

That means power economy.

The Watawata is constructed solely of leather, and on scientific principles.

That means durability.

The Watawata is made in such a way as to render stretching or giving almost impossible.

That means a saving in trouble.

The Watawata is potent in the prevention of power wastage, so that the force of your engine is always rightly and fully directed.

That's why every motor cyclist can achieve better results with the Watawata, and why every reader of these words should test it.

Watawata

10,000 miles without a puncture!

41, WELLINGTON STREET, COVENT GARDEN, LONDON, W.C.

THE PALMER TYRE, LTD., 119, SHAFTESBURY AVENUE, W.C. Nov. 1st, 1907

Gentlemen,—I have pleasure in forwarding you herewith a 2¼in. Palmer Cord Motor Cycle Cover and Tube which has now done nearly 10,000 miles, and as you will see, is as good as ever.

I fitted it to the front wheel of my motor cycle in May, 1906, and took it off to-day to see what it was like inside.

It has only once been touched with the pump since fitted, and has never been punctured.

It has carried me safely through many important competitions, including A.C.C. Land's End to John-o'-Groat's Trial, 1906; London to Plymouth; and six days' trial, 1907; M.C.C. London to Edinburgh, 1907, and also several long tours.

The ribs are not worn much, and both cover and tube look like being good enough for next season.

Yours faithfully, H. GILLARD COVE.

The Longevity of Palmer Motor Cycle Tyres

becomes more than a mere statement in face of the above experience; it is a fact!

Write for our Manual, gratis and post free.

THE PALMER TYRE, LTD.,

Shaftesbury Avenue, London, W.C.

All Motor Cyclists should join the

AUTO-CYCLE UNION

And secure the following advantages:

1. Admission to Papers and Discussions on subjects of interest to motor cyclists.
2. Legal assistance.
3. Free registration for Open Competitions.
4. Special Touring facilities and Customs advantages on the Continent.
5. Free entry of members' motor bicycles into France, Holland, Belgium, Switzerland.
6. Information and assistance in planning Tours.
7. Information and assistance as to Customs formalities and duties, etc.
8. Reduced entrance fees in Races and Trials.
9. A copy, post free, of the Automobile Handbook.
10. Information as to best motor storage, repairers, and supplies of fuel.
11. A copy, post free, weekly of the Royal Automobile Club Journal.
12. Information and advice generally on motor cycling matters.
13. The right to exhibit the badge of the Auto-Cycle Union, and the special privileges attached thereto.
14. Full Associateship of the Royal Automobile Club.
15. Use of Club Rooms at 112, Piccadilly, London, W.

ENTRANCE FEE, 5s. ANNUAL SUBSCRIPTION: Town Members, £1 1s.; Country Members, 10s. 6d.

.....

To the SECRETARY, AUTO-CYCLE UNION,
18, DOWN STREET, PICCADILLY, W.

I desire to become a Member of the AUTO-CYCLE UNION, *and shall be glad if you will place my name before the Committee at its next meeting. Enclosed please find my Entrance Fee and Subscription of .....*

IN THE FIRST MOTOR CYCLE RACE AT BROOKLANDS, ON EASTER MONDAY,

PEUGEOT ENGINES

ONCE MORE proved their

SUPERIORITY

OVER ALL OTHERS.

THE FASTEST FOR RACING.
THE BEST FOR TOURING
WITH OR WITHOUT A SIDECAR.

Ask your cycle maker to fit one to your present mount.

INSIST ON A "PEUGEOT." DO NOT BE PUT OFF WITH ONE 'JUST AS GOOD.'

J. TAYLOR,

318, Percy Road, BIRMINGHAM,

Sole Wholesale Agent.

Light-weight Trials at Nice.

The first event in the above competition, organised by the Nice A.C. and the T.C.F., took place on Saturday last and consisted of a reliability trial over a hilly and difficult course about twenty-five miles in length. In the multi-cylinder class F. Larippe (Moto Rêve) was first in 1h. 2m., J. Larippe (Moto Rêve) second 1h. 20m., and Guerrieri (Alcyon) third in 1h. 30m. In the single-cylinder class there were ten entries, the winner being Anken (K.D.), 1h. 8m. 28s.; 2, Borel (K.D.), 1h. 12m. 16s.; 3, F. Ellena (Alcyon), 1h. 22m. On Sunday the flying kilometre race was to have been held on the Promenade des Anglais, and on Monday the hill-climbing competition on La Turbie (pedalling gear barred).

The Winning Machine at Brooklands.

Several readers have written asking for the name of the maker of the winning N.L.G. motor cycle at Brooklands Track on Easter Monday. Doubtless numerous other readers who have not written have a desire for the same information. The owner and maker of the machine is Mr. A. G. Forster, North London Garage, 15, Corsica Street, Highbury, N., who with his brother is proprietor of a motor garage in the north of London. The letters N.L.G. signify North London Garage. The Messrs. Forster have for years taken an interest in motor cycling, but the winning machine at Brooklands is the first and only one yet made by them. Mr. Cook's success on this experimental machine should give sufficient encouragement to Messrs. Forster to exploit the N.L.G. still further.

Land's to John-o'-Groat's Records.

In view of possible attempts to create a new End-to-end motor cycle record this year, it is interesting to note that the existing records over this classical route are as follows: Motor car, 42h. 5m.; motor cycle, 48h. 36m.; push cycle, 3 days 8h. 4m.; walking, 17 days 12h. With the exception of the car record all were officially timed.

The M.C.C. London-Edinburgh Run.

This annual event is the most important of the Whitsuntide motor cycling fixtures, and will doubtless attract as large and representative an entry as in the past. Both motor cyclists and car drivers will take part, and a good deal of interest will be taken in the performances of one or two motor bicycles with sidecars attached, which we understand will start on this twenty-four hours' run. We wish the drivers every success, and there is no reason why they should not accomplish the journey within the schedule time, provided the driver and passenger are of the right sort, *i.e.*, in possession of the requisite stamina and persistence to carry out long-distance runs. Motor cyclists should not attempt the journey on anything but new tyres, and for the night journey two powerful lamps should be carried.

Handicapping at Brooklands.

Since the early portion of this issue went to press we learn from Mr. F. Straight, the secretary of the A.C.U., that the handicapping for the motor cycle races at Brooklands has been entrusted to him. We feel sure that the allotting of starts could not have been left in more able hands, nevertheless, we should like to see the handicap we suggest tried, as we feel sure it would provide an exciting contest.

Distinguishing Numbers in the Brooklands Race.

We understand from certain officials of the A.C.U. that considerable trouble has been given by competitors who took part in the first Brooklands Motor Cycle Race, owing to the fact that great difficulty was experienced in getting back the distinguishing numbers which were lent to them on the occasion of the race. The competitors had to pay nothing for these numbers, but in future no entrant will be allowed to compete unless he deposits 2s. 6d. with the secretary, which will not be returned to him unless the numbers are given back complete.

FUTURE EVENTS.

April 29—A.C.U. Quarterly Trial.
May 2—M.C.C. Members' Hill-climb, at Sharpenhoe, near Luton.
" 6—"The Motor Cycle" Special Spring Number
" 9—Brooklands Races. Motor Cycle Handicap Plate.
" 11—Finchley Harriers First Motor Cycle Race at the Stadium.
" 12-18—Auto Cycle Club of France Reliability Trials.
" 16—A.C.U. Annual Hill-climb.
" 16—Essex M.C. Open Hill-climb.
June 5-8—M.C.C. LONDON-EDINBURGH RUN and return for Schulte Cup Competition, and special cup for motor bicyclists.
" 6 and 8—Brooklands A.R.C. Whitsun Meeting.
" 27—M.C.C. Inter-team Trials for "The Motor Cycle" Fifty Guineas Challenge Cup. Prospective competitors: Motor Cycling Club, Coventry M.C., Great Yarmouth M.C.C., and Birmingham M.C.C.
" ——A.C.U. 24 Hours' Ride.
July 4—Essex M.C. Open 200 Miles Non-stop Run.
" 13-18—A.C.U. LAND'S END TO JOHN-O'-GROAT'S SIX DAYS' RELIABILITY TRIAL.
" 25—Motor Cycling Club's Petrol Consumption Tests.
Aug. 3-4—M.C.C. Run from London to Land's End and Back for Charles Jarrott Cup.
" 8—Essex M.C. Open Race Meeting at the Stadium, Shepherd's Bush, W.

The Special Spring Number on May 6th.

The principal contents of the special Spring number to be published next Wednesday are: Photography and Motor Cycling (Illustrated). By AN 409. Our Historic Highways (Illustrated). By Reginald Wellbye. Motor Cycling for Health: Being the Experiences of Medical Men who are also Motor Cyclists. How the New Mount Scored (Storyette). The Motor Cycle and the Variety Stage (Illustrated). By Percy Delevine. The Joys of an Expert. By S. W. O. Len Head, Esq. The Motor Cycle for Business (Illustrated). By "Bagman." Extract from *The Motor Cycle* of 2008 (Illustrated). The Troubles of a Novice. By S. B. S. Contact Breakers for Twin-cylinder Engines. By Ixion. Motor Cycling for Ladies (Illustrated). The Motor Cyclist's Ideal. Result of our plebiscite. Illustrated description of the A.C.U. Quarterly Trials. Brooklands: An Impression of Speed. Full page art supplement in colours. Drawn by E. H. Thomas.

Essex Open Hill Climb Postponed.

We are informed that the Essex Motor Club Hill-climb has been postponed from the 9th until 15th May, so that it will not clash with the Brooklands motor cycle races, which will be held on the 9th.

The End-to-end Record.

Mr. Harold Williamson informs us that he thinks with good luck the End-to-end record figures should come down from 48 to 36 hours. If it does not come below this figure during the year he has expressed his intention of having another try himself on his Rex.

Auto Cycle Club of France Reliability Trial.

This important event (May 12th to 18th) has received a total entry of forty-four. Bucquet, well-known to our readers as a very successful rider, will again bestride a light Griffon. As he was the winner of the last Paris-Ostend-Paris Motor Cycle Trial, his entry has caused much interest. Voiturettes will compete with the motor cycles and tricars, but in a separate category.

Kentish Police Active.

We are advised that all through Kent the police are waging an active campaign against motorists. The most notorious trap commences at Rainham, four miles beyond Chatham, on the main London-Dover Road, and extends to Sittingbourne, six miles beyond Rainham. Timing operations are conducted at Rainham, and again at Sittingbourne, and *vice versa*. Traps also exist on the roads from Maidstone to Seven Oaks, and in the surrounding district.

The Herts County A.C. Open Hill Climb for Motor Cycles.

We heard at the last moment that the open hill-climb fixed for Saturday last was postponed. As we understand that the A.C.U. Quarterly Trials were relegated to Wednesday, April 29th, so that they did not clash with the open hill-climb, it would appear that some explanation of the postponement should be forthcoming.

The M.C.C. Team Competition.

The above event, which is a contest for *The Motor Cycle* Fifty Guinea Challenge Cup over 100 miles, between teams of riders from various clubs, will take place on June 27th. The course selected is near Daventry, Northants. Will club secretaries, who have not received particulars of this event, write to the Trials hon. sec., Mr. J. Van Hooydonk, Spring Villa, North Finchley, N, for a copy of the rules and an entry form. The rules were published in *The Motor Cycle* of April 15th, page 303. We shall be glad to hear of club teams intending to compete for inclusion in our list of Future Events. Four clubs have already decided to send a team.

HINTS AND TIPS FOR MOTOR CYCLISTS.

By Road Rider.

(*Continued from page 315.*)

LIGHTING FRONT NUMBER.

201. On a motor bicycle the aim should be to avoid casting disconcerting shadows. This is only achieved by setting lamp well back against steering head, and setting number-plate right forward on front edge of mudguard.

On a tricar exceeding 3 cwt. in weight a tail lamp and rear illumination are required by the L.G.B.'s doubtful interpretation of a carelessly framed law.

On a light tricar, not exceeding 3 cwt., set the side lamps well back, and put a number on each side well in advance of the lamps, preferably painting it on the fore body. It is a mistake to carry a plate projecting from the headlight—it is sure to get damaged.

LIGHTWEIGHT MOTOR BICYCLES.

202. Much ingenuity and capital have been expended in the effort to produce motor bicycles weighing 70 lbs. or so, and for riders not exceeding ten stones, and in favourable districts, they provide handy little mounts for those who do not yearn for speed, and are willing to give pedal assistance when it is required.

For general touring purposes I should recommend a more powerful mount, and my advice is confirmed by the fact that hundreds of riders who know how to get the last ounce out of a good 3½ h.p. 150 lb. machine, ardently long for a two-speed gear. The 1906 Land's End to John-o'-Groat's trial included bicycles ranging in power from 3 to 7 h.p., and only the two-speeded machines got through without being stopped on a hill. The modern lightweight machines of under 80 lbs. make very meritorious little runabouts, but certain facts are true of all present-day lightweight low power machines.

(1.) With a man not exceeding ten stones in the saddle they can climb ascents like Dashwood with pedal assistance.

(2.) Petrol and oil capacity. Luggage and tool kit must be sternly reduced to the lowest minimum, and a spring fork is quite as essential, if not more so, than on a heavier machine.

(3.) The gear is too high. It is commonly asserted that if 3½ h.p. is a suitable engine for a 150 lb. machine, 1¾ h.p. is ample for a 70 lb. cycle. This is true with the important proviso that the gear should also be proportionate. Under present conditions, if the engine pulley is small enough to afford such a gear, the belt will usually give trouble. Some such device for combining a low gear with a large engine pulley, as is employed on the 1¾ h.p. F.N., would be an improvement on all machines of this type.

MOTOR BICYCLE STANDS.

203. In selecting a motor bicycle stand take care that:

(a.) It is rigid when in use.

(b.) That it is attached to the chain-stays and not to the rear axle, otherwise it is useless when the wheel is removed.

(c.) That it has no small parts which are likely to jar off.

(d.) That it is easily and swiftly lowered and fastened up again. A spring catch is desirable, as butterfly nuts work loose.

MOUNTING A MOTOR BICYCLE.

204. A novice usually wonders whether he will ever be able to get on to his motor bicycle. It is best to practise mounting by pedal or footrest down a falling grade, with the belt removed. The art is soon acquired, and becomes perfectly automatic. I invariably mount clean off the ground, which I consider much safer than feeling for a pedal or footrest. If the rider is nervous he may momentarily raise the valve or switch off while swinging himself into the saddle, but unless he learns to jump on cleanly with the engine running, he will only be able to start on the flat or downhill. Starting by sitting in the saddle and pedalling is the slowest and most tiring method of all, and no rider should rest content until he has mastered either the clean jump or the pedal hop. With a variable gear there is no need for any exertion at all. Simply inject paraffin to free the rings, sit athwart the machine, engage low gear, set levers, raise valve, give two smart pushes against the ground, one with each foot, drop valve, and engine should start.

MUDGUARDS FOR MOTOR BICYCLES.

205. Mudguards should be four inches wide, stoutly stayed. The front guard should have a large flap to shield engine and magneto from mud. The rear guard should be hinged abaft of the rear forks, and its stays should be clipped detachably near the hub.

MUDGUARDS FOR TRICARS.

206. All tricars should have inner shields to the front wings, since the radiators, steering gear, and fore brakes will otherwise rapidly be choked up with mud and become particularly inoperative. Patent leather shields are easily made and kept clean. It is a mistake to attach hooters and lamp brackets to the guards—they need all the staying makers provide, without being called upon to carry additional weight.

NAILCATCHERS.

207. Many punctures may be averted by the use of nailcatchers, since a nail seldom really penetrates the cover and tube at the first revolution of the wheel after it has been picked up. Nailcatchers are, therefore, well worth fitting. Chains may be bought which trail across the tyre, and are carried by clips on the forks. Some stands have hollow horseshoes of rubber for this purpose. A home-made set may be cheaply rigged by anchoring stout steel wire to two little clips made to fit the back stays. They should be so set that the wire clears the tyre by a fraction of an inch.

Competitors in the first Brooklands motor cycle race parading to the start.

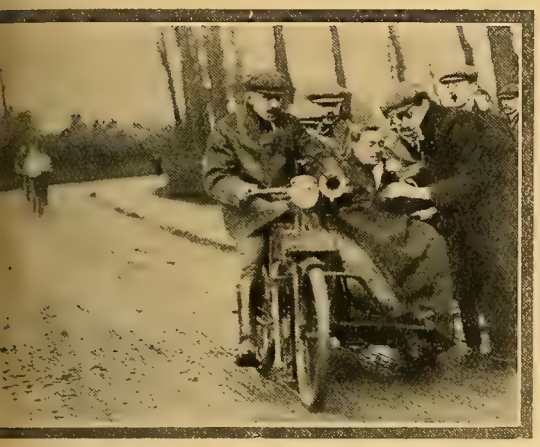
ON TOUR.

208. When the big car sweeps derisively by you what time you sit and tinker on the shadeless road, remember your humiliation is not to be ascribed to the fact that the car is more reliable than your bicycle, but to the fact that the chauffeur gave it a clean up and look over last night, what time you were idly buying picture postcards. Make it a rule when on tour to glance over the machine every evening, and specially see that the batteries are charged, the belt and fastener in good condition, and the tyres free from cuts and holes.

"THE AUTOCAR" contains each week much interesting information which, although written in regard to motor cars, is also applicable to tricars and motor bicycles. It is published weekly, price 3d., and can be obtained from all newsagents and bookstalls.

Auto Cycle Union Quarterly Trial.

WENTY-FIVE entries were received up to Friday last for the April Quarterly Trial, which takes place to-day (Wednesday), starting from the Chequers Hotel, Uxbridge, at 9 a.m. The will be the same as in the previous trials, viz., Uxbridge, Beaconsfield, High Wycombe, Dash-



e Marathon Trial Race was held last Saturday in connection with the pic Games. Our picture shows one of the runners (Appleby) who ped out, being taken up by a motor cyclist Samaritan with a side-car.

l Hill, Wheatley, Islip, to Banbury, returning Bicester, Aylesbury, Berkhampstead, Chesham, rsham, and Beaconsfield to Uxbridge. Competing ines will be timed both on Dashwood Hill and rsham Hill. Motor cyclists along the route are ed to make a note of any incidents they see during rial, particularly stoppages, and to report same to ecretary.

Rider and machine.	No. of cylinders.	Bore. mm.	Stroke. mm.

One of the most complete catalogues of motor cycle accessories is that issued by the Service Co., Ltd., 292, High Holborn, W.C. This list deals only with motor cycle fitments, and every reader should write for a copy.

The number of hon. correspondents of the Motor Union is to be increased, and members are asked to kindly send in the names of motorists who will undertake the duties in various districts. A list of the duties can be obtained from the secretary, 1, Albemarle Street, London, W.

CLUB NEWS.

Waterford and District M.C.C

a meeting held last week, a motor cycle club was formed Vaterford and district. A number of motor cyclists took e matter with considerable enthusiasm, and the member- ilready numbers sixteen. Mr. W. J. Cordner was elected lent; Mr. W. E. Bowers, Ferrybank, hon. sec.; and M. J. Murphy, hon. treasurer.

Sutton Coldfield A.C.

ing to the very bad weather the reliability trial, which o have been run off last Saturday, was postponed till er day; the date to be arranged at the next committee ng. The run next Saturday is to Ashby-de-la-Zouch, from headquarters 2.30 p.m.; and on Sunday, May 3rd, y run to Matlock, start from headquarters 11 a.m.

The Worcestershire M.C.C.

ing to the unsettled weather the reliability trial organ- by the above club was not as successful as it was hoped Out of thirteen entries eight faced the elements. The e was divided into four sections of twenty-six miles each, sgrove to Bromyard, Bromyard to Kington, and return same road. The trial resulted as follows :

W. Ward (3½ h.p. Triumph), non-stop, 1,000 marks; 2, arby (3⅜ h.p. Rex), one puncture, 975 marks; 3, E. ss (5-6 h.p. Rex), one puncture, 950 marks; 4, H. C. ring (4 h.p. Excelsior), inlet valve stuck three minutes, arks; and L. C. Wakeman (3½ h.p. Ariel), broken ex- lifter five minutes, 900 marks; 5, L. Pickering (5-6 h.p. contact breaker trouble, disqualified; 6, H. B. Denby p. Minerva), burst tube, disqualified; J. G. Parting- ½ h.p. Minerva), burst tube, retired.

Southern M.C.

The opening run held on Saturday last was somewhat spoilt on account of the arctic weather. Nevertheless, several enthusiastic members sat down to tea, in company with a large fire. For the first time in the annals of the club it was impossible to take the usual club photograph.

There was a large muster at the Hut, Wisley, on Sunday, the 26th.

The speed-judging contest for club members only will be held on Saturday, May 9th. Members are requested to be at the Chequers, Horley, punctually at four o'clock. No entrance fee.

Birmingham M.C.C.

A hill-climbing competition will be held on Saturday, the 2nd prox., at Rose Hill, Rednal, and five classes are included, viz.: Class A, for motor bicycles with engines not exceeding 76 by 76 mm. or equivalent; Class B, for motor bicycles with single cylinders of any capacity; Class C, for motor bicycles with more than one cylinder; Class D, for passenger motor cycles (tricars, quads, motor bicycles with trailer, etc.); and Class E, for motor cars up to 20 h.p., with full complement of passengers. Intending competitors meet at Longbridge, Northfield, at 2.30 p.m. The first competitor will be started at 3 p.m. prompt. Competitors will ride from Longbridge to the foot of Rose Hill (untimed). The distance from Longbridge to the foot of Rose Hill is one and a quarter miles (level ground), and must be covered in not less than three minutes and not more than six minutes. At the foot of Rose Hill the competitor must dismount and bring his engine to a standstill, then at a signal from the starter he must restart immediately the starter gives his signal. Electrical timing will be used.

Club News.—

Newcastle and District M.C.C.

Owing to the heavy snowfall, a small entry was experienced for the slow hill-climbing competition organised by the above club on Saturday last at Benton Bank, Newcastle-on-Tyne.

Mr. R. H. Head, chairman of the committee of the Motor Cycling Club.

Single gear class—1, *S. W. Carty (3¾ h.p. N.S.U.), time 1m. 8⅘s.; 2, B. Bradford (6 h.p. Jap), 59⅘s.; 3, D. Mallett (3¾ h.p. N.S.U.) Also ran: L. Rosenvinge (3¾ h.p. N.S.U.), B. Dodds (4 h.p. N.S.U.), F. Mallett (6 h.p. N.S.U.), S. Hudson (3½ h.p. Hobart). *S. W. Carty was disqualified owing to his gear being less than 6 to 1, and first award was given to B. Bradford.

Variable gear class—1, R. F. Speir (3½ h.p. Triumph, Roc two-speed gear), time 2m. 34s.; 2, L. Rosenvinge (3¾ h.p. N.S.U., two-speed gear), 1m. 55s.; 3, B. Dodds (3¾ h.p. N.S.U., two-speed gear). Also ran—D. Mallett (3¾ h.p. N.S.U., two-speed gear); S. W. Carty (3¾ h.p. N.S.U., two-speed gear).

Officials: Timekeeper, Mr. L. Austin; judge and starter, Mr. J. N. Grey; marshals, Mr. G. L. Bates, J. W. Dickinson, and E. B. Nicholson.

Owing to the courtesy of the Chief Constable, Dr. Wright, the course was splendidly controlled by members of the Newcastle City Constabulary.

North West London M.C.C.

The Easter tour proved most enjoyable, a start being made from Cricklewood at six o'clock on Friday morning, the 17th inst. The night's destination was Torquay, which was reached after a most enjoyable run amidst glorious scenery and perfect weather. The elements were again kind on the Saturday, when the party, after inspecting the various items of interest in the town, proceeded to Minehead *viâ* Dawlish and Teignmouth. The latter part of this route took the tourists through some of the finest scenery in Somerset, the red-surfaced road running through magnificently wooded country, and it was with great reluctance they left it behind in order to reach Minehead before dark.

Sunday morning was spent in a leisurely fashion with the exception of one enthusiast, who thought it advisable to scrape his cylinder in view of the fact that the chosen route lay through Porlock and up the famous hill. A start was made after lunch, and on arrival at the hi those who possessed variable pulleys were at once busy, several clean ascents were made. Tea was taken a charmingly situated hotel, and then a very difficult clin to Lynton was negotiated, the hill being almost unrid owing to the exceedingly loose surface. After a few batic performances, however, all arrived safely at the and proceeded to Ilfracombe, where the night was s

On Monday morning most of the party made a star home. Those remaining after a constitutional round Capstone travelled to Exeter, where a most enjoyable was spent in the cathedral. Taunton was the ni destination.

Tuesday morning, after the museum at Taunton had inspected (it is well worth a visit), the party left for and after a visit to the Roman baths a brisk run to L brought a most enjoyable tour to a close.

North Islington Conservative and Unionist M.C.

With very unseasonable weather prospects, membe this club left their London headquarters, 623, Hol Road, shortly after eight o'clock on Easter Sunday mo bound for Clacton-on-Sea. When the club had through Romford, and had got well on the road, its me suddenly had to fly for shelter from a terrible hailsto Brook Street Hill. All arrived at Clacton-on-Sea abou o'clock, and some put up at the Castle Hotel. There no improvement in Monday's weather, it was regr decided to return to London at once, and again snow an had to be encountered. At Kelvedon lunch was take an enjoyable non-stop run home was made.

South Eastern Auto Cycle Association.

At a committee meeting at headquarters several me were elected. A hill-climbing competition in the summe be held on an entirely new venue.

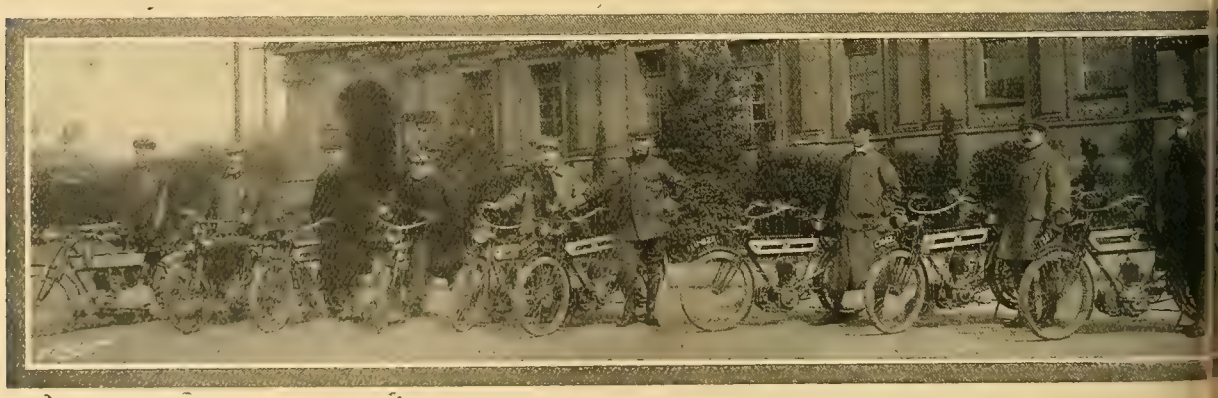
Mr. N. Willis Coles, of the Ravensbourne Motor En ing Works, Southend, has kindly offered to garage me machines free of charge.

The annual subscription to the S.E. A.A. is 10s. 6d the advantages include affiliation to the A.C.U., r entry fees in the various S.E. A.A. competitions, and touring facilities. Application forms for membership obtained from the hon. sec., H. B. Renner, Kidbrool Road, Blackheath, S.E.

Essex M.C.

In consequence of there being a race meeting at Broc on Saturday, May 9th, the date originally fixed for th hill-climb, the latter has been postponed until the fol Saturday, the 16th prox. Entries will therefore not clo the 9th prox. All entry forms and all other matter r to the hill-climb should be addressed to the trials hon. tary, Mr. E. J. Bass, Crown Hotel, Ongar, Essex.

The undermentioned are the fixtures for the month o May 3rd.—Run to Bedford.
,, 9th.—Run to Bishop's Stortford.
,, 10th.—Run to Cambridge.
,, 16th.—Open hill-climb.
,, 17th.—Speed judging contest abridged.
,, 23rd.—Inter-club competition with the West Esse
,, 24th.—Run to Dedham.
,, 30th.—Run to Stanstead Abbots.
,, 31st.—Non-stop run to Clacton-on-Sea.



The York County M.C.C. contingent ready to start for the Richmond meet on Good Friday last.

Club News.—

Crewe and District M.C.

The opening run for 1908 is fixed for Saturday next, the 2nd prox., and all members are requested to attend. The start is from the Earl of Crewe Hotel, Nantwich Road, Crewe, at 3 p.m., and the route is *viâ* Whitchurch and Wrexham. Dinner 6.30 p.m. at the Blossoms Hotel, Chester. Intending members of this club should communicate with the hon. sec., Mr. A. M. Tatham, 39, Derrington Avenue, Crewe.

Perth and District M.C.C.

The club had a very enjoyable all day run on Monday, 20th inst. Starting from Perth the route was by Pitlochry and Struan to Kinloch Rannoch, where lunch was served in the Loch Rannoch Hotel. The climb from Calvine up Trinafour was fairly stiff, but the resulting view was ample compensation. After lunch the route, which includes some very severe gradients, was over the shoulder of Schichallion, from which a splendid panorama can be seen, then across the Moor of Rannoch to Coshieville, and on to Fearnan on Loch Tay. The run to the head of the Loch at Killin, and on to the top of Glen Ogle, was rather spoilt by the loose condition of the road surface, but the long coast to Lochearnhead was a fine experience. Tea was had at St. Fillans, and the run completed by Comrie and Creiff.

Birmingham M.C.C.

On Saturday next the annual club hill-climbing competition will be held. Members will have received full particulars of this event by circular.

Coventry M.C.

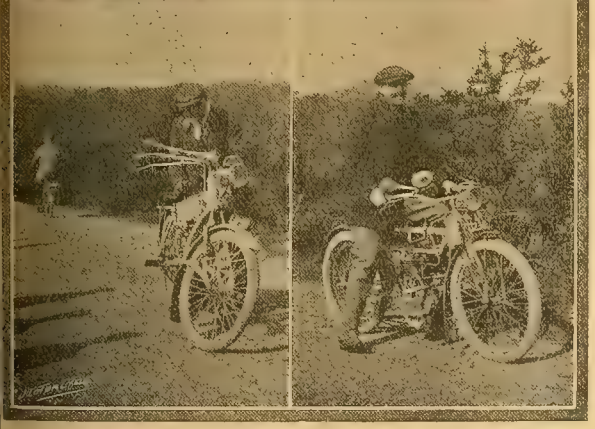
The secretary of the Coventry M.C. informs us that he has received some kind offers of assistance in connection with the Coventry to Holyhead run, which will take place on May 30th, but he is still open for a few more. Will motorists in Shrewsbury, Llangollen, Bangor, Menai, and Holyhead, who would be willing to assist as checkers or marshals, kindly communicate with Mr. E. W. Walford, 18, Hertford Street, Coventry?

North West London M.C.C.

In addition to the twelve hours reliability trial from London to Coventry and back on May 23rd, it has been decided to hold the following trials: June 13th, speed-judging competition; July 4th, hill-climb; July 25th, petrol consumption competition; September 12th, distance-judging competition; Sept. 26th, petrol quantity judging competition. Details of these trials will be issued later, but it is hoped that members of the club will note these dates in order that no other engagements may interfere with a full entry for each competition. Several new members were elected at the last committee meeting.

The Motor Cycling Club Easter Tour.

THE sixth annual Easter tour of the Motor Cycling Club was successfully carried through, Salisbury being fixed upon as a centre, and the captain of the club, Mr. E. B. Dickson, in charge. About five and twenty members and friends attended, the majority of the former riding down from London on Good Friday, and reaching the Red Lion Hotel in time for dinner. Salisbury had been selected so that members who could not get away for the whole of the time could easily reach headquarters, and this was found to be a satisfactory arrangement. On Saturday, the 18th inst., a circular tour in the New Forest was made,



Competitors in the impromptu hill-climb, Messrs. E. Gwynne and R. M. Brice.

and after lunch at the Compton Arms at Stoney Cross, an impromptu, but most successful, hill-climb was carried out, Chairman Robert Head acting as timekeeper, chief marshal, and general organiser. Many of the London stars of the motoring firmament competed, but the winner was found in Lieutenant Tremonger, a new member of the club, on a 3½ h.p. Triumph (1908). A call at the White Hart at Ringwood for tea, and thence back to Salisbury, completed a pleasant sixty to seventy miles outing.

A Run to Corfe Castle and Swanage.

On Sunday a run was made to Corfe Castle (lunch at Bankes Arms; very good, and very moderate in price), and thence *viâ* Swanage, Studland, and once more to Ringwood to tea. Some of the more impressionable members of the party were very much taken with the "attractions" to be found at Ringwood.

The Big Heart Stops Beating.

Not all were able to return to Salisbury, one of the most popular members being left at Studland, owing to a temporary failure of "his big heart," which failed to beat in its usual regular manner.

Easter Monday morning was the signal for a prompt exodus, most of the members rushing off for Brooklands, although a big business was done with the hotel garage vulcanising plant. A few of the party made a pleasant tour *viâ* Amesbury and the valley of the Avon to Marlborough, and enjoyed a view of quite the best scenery of a pleasant tour.

Some members of the Motor Cycling Club photographed at Stoney Cross.

As a motoring holiday this year's Easter tour compares favourably with its predecessors. The attendance was satisfactory, and the management excellent. The proprietor of the Red Lion catered excellently, and the charges were not to be found fault with. The weather was fine, but cold; the roads execrable, which accounted for the tyre troubles referred to.

LETTERS To The EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

An Easter Morning Ride.

[3272.]—I was interested in reading an article, viz., "An Easter Morning's Ride," last week, especially where it says, "And numerous moles, which can run very fast when they see the light of a motor cycle coming their way."

Mr. Ponting will pardon me when I say that the moles, around this part of the country at any rate, have no eyes.

SUBSCRIBER.

Low Petrol Consumption.

[3273.]—Letter No. 3245 from "E 123" is very interesting to me. I should very much like to know (a) gear, (b) stroke and bore of engine, and (c) rider's weight.

I once did sixty-six miles on exactly one quart of Pratt's, with a Clément-Garrard pattern 55 × 60 engine, gear 7½ to 1. My weight is 8 stones, and a good part of the way I was towing a friend on an ordinary bicycle.

H. GORDON TIDEY.

Unattached Riders.

[3274.]—In the same issue in which my previous letter [No. 3208] appeared I see you state that the A.C.U. has definitely decided not to enrol unattached riders except as private members at £1 1s. and 10s. 6d. each. As Mr. S. H. Fry so ably points out, if some motor cycling body will not cater for these people other bodies like the C.T.C. may.

Will the Motor Cycling Club not step into the breach and enrol associate members for an annual subscription of 5s., such members to be granted affiliation benefits only?

J. H. S.

[3275.]—I notice in your columns a discussion as to who shall cater for unattached motor cyclists. Might I point out that the Cyclists' Touring Club is, and has been doing so for a long time past? The paragraph you quote from the *Gazette*, signed by Major Rooke, does not refer to a new committee, as might perhaps be thought by non-members, but merely to the election of the motor cycle committee for the year. The Club's *Gazette* every month contains an article dealing with matters of interest to motor cyclists, who are entitled to exactly the same privileges—legal defence, hotel discounts, touring information, foreign Customs concessions, etc.—as are enjoyed by the push cyclist.

W. A. RUSSELL, Secretary C.T.C.

Two-speed Gear Trials.

[3276.]—Mr. Korber's pleading for a class devoted to passenger tourist machines in this year's hill-climbs will receive the approbation of all motor cyclists whose aim is real touring and not mere speed, and I am sure innumerable riders will endorse the wisdom of the suggestion.

For my part I am convinced that Messrs. A. W. Wall, Ltd., are not too bold in welcoming speed gear tests of the searching nature this firm have commendably pledged themselves to. The result would be far more interesting than performances designed to prove the point to which selected solo machines can be accelerated, geared, and tuned up for the mere craze of speed, yet wholly unsuitable for touring with passenger attachment over such routes as your correspondent has outlined. I am of opinion that a 4 h.p. single-cylinder engine with a pedal clutch and two-speed gear is ample, and the tests should preferably include starting from rest on the hill itself and not from a *départ lancé*.

I agree that Mr. Wall should preferably have these performances carried out under the auspices of the Auto Cycle Union. No doubt you, Mr. Editor, and the Auto Cycle Union could arrange to allow Mr. Wall an opportunity to make good his professions of the capability of his clutch and gear, and thus settle our minds on this important question.

G. C. MAILLARD.

Hill-climbing Suggestion.

[3277.]—Reading Mr. H. G. Bell's article in *The Motor Cycle* of April 15th, I was particularly struck with his remarks about uncomfortable and even dangerous speeds at which some of the powerful machines climbed the hill. Might I put forward the suggestion (for what it is worth) that a very interesting competition could be arranged on the following lines. The machine that climbs the hill nearest to a pace to be arranged, say, fifteen miles per hour, to be the winner; the machines to be standard geared. A climb up Sharpenhoe on these lines should be rather interesting.

U 560.

The Balancing of Petrol Engines.

[3278.]—In *The Motor Cycle* I read a letter from a Mr. Parry [3225] quoting one of Newton's laws and expressing surprise that I should suggest that the vibration complained of in a certain machine might very possibly be due to high compression rather than incorrect balancing of the revolving parts of the engine. I am aware that the internal forces of compression and explosion have nothing to do with the balancing of the revolving parts of an engine, but unless the flywheels are correctly proportioned these forces have a distinct effect on the vibration of the whole machine, particularly so on high-powered, high-geared, single-cylinder motor cycles. It is not necessary for me to dig up Newton nor even Aristotle to prove that increasing the compression of a given petrol engine results in a more uneven turning movement on the crankshaft, and greater variations in the angular velocity of the driving pulley, these variations or jerks or kicks being transmitted by the belt to the frame and rider, often causing him to complain of vibration.

J. T. CLARKE.

Endorsement of Licenses.

[3279.]—As one of your oldest and most constant readers might I encroach upon your valuable space to ask if any of your readers can explain the following, or if you know of a similar case?

In August of 1905 I was fined and my license endorsed. In 1906 this was again copied on to my license, on renewal; then in 1907 the authorities let me off with a clean sheet, while now this year they again fill in the endorsement and will give me no explanation. Each license in 1906-7-8 has been signed by the same registrar. Is such a proceeding as this legal?

Can anyone tell me if any motor cycle races have ever been held on this side of the border? And if so, where? Why could someone not organise a meeting here in Glasgow, where we have, to my knowledge, two excellent banked cycle tracks, namely, Hampden and Ibrox, where some excellent and perfectly safe racing might be indulged in with engines not exceeding, say, 76 mm. by 80 mm.?

GEO. GILMOUR, JUN.

[Motor cycle races were held in Glasgow on July 9th, 1904, at Celtic Park.—ED.]

The Price of Petrol Spirit.

[3280.]—Having regard to statements recently made in the press that there are large quantities of petrol spirit lying at American exporting centres, it seems somewhat inconsistent that the price of this useful commodity should keep up as it does. This is somewhat accounted for by the difficulty the importers have in dealing with the arrangements for the discharge of shipments of motor spirit, arrangements which appear to be in the hands of the Thames Conservancy, and which place the distributers in a difficult position, inasmuch as, while they have great facilities for unloading spirit at a much more convenient, and, consequently, less expensive place than at present permitted, they are debarred from doing so by the existing conditions of the Conservancy Board.

Motoring has become a national pastime, and whether it be the owner of a £1,000 car or the possessor of a motor cycle, the question of the cost of petrol is equally serious, and is a large factor to be considered in the development of motoring, whether as a pastime or an industry. This being so, surely some representations should be made to induce the authorities to re-arrange their conditions of unloading to meet the requirements of the importer, as it must be patent to all that by so doing the natural result would be a material reduction in the cost of petrol to the consumer.

FRED C. WIFFEN,
Hon. sec. Brighton Cyclist Club (Motor Section).

A Dissatisfied Owner of a Twin.

[3281.]—In reply to "A Dissatisfied Owner of a Twin," who states in *The Motor Cycle*, issue April 22nd, that after riding 4,000 miles he found everything in his engine in a wretched state of wear, I can only think that this state of things is entirely the fault of the rider. A properly constructed twin-cylinder engine, if handled with the same judgment necessary for the welfare of a single-cylinder engine, will wear equally as long. Personally, I have ridden a twin-cylinder engine over 10,000 miles without ever having to renew a single part, except valve cotters, and at the end of that distance there was not a loose bearing in the engine. I recently saw a 5 h.p. Vindec engine taken apart, which had been run considerably over 10,000 miles, and it was in practically as good condition as when new, though no new parts had ever been fitted. The majority of owners of motor cycles thoroughly believe they take the best care of their machines and regularly oil them, but I have known both single and twin-cylinder engines which have been practically racked to pieces before they had been run 100 miles, simply through carelessness on the part of the riders. If "Dissatisfied" would like some opinions of users of 7 h.p. twin-cylinder engines, I would be pleased to send him by number that I have received during the past two years.

W. H. WELLS.

Newcastle M.C. members assembled at Belsay, on the 17th inst., when a speed judging competition was held.

Belt v. Chain.

[3282.]—I little thought, when I was tempted to reply to one of your correspondents, who apparently had taken to heart the argument that "Ixion" and Mr. B. H. Davies had put forth that chain drive was essential for sidecar work, that the old question of belt and chain drive would be reopened. I am not by any means antagonistic to the chain drive, my principal reason in replying to your correspondent being that his letter could easily have been misinterpreted by readers desirous of fitting light passenger attachments and thinking they would only be investing in trouble, become disheartened, and finally refuse to entertain the idea, unless their purse would allow them to convert their cycles to chain drive as well. To my mind this seemed regrettable, especially as I look back and recall past memories of enjoyment obtained with a sidecar. In Mr. Davies's reply his arguments seem intended more for coachbuilt tricars, where naturally one would expect chain drive. Yet surely he does not place sidecars in the same class as 10 h.p. tricars—the one weighing under 4 cwts., the other anything over 3 cwts., and with water-cooled engine.

"Ixion" in his article asks why I do not enter the End-to-end run. Fortunately for my pocket, unfortunately for my pleasure, I am unable to leave business three weeks, otherwise I should be a starter, if not a finisher, so that I am obliged to enter competitions that do not clash with business to such an extent. I am aware that the London to Edinburgh run is over very easy roads, so much so that up to the present I believe no sidecar has got through, although four started last year, I being one of the failures. Again, whether hilly or flat, the distance is nearly half the total mileage of the End-to-end. Experience has taught me that it is when a belt gets excessively hot that it unduly stretches, and I admit, even in the Edinburgh run, I shall have one or more spare belts, and doubtless, whether necessary or not, use them both alternately, for precautionary measures alone, in the same way that a chain-drive competitor will have his chain spares.

Perhaps it would further interest "Ixion" and other readers to know that three years ago I was over a good part of the End-to-end course, driving a 3½ h.p. Minerva, single gear, belt drive, and sidecar. In fact, according to the officials, I was the first sidecarist to cross the Firth of Forth from Burntisland to Granton. My passenger on that occasion weighed thirteen stones. We left London *viâ* Oxford, through Gloucester and Herefordshire, up the West Coast, over Shap to Carlisle, getting beyond Killiecrankie, and returning *viâ* Edinburgh. Certainly I dropped my passenger now and again, and also myself on occasions, but we got there, and I had in use the two belts for some considerable time afterwards. In my opinion this goes to prove that those of my fellow motor cyclists who want light passenger attachments and cannot afford expensive vehicles need not be disheartened because of the necessary (?) chain drive conversion. There is a great deal of fun to be got out of the belt drive.

Finally, Mr. Davies expresses the view that on occasions he has hardly found it necessary to carry even a spare fastener. *Always* see there is one in your tool roll, whether riding solo or with passenger, is the advice of one who, even recently in 1908, pushed at night three miles in pouring rain with passenger aboard.

P. W. VINSEN.

[3283.]—I have been an interested reader of the letters and articles on this subject which have appeared in your unrivalled paper, but have not thought fit to express an opinion up to now, as I am certain to be thought biassed in favour of the belt drive. However, I am risking this awful fate by giving the experience of an old friend of mine, a well-known local rider.

This gentleman built one of the first motor cycles in Sheffield, some five or six years ago, when motor cycles were in the first stages of their evolution. For some reason best known to himself, he designed it so as to be driven by chain, with cone clutch on counter-shaft, and, so driven, the machine has done anything from 15,000 to 20,000 miles.

Some months ago my friend decided to build a new mount, and this he also made for chain drive, but before finishing it he decided to overhaul his old steed and dispose of it on the completion of the new one. For the sake of simplicity, and because he wanted the clutch for his new mount, my friend made his old one belt-driven, and here begins the significant part of the story. He purchased from me a belt I made when the Stratex was in the experimental stage, rode his old converted machine for a time, and the other day came to make enquiries about a belt for his new mount, which he had

been making as a chain drive. In fact, he had purchased a chain for that purpose. The increased comfort, simplicity, and silence of the belt drive had converted a chain drive devotee of five years' experience.

I once had the misfortune to be a passenger in a side-car attached to a chain-driven machine, which was competing in a slow race. The machine was fitted with a so-called slipping clutch, but this did not prevent me from having such an awful time that, at the conclusion of the trial, I could scarcely believe there was a sound tube in the machine. It speaks well for the make of the frame, etc., that it could stand such a succession of heavy jerks. To a certain extent this takes place on all chain-driven motor cycles when starting off or running slow, and even at high speeds there is a certain amount of vibration and noise from the chains which is absent from a belt drive.

As to the superiority of the chain for passenger work, you cannot expect a belt which has originally been intended to pull a single rider and machine weighing, say, 22 stones, to perform the same for two people and the extra weight of sidecar, or other attachment. Get a good belt, get it big enough for its work, see that it is properly fitted, and there is no reason why a belt drive should not be as efficient (it is certain to be more comfortable) as a chain drive.

W. H. BERISFORD.

Sidecars.

[3284.]—I have already expressed the opinion in your columns that all sidecars have their good points; and while one must expect that some manufacturers may indulge in what is usually described as "puffing," I think it should be understood that, because certain good features are claimed for a particular type of sidecar, it does not follow that other types do not also possess such features, and possibly others as well. For example, it is hardly fair to say that one type of sidecar will wear twice as long as any other attachment, especially when the type for which the claim is made has several working joints.

I think, too, it has never yet been authoritatively demonstrated that a certain type can be driven faster and with greater safety than any other type.

It is objected that, say, the rigid type of sidecar cannot be ridden straight off by a bicyclist, and the contention is made that there is, therefore, something radically wrong with the attachment; but this is equivalent to saying that a tricycle is radically wrong in itself—a statement that would be very difficult to substantiate.

With all sidecars approximately half the weight of the passenger is applied to one side of the bicycle, and it may be true that if the rider relaxes his vigilance the weight will instantly destroy the balance of the bicycle and pull it over, but this cannot happen with rigid and similar sidecars.

So far as I know, it has never been demonstrated that one type of sidecar takes more power to pull than another; a test carried out with a bicycle, to which various types of sidecars were attached in turn, would be interesting.

Most patterns of sidecars are nowadays capable of being attached to either the right or left side of the bicycle. All sidecars impose some strain on the bicycle frame, as it is at least partly through the frame that the motion is transmitted to the sidecar; but there are few, if any, motor bicycle frames that are not equal to this strain.

No prominent pattern of sidecar is likely to turn over at corners with a passenger on board, and the danger of overturning without a passenger is very easily overcome. All sidecars can be ridden *solus*, but only those of the rigid and similar types are adapted to be driven from the seat with the saddle empty. Various other advantages belong to one type of sidecar as to another.

There are other points I should like to deal with, but this letter is already too long, and I would only add that it is as well to hear all sides before arriving at a decision.

Perhaps I ought to repeat that I am interested in the castor wheel sidecar. DOUGLAS LEECHMAN.

Coil Consumption.

[3285.]—I notice with interest Mr. Roe's article in your issue of March 11th, comparing the consumption of various coils, and as current economy with its many advantages cannot fail to be a subject near to the hearts of both our colonial and home motor cyclists, possibly my own experience may be of interest to such of your readers as have still a leaning towards coil and accumulator ignition.

Mr. Roe's figures in the comparison of the Voltoo two-volt coil with the other makes mentioned cannot but be regarded as remarkable. "Seven times more economical" *(sic)* is indeed a remark to arouse the sniffs of "unbelieving Thomases," of which incredulous fellowship I feel bound to admit I found myself a member when some correspondence passed in your columns a few months ago relative to the remarkable performance of the above coil. Appropriate proverbs anent "pints from quart bottles" seemed to fit the circumstances admirably, until in a rash moment I indulged my curiosity and purchased a Voltoo coil.

I appended some figures determined by aid of our workshop ammeters and speed counters, at Messrs. Benson's (the accuracy of which is beyond reproach), after which it would be superfluous to add that my name is no longer "Thomas."

The engine on which the tests were conducted was a F.N. 2¾ h.p. (70 × 80), with a two-volt accumulator of twelve a.h. capacity. My contact breaker of the ordinary F.N. type has an effective "make" of over one-third of a revolution. Under this condition, which is, of course, quite unsuited to economy, I was surprised to note that the ammeter registered less than one-fifth on two volts, which figure on a four volt circuit represents in equivalent voltage the astonishing fraction of one-tenth, or less. How much less I am not prepared to say, as with the former reading the minimum of the instrument was reached.

In order now to test the capacity of the coil to fire at high speeds, the counter was brought into operation and the engine run to its utmost limits. Three tests were taken in making known the figures, of which I am aware that I am courting odious comparisons with one, Washington; still, here they are (correct to within 20)—3,200, 3,300, 3,350 revolutions per minute.

I need scarcely say in this connection that I shall be most happy to ocularly convince anyone who cares to write me on the subject, and at this point would seek to assure readers that my object in rushing into print is devoid of the slightest interest in, or commercial connection with, any make whatever of either coil or engine, but is solely out of compassion for those unfortunate possessors of current-eating, platinum-pitting coils, who dare not venture far without two bulky accumulators, while I can count on 100 miles, approximately, for each ampère hour capacity of my single small battery, and that by using only one side *(i.e.*, bridge to one terminal) while keeping the other side as a spare.

The spark obtained thereby is better than that of any four volt coil I have yet seen, being of a fine flaming variety and a good half-inch long.

May I, in conclusion, say a word which will appeal to Mr. Roe and others, who are forced to practise extreme economy on account of the difficulties of charging and renewing? If the engine is moderately well tuned as to the carburette, etc., with a good plug and well trimmed points, a single dry cell will fire it admirably with this coil. I hesitate to give the consumption a figure, as I have failed to move any of the ammeters from 0 when in series with this current with the engine running, but Mr. Roe may rest assured that it is not great, and, only that I have ample facility for charging accumulators here, I should certainly carry two dry cells, use them each separately for a few months, then both in series, which plan is most successfully followed by several motoring friends of mine. A. J. LEAVER.

Novel Police Trap near Canterbury.

[3286.]—A friend of mine has just informed me that he was stopped returning from Margate on Easter Monday by two police officers in uniform. He was then told his number and time had been noted by one of their men five miles distant, and his arrival time was noted by the uniformed men. The time is to be worked out, and if he has exceeded the limit he will be prosecuted; if not no further notice will be taken. Surely, this is the latest move in the persecution of motorists. LATEST.

NEXT WEEK.

THE MOTOR CYCLE Special Spring Number

ORDER IT NOW.

MOTOR BICYCLES FOR SALE.

REX, 3⅜ h.p., speedy, reliable; £15.—123, Burges Road, East Ham.

WANTED, part or whole second-hand gear, for 5½ h.p. Oldsmobile, cheap, in good condition. — Green, The Ham, Brentford.

WANTED, for cash, new 2 h.p. engine, with carburetter and silencer, also large brazing lamp.—Hodgson and Co., Abergavenny.

WANTED, good twin engine, also carburetter, silencers, belt, saddle, tyres, and any other parts, for motor cycle. — J. Neighbour, Walworth Road, S.E.

'Tee Bee' or not to be.

PRACTICAL MOTORISTS ALL SAY

'TEE BEE'

'Tee Bee' Spring Seat Pillar suits machines with fixed seat pillars, Price 12/6

"Tee Bee" Stand, strong, rigid, easily operated, Price 12/6

'Tee Bee' Steel Footrests, Price .. 5/-

'Tee Bee' Carrier. Tubular, 10/6, Strong metal, 6/6.

'Tee Bee' Spring Footrests, Price, 12/6.

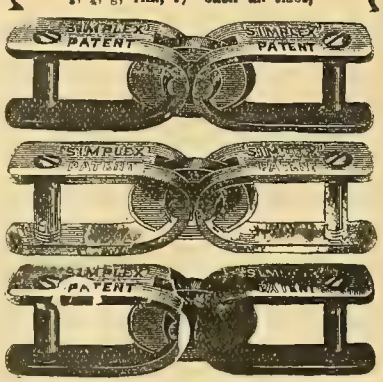
Can be had through Cycle and Motor Dealers everywhere. Booklet free.

TEMPLETON BROS.,

535, Sauchiehall Street, Glasgow.

"SIMPLEX" PATENT Belt Fasteners.

¼, ⅜, ⅞, 1in., 1/- each all sizes,



BEWARE OF COLOURABLE IMITATIONS.

Sole Patentees and Manufacturers,

HERWIN, CANNY & Co., PLUMSTEAD, S.E.

WANTED.

FIT-ALL or other two-speed gear, cheap. —254, Barking Road, East Ham.

WANTED, Triumphs, Rocs, Rex de Luxes, F.N. lightweights, N.S.U.'s; cash waiting.—Halifax Motor Exchange, Westgate, Halifax.

WANTED, 1906 Rex, single or twin, any condition, or repair if cheap; full particulars; rock bottom.—26, Caunce Street, Blackpool.

INCLINED Engine, 2½ h.p. or over, part exchange 2 h.p. Minerva, or sell. — Freeman, Sterndale House, Queen's Road, Beeston, Notts.

WANTED, good twin-cylinder engine, in exchange for lady-back two-speed tandem, or sell £8.—Drummond, 20, Tylney Road, Forest Gate.

WORKING Partner, with about £500, for improved motor cycle manufacturing business.—No. 9,754, *The Motor Cycle* Offices, Coventry.

WANTED, engine, 3½-4½ h.p., good condition, good make, must be cheap; approval; cash waiting.—Cockerill, 213, Harvist Road, Kilburn.

WANTED, motor cycle, in first-class running order, cheap for cash.—Particulars to Steward, Conservative Club, Ogmore Vale, Glam.

TRICAR, three-seater, Riley, Rexette, or other renowned make; exchange Quadrant carette and cash.—9,746, *The Motor Cycle* Offices, Coventry.

TWO Motor Cycles.—Cash waiting for good machines, if cheap; send specification, or call. — 108, Bennerley Road, Wandsworth Common.

HORNER'S Rex Agency.—Motor cycles, all makes, exchanged, purchased for cash, or sold on commission. — Store Street, W.C. Tel. 13456 Central.

TURBINAMO, cheap, or would exchange pair Lohmann's Perfecta lamps, new, suit tricar or small car.—Captain Blockley, Wellington, Shropshire.

WANTED, light, low, up-to-date spray motor cycle; exchange Zonophone and records and cash.—Haward, Eldon Lodge, Hewlet Road, Cheltenham.

WANTED, good modern cycle, 3½ h.p., or over, with sidecar, or separate; must be perfect, and cheap for cash.—J., 34, Howbury Road, Nunhead, London.

WANTED, Clyde or Simms 2¾ h.p. engine, with low tension magneto; state condition and lowest price.—Box No. 9,758, *The Motor Cycle* Offices, Coventry.

REX De Luxe Wanted, 5 h.p., twin, 1907 or 1908, with or without clutch and two-speed.—Full particulars and price, H. Dennis, 77, Wigmore Street, London, W.

WANTED, a purchaser, for a 3½ h.p. 1907 Quadrant, as good as new, with about £5 worth of spares; seen any time.—294, Queen's Road, Peckham, S.E.

WANTED, Tricar (not heavy), about 4-6 h.p., water-cooled, three-speed gear, open frame preferred; must be recent make.—73, Church Street, Camberwell.

WANTED, thoroughly reliable, free engine cycle, 3 h.p. upwards, Beeston Humber preferred; no rubbish.—Exhaustive particulars to Milner, Wormit, Fifeshire.

WANTED, forecar attachment, complete, 26in. wheels, brakes, long side stays; cheap for cash; full particulars.—Tickett, 33, Queen's Road, Southend-on-Sea.

WANTED, 9 h.p. tricar, thoroughly sound; exchange 6 h.p. Quadrant Carette, 3½ h.p. Minerva bike, in good order, and cash.—Walker, Victoria Buildings, Worksop.

CYCLE Agents should read "The Cycle and Motor Trades' Review," the leading trade organ; specimen copy will be sent on receipt of trade card.—Address, "The Cycle and Motor Trades' Review" Offices, Coventry.

MOTOR Bicycle wanted, 3½ h.p., or over, 1907 or 1908; exchange sailing boat, fast, suitable for motor, 10ft. long; mahogany and oak, new last May, cutter rig, centre boards, seats six.—G. Dennis, 77, Wigmore Street, London, W.

THE TROUBLES OF A NOVICE.

By S.B.S.

N company with a good many other motor cyclists, I graduated from two wheels to three during last summer, and my first three-wheeler was a second-hand 5½ h.p. two-speeder of uncertain age, and, this account will show, of more than uncertain nper. It had been in my possession for some weeks fore I was able to get a decent run on it, but at st opportunity came for a ride to Chester, and in mpany with a friend known to his intimates as Pop," who rode a 2¾ h.p. Excelsior, I left rthampton at 6 o'clock one fine morning.

Fate's ironies were manifest at the very outset. We re actually ready to start at 5 a.m., but as a few xious relatives and friends thoughtfully desired to sh us good-bye we delayed our start till their arrival, hich was at 6 a.m. "What is an hour more or less," oth "Pop," "when you travel by motor?" The quel replied that an hour more or less was of small count indeed, for half an hour after noon we were lt forty miles away, having maintained the noble erage of 7.58 miles an hour. First the petrol pipe oke, and laid the dust at a cost of 1s. 4d. per square d. Then an awful rasp from the gear box saluted r ears, and it jammed up hopelessly, causing the ked back wheel to skid the machine across the road a most alarming fashion.

This was rather a test for a novice, but we filed an ra notch in the gear quadrant, and when the lever s in this third notch the top gear was well jammed and the pinions would revolve. By the way, that ch took two solid hours to cut. Then the camshaft the bicycle broke clean in half.

The tricar towed the bicycle till the gear box jammed once more, and "Pop" came an unholy cropper off the saddle in consequence of an abrupt stop. Waggling the gear lever freed the gears. We reached a garage, made a new camshaft for the bicycle, and went on.

We Finally Resorted to Towing.

Then the tricar gears seized again, and it was the bicycle's turn to tow the tricar, luggage and all, into Tamworth. Here we took the entire tricar to pieces, and cleared the broken parts out of the gear box (four hours' work for three men). By this time it was 10.30 p.m., and we had our first meal since 5.30 a.m. —a meal as famous in the annals of that hotel as the breakfast with which the waiter assisted David Copperfield was famous in the annals of another inn. We found the tricar gear box required several new parts, and early next day we loaded both of ourselves on to the Excelsior, and went over to Coventry for them. Seven miles out from Tamworth a storm came on, and, lest we should timidly seek shelter, the back tyre promptly burst! We had no solution, but we had an ancient butt-ended tube. For hours we laboured to make it airtight, but never induced it to bear the weight of two of us. Finally, "Pop" went on to Coventry solus for the spares, while I set out to walk back seven miles to Tamworth, being assisted by a lift from a passing car for part of the way.

At 9.30 next morning work was resumed on the tricar. The mainshaft was wrenched away from the flywheel, and all the pinions were either burred or stripped. We laboured till 11.10 p.m., with only

The Troubles of a Novice.—

n hour off for lunch at mid-day, and at that hour was pronounced ready for the road.

Troubles Innumerable were our lot.

At 8.30 next morning we tackled the remaining eighty miles which still separated us from Chester. At 8.35 the back tyre of the bicycle burst again. "Pop" walked back and bought a new tube, so that by 9.30 we were really off. The tricar control puzzled me not a little, for the more I advanced the spark the slower it went. This was finally traced to an inverted connection to the spark lever, and as soon remedied. It then refused to climb any hills—then the silencer fell off, and before we had made any headway it was half past one. The adjustments which here delayed us were so successful that the next section was covered in flying style; but, unfortunately, we had taken a wrong turn, and each of these speedy miles spelt so far out of our true course. We got right, and passed through Lichfield and Rugeley, reaching Sandon by 3 p.m., where a long stop for overheating held us up, and incidentally afforded a chance for a meal. All through this nightmare of a ride I never dared stop while the engine kept running, for only heaven knew whether if once stopped it would ever start again. This caution was confirmed at Stone; as we entered the town, the church clock registered 4.45, and ere we got the engine going again after a distinctly involuntary stop, it registered 6.45. At last it suddenly started, rushed 300 yards, and stopped again dead, what time the cheering of the crowd was still audible in the rear. However, it now revealed the trouble. The collar had split off the inlet pipe where it joined the engine; the nut hid the damage, and so I had been unaware I was getting pure air into the cylinder. A length of inner tube plus some copper wire fixed this up, and the tricar maintained a glorious dash—wrong road again. We drove painfully back to Stone. Driving fast after this delay melted the improvised inlet union just at the bottom of a terrific hill. It was pitch dark, we were worn out, had scarcely tasted food, and had still forty miles to go, while we knew our expectant relatives at Chester would be consumed with anxiety. We got the union hitched up again, and had a fine run at high speed for miles till the road petered out in a ploughed field—lost again. We retraced our steps, and presently came to three road ends destitute of signposts; however, a sleepy rustic directed us. A lot of climbing faced us, and the tricar engine got red hot. Then came a long down grade down which I coasted with the engine switched off. Switching on at the foot of the next long rise, the engine refused to fire. Investigation proved that this time the petrol pipe had come adrift, and not a drop of spirit was left. It was now 10 p.m., and though I had travelled many miles, only ten of them were in the right direction. "Pop" was missing—heaven knew where. I had no map, no idea where I was, no sign of a house or a human being, and the tricar was stolidly immovable!

A New Method of Control.

Suddenly over the hedge came a voice, "Can I help you?" I surlily ridiculed the idea, but for once luck was in. The voice belonged to a motorist, who had petrol close at hand—nay, more, he was an experienced owner of a duplicate tricar the very spit of my own. He played the part of an angel—fed us, mended my pipe, and gave us petrol, for "Pop" ha by now reappeared. There were thirty miles to g and both my petrol pipe and inlet pipe were secure with copper wire and indiarubber, but the knowledg of our relatives' natural anxiety gave us heart to pus on into the night. In five miles the inlet pipe wa adrift, and was again mended with aid from a gam keeper, a signalman, and a policeman—jolly cheerin to find a crowd collect in the wee sma' hours, howeve unwelcome they are in broad daylight. Then it bega to freeze; then the carburetter began to fall off eve five miles, as it had sheared the nut at the other en and was only held to the engine by a bit of hose pip Every five miles I tied it on again with string, a *held* it while I drove. On I flitted through the cobb and darksome night, crouched low over the whe steering with one hand, holding the carburetter on wi the other, and slowing down when necessary by t simple expedient of dropping the carburetter—a fo of control that ensures quick stoppages in a emergency!

In Tarporley my engine seized up, red hot, and fell asleep in the bucket seat while waiting for it cool. "Pop" fell asleep standing up beside n both of us bang in the middle of the road. At 3 a. I woke, and started the engine. Now the bicy refused to go, but finally after much dreamy wrestli in an agony of thick darkness we both got away, a our next stop was outside the front door which was destination. 130 miles in four days!

A Gorgeous Non-stop of Fifty Miles.

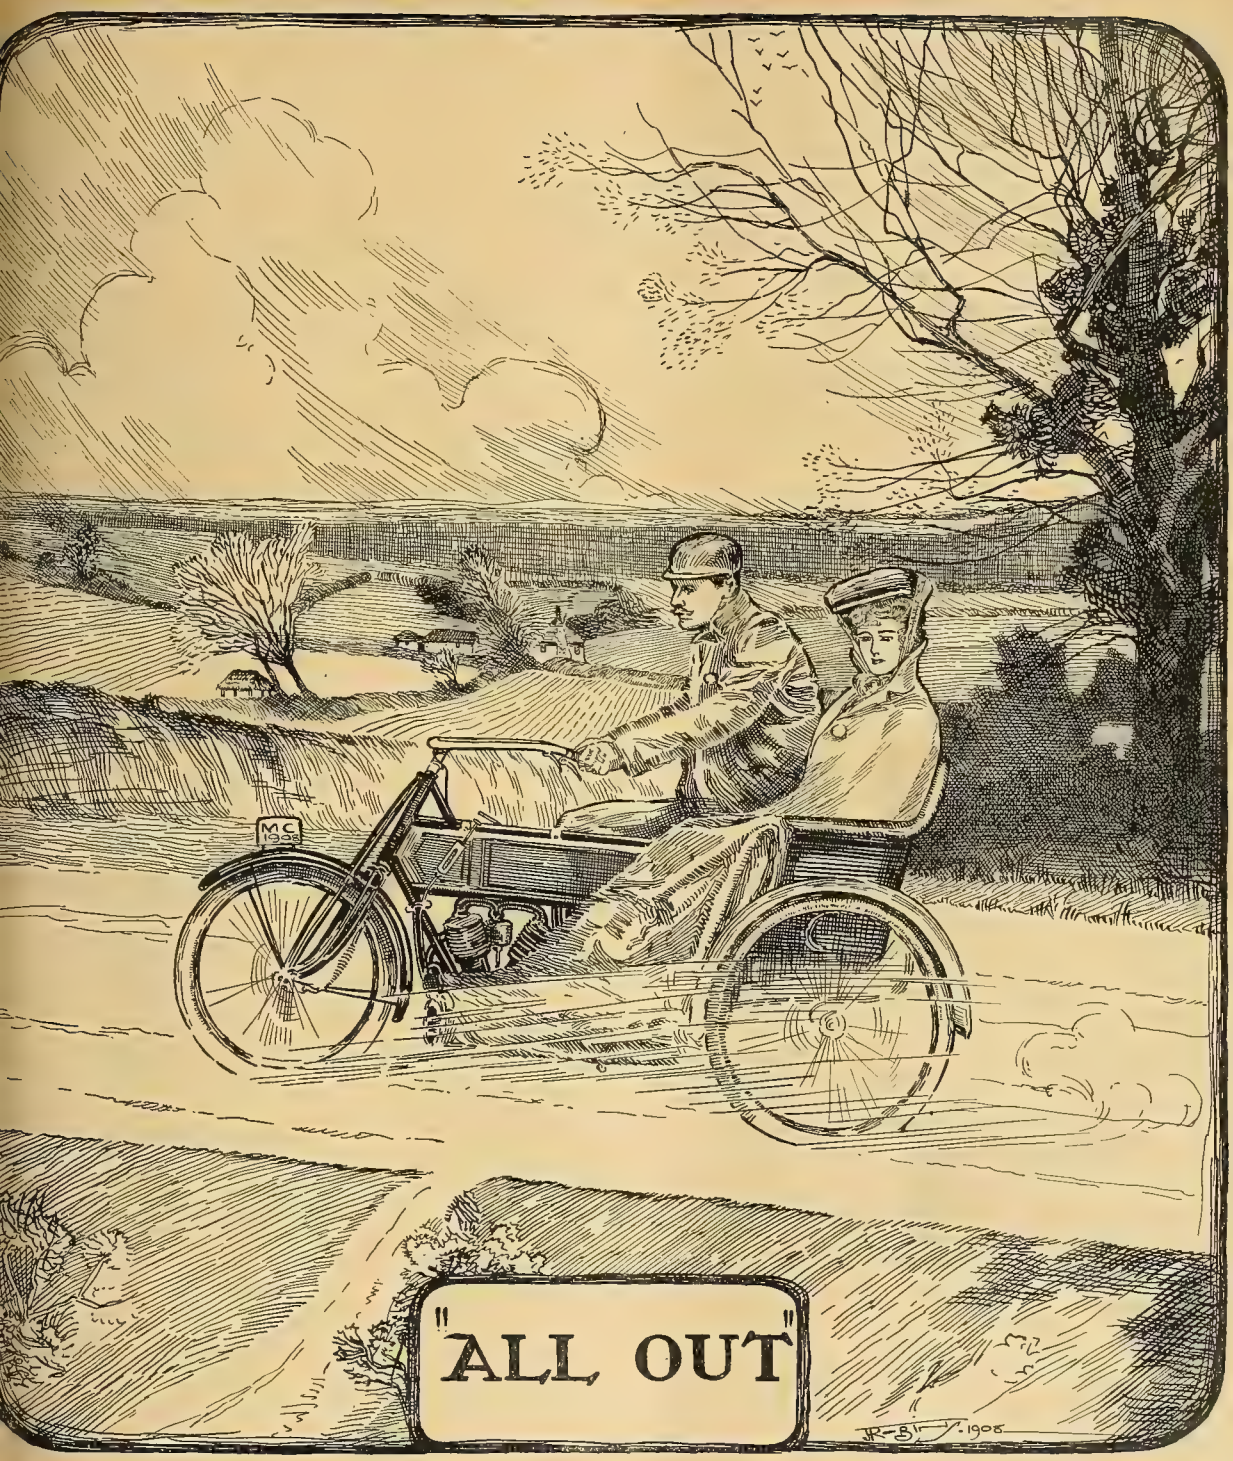
When we had recovered from our exertions we tu up both machines, and a day or two later had a uni gorgeous non-stop of fifty miles apiece. The n night, encouraged by this, be motored to the theatre Birkenhead. When we came out of the theatre neit machine would start. Towards midnight not a solit explosion rewarded our efforts, so we hired a brace bicycles. Some evil fiend was in attendance upon for even those bicycles possessed free-wheels uphill fixed wheels downhill, so we walked much of the back.

Next day we returned to Birkenhead by train, spent the day in vain efforts to make the machine st just catching the last train home at night.

The day after we put new piston rings on the tri and it started—why, I do not profess to know. bicycle still refused to go, so we returned to Che on the tricar, thence back to Northampton by tr

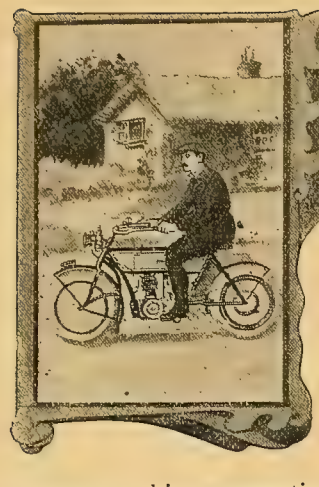
Such mockery greeted us here at our failure to m to Chester and back in the inside of a fortnight we determined we would eventually bring those recalcitrant machines back by road. We chose day, and attempted it. The bicycle had meant been put in running order by a repairer, and "Po drove it from Birkenhead to pick me up at Ches and, including stops, we actually coaxed those motors over the 130 miles in less than twelve hours the amazement of everyone who know them. (D hear a voice say, "Us?")

This tale has a moral: Let not the gentle tyro chase a second-hand tricar without an expert exam tion. And I will conclude with an invitation: If gentleman has a regular wreck of a prehistoric tr which he desires to see coaxed through the End-to- I believe I could get it through, if any man li could.



uld you like to go a-touring in a manner most alluring,
Here and there,
employ your well-earned leisure in obtaining health and pleasure
Everywhere?
uld you care to go a-flitting, on your saddle calmly sitting
At your ease,
ough the lively crowded highways or the lovely leafy byways
As you please?
uld you like to ride serenely, and enjoy the motion keenly
Of your steed,
r hills and crests and ridges, under aqueducts and bridges
At full speed?

If you would, try motor biking; 'twill be greatly to your liking.
'Twill indeed!
. . . . . .
There's no sport that's more beguiling when the sun is softly smiling,
Or ablaze,
For its joys are keen and many, and within the reach of any
Nowadays.
Therefore, if you've never tried it, buy a motor bike and ride it,
We advise,
And your voice you'll soon be raising, and the pastime loudly praising
To the skies.
(A word is quite sufficient to the wise.)



Our Historic Highways.

By REGINALD WELLBYE.

WITHOUT roads—roads, that is, in the modern sense, hard, smooth highways—motor cycling, or, indeed, any kind of cycling or motoring, would be all but impossible. Roads, in fact, are every whit as essential to the practice of the pastime as the vehicle itself, and the subject is therefore of more than passing interest to motor cyclists, even were it a dull one. But dull it most certainly is not, for our highways are in every sense historic, and the rider who to-day so easily mows down the miles along them is moving among associations as rich and as stirring as those which he meets at palace and castle and church. To a generation that knows no other highway but the railway and no travelling carriage but the train, the road seems a thing of small importance—a mere convenience for the tradesman's cart and the farmer's waggon, just a track to connect the town with the scattered hamlets and the solitary houses that lie around. But it was not that the butcher of Dulby might reach Slowcombe, that the farmer of Slowcombe might take his grain to Waterham, that Waterham's miller might sell his flour at Fairborough, or that the lawyer of Fairborough might jog smoothly along to the assizes at Oldchester, that the great roads of England grew up.

For Whom were the Roads Constructed?

The Dulbys, the Slowcombes, the Waterhams, the Fairboroughs, the Oldchesters, and the rest of them are all usurpers. Barely seventy years ago they were mere incidents by the way, and the farmers and the butchers, the millers and the lawyers, who have lorded it so long that they dispute the very right of a traveller from a distance to use the road at all, were then but very small fry indeed. For then, and as it had been for nearly two thousand years, it was the great roads that were the only means of communication from one end of the country to the other—the very nerves and arteries of Britain. The lanes and byways, upon which not a tithe of the trouble has been bestowed as was devoted to the main roads, were, of course, always sacred to local traffic, and when the generation that could remember the busy roadfaring days had died out and when Turnpike Trusts themselves had expired, the prime difference between highways and byways was forgotten, and all roads became byways. The motor cyclist, with the means at his command of transporting himself from one side of the island to the other within the span of a single day, is unconsciously reaffirming the difference, and is rediscovering the old trunk coaching and posting routes abandoned nearly threequarters of a century ago.

New roads have come into existence at most periods, but the majority of highways are very old, the oldest, indeed, vying in age with the most ancient monuments of man in these islands. They were not made, they grew—just as footpaths will grow up to-day acro newly-opened estates. The old roads were, in fact, b footpaths and horse paths that sprang up automatical as the early barbarian inhabitants of primeval Brita made their way across the land over what seemed t easiest ground, and so wore out a beaten track ov down, and through forest, a few feet wide only, whe the soil was firm, but broadening out at soft or bog places into a number of twisting, undefined trac for roadmaking and roadmending were almost unknov arts, nor were they much practised till modern tim Thus did roads come into being two thousand yea ago, and wherever the Saxon planted a village, t Norman a castle or a monastery, the same process to place, as it nearly always did when people required travel in new directions. It was the Roman alone w *made* roads, caused them to be deliberately plann and scientifically constructed—that is, in cont distinction to allowing them merely to grow spontaneously, and pitching down some stones or few pieces of wood when they threatened to beco impassable, which was practically all the attenti highways ever got in the middle ages.

The Romans as Road Makers.

The Romans straightened out such of the old rou as they needed, and laid out others to connect th new camps and colonies. An important Roman ro was a marvellous piece of work. Built up of pounc tile and cement or other hard material, often to seve layers, and surfaced with gravel or flagstones, stood out, a low embankment, some feet above t level of the soil.

A few much weathered lines of bank, and, ra still, vestiges of pavement, still linger here and the but in such rough places that the motor cyclist v not look for them. But though the roadways h mostly gone, the straight lines in which they were l out remain in abundance, for if many Roman ro went over ground where only a Roman would want go, and so fell out of use in after times, a great m were never abandoned. The man who rides from Marble Arch, in London, to Weedon, Northampt shire, hardly for a single mile leaves ground trod by Roman feet, and similarly the straight lengths the roads from Ware to Stilton, and from Linc northwards to the Humber, or Leeming Lane, in Yo shire, and Stone Street and Watling Street, in K betray their imperial builders. Dreary some of th are to the slow-coach who crawls over them inch inch, but to the motor cyclist, who can gulp them do in miles at a time, they are never unwelcome.

ır Historic Highways.—

Such roads are crowded with memories of the old nperial days, when the Romans were masters of the orld and Latin was the speech of Britain. Over iem has passed many a cohort and many an ala of ie invincible Roman army, and such commanders as ulus Plautius, Agricola, and Theodosius have been orne over their even surfaces. Even wearers of the urple were no strangers, the shades of Claudius, Iadrian, and Severus flitting up and down the long nes of Watling Street and Ermine Street and other raight drawn ways.

But a Roman road which is still a highway and ot a ruin has other memories than these, and they are

A Bath Road scene.

emories, too, that cling to other great ways—the roads hich radiate from London to Exeter, to Bristol, to loucester, to Norwich, as well as the well-worn pro-ncial routes from shire to shire. They are haunted, l of them, by a motley crowd—Saxon, Dane, Norman id Englishman, monk, priest, king and noble, erchant and packman, clerk, and burgess and soldier.

The Traffic of By-gone Days.

Muse on such an ancient highway, and one may see lfred, marching at the head of his Saxon levies to eet and vanquish the heathen Danes, or if it is not lfred who treads that particular road, it may be ecket or Wolsey, travelling in such state as befits rinces of the Church; Simon de Montfort, or the oughtful, observant Chaucer returning from Flanders ong the Dover Road, or Richard Crookback riding ut from the Blue Boar at Leicester to his fate at osworth; James I. dawdling down the northern road his English throne, or Jeffries of execrable memory, or Butcher Cumberland, or, indeed, it may be anyone whose name is known in English history, for they all travelled, and travelled often, and the road—the self-same road we hie along in very different fashion to-day—was the only highway.

If the roads are for the most part such as they grew up centuries ago, in appearance and in other respects they owe much to later times. About two hundred years ago their condition was appallingly primitive, and, through the great growth of traffic, and particularly of wheeled vehicles, were probably infinitely worse than they had been in much ruder times. Many of them were only narrow causeways of bumpy stone blocks, just wide enough for horses and pedestrians, surrounded on either side by the natural surface, cut up, uneven, and dusty in summer, quagmires, literally feet deep with slimy mud, in winter. The Norwich road near Wymondham and the Northampton road between Hockliffe and Woburn, for example, were in that condition a hundred and sixty to two hundred years back. Where there was no paved causeway the road was simply made up of stones and mud, and the mending chiefly consisted in adding a few more stones and piling the material up into a steep bank, when it had worn into ruts more than a foot or two deep. Even the worst of modern lanes are good by comparison, and it seems difficult to imagine, say, the speedy Bath Road as ever in so impassable a state, yet that certainly was more or less the condition of English main roads so late as the reign of George II., except within fifty or a hundred miles round London, where they were often better.

(To be continued.)

WHAT IT FEELS LIKE TO BE AN EXPERT.

By S. W. O. LEN HEAD, M.I.C.E., Etc., Etc.

THE best laid plans of M.I.C.E.'s and other men gang aft agley, and, though I have been conscious these many years of the fact that I am a motor cycle expert, I little expected ever to be commanded by an editor to blow my own hooter in public, though I did once get fined a fiver at Esher for *not* blowing it. What does it feel like to be an expert? I imagine the callow novice supposes us (I will grant for the moment there may conceivably be others besides me)—supposes us, I say—to enjoy unbroken peace and a pleasant sense of mastery when we disport ourselves upon the capricious motor bicycle. Peace I certainly never know. Every post brings me epistles similar to the one faithfully copied below:

"Respeckted sir,—Having purrchased a 1¼ hor. pow. minerva, it bangs mostly in the wrong sillinder. The sillinder it bangs most in is the tin one with holes round it, which falls off evvry now and then. The iron sillinder with gills round it bangs verry infrequent. Being a working man with a large family, I applies to you, and shall be extrornary grateful for your imedat. reply. "Yours respectively,

"——."

Quite a small treatise had to be written in response to this, and was gladly written. But one has less patience with portentously long letters from well-to-do and educated people, enclosing no stamps for a reply, and least patience of all, perhaps, with the correspondent who sends an ideal specification, to which is appended a string of eighteen definite questions; you treat him courteously, and a week later, having digested your strictures, he forwards a new and much longer specification, tagged to which are thirty-six questions. You curtly denounce this new and weighty monstrosity, which probably has eight cylinders, four ignitions, and thirty-two sparking plugs.

A Beautiful Blue Print of a 5 h.p. Twin.

He then flies to the other extreme, and sends you a beautiful blue print of a 5 h.p. twin to scale 63 lbs. all on, and demands where he can obtain an engine for it. Finally, he writes to say he has decided not to go in for motoring until he can afford a 60 h.p. Mercédès. Your holiday tour then takes you into his vicinity, and you ask an acquaintance who this freak may happen to be. Your friend points you out to him—a pupil at the local boarding school, with an exaggerated rump protruding from beneath an Eton jacket—and you realise with curses that he has been beguiling the weary hours of prep. at your expense.

Then there is the correspondent who knows too much. He opens by informing you that he is rather an expert rider, but has at last met his Waterloo. He describes with every appearance of veracity how i trying to cure a misfire he has made every conceivab test—new coil, accumulators, contact breaker, plu wiring, etc. The local repairers have broken the hearts over it, but, considering me to be the Wort Beaumont of motor cycling, he relies on me to resto his departed sleep to him. I sit up two nights, ar evolve magnificent theories of ingeniously intrica causes of misfiring. He bombards me with letter which grow less and less courteous, every two day Finally, there comes a curt postcard to say that wh he tried a new plug he incautiously used an outca from his brother's De Dion car, and that this was t sole cause of his trouble.

Ah, says the novice, but when you experts get on t road! That is when you make good. The practis glance your trained eye casts over the machine in th instant while you are poised in mid-air between grou and saddle infallibly marks down each tiny m adjustment. You never know what it is to cast t wistful glance of immeasurable despair down a coun road untenanted for a mile this way and also th You never know what it is to feel runnels of ma sweat trickling down between your shoulders, droppi from your manly brow into the air vent and diluti the petrol what time you push your heavy tv up some unbelievably lengthy ascent. You aver forty miles an hour, and never pause except for drir or to play the good Samaritan to some unfortun novice in distress.

The Expert's Old Man of the Sea.

Pardon me. The expert's main business is to t every novel device ever invented by the crack-brai fugitives from our lunatic asylums. These devi consist of many things—new tyres, new brakes, r spring forks, new free engines, new carburetters, r ignitions, and new two-speed gears. Inventors v in the degree of their lunacy, but one thing is comn to them all, and that is poverty. No man w enough money to enjoy bread and butter seven day week ever trod the toilsome path of the mechani inventor. Consequently every new idea we ever h to test is mounted upon the most decrepit and rick crock of a motor bicycle that ever strewed a le road. Added to the unspeakable atrocities and v ness of the invention itself are the innumerable po bilities of trouble in the bicycle on which it is moun for test. My very worst experience of the sort was follows: An inventor produced a new free eng clutch, which looked admirable on paper, and w indeed, admirable in design, but oh! so indescriba badly made. It was enshrined in the rear hub.

at It Feels Like to be an Expert.—

s in an urgent hurry when I set out to test that free gine. Eighteen miles from anywhere it seized up, that the rear wheel would not revolve. It was in salad days as an expert, and, knowing the man s poor, I was loth to leave his only machine by e roadside. There was no shed to put it in, and could not be pushed, for the rear wheel was immov-le. Gentle reader, I *carried* that motor bicycle ee miles to a barn.

A Gear of Inadequate Strength.

Or two-speed gears!. No wonder I have a high fore-ad—I am bald with thought, and before I went bald vas grey, though like all real experts I am still in teens. Not so long ago I set out to test a new cyclic rear hub gear. As usual, thirty miles from destination there arose a creaking and a grinding, gnashing of teeth, that were not mine, for they were rrowed, and of steel. No other means of locomotion ng available, I dismantled that hub by the roadside. e final drive of that hub to the wheel itself was from pinion. That pinion was coupled to the wheel by ng mounted so that the edge of its teeth nicked into internally toothed ring. That internally toothed g was 3-32in. thick, and was riveted to the wheel eight footy little rivets about the thickness of a ke apiece. This strong and stable ring and rivets re designed to take the drive of a 6 h.p. engine, and nsmit it to a sidecar and 3ost. of human flesh. The g was about as strong as a crown piece with all cept the milling cut away; the rivets were about as ong as wax vestas. I like to encourage brains, but could not find one single good word to say of that ar, except that the case was stove enamelled. This s quite true—I would not deceive our readers for e world.

Another great enemy of ours is the amateur enthu-st who besieges you with invitations to dinner. After ny refusals you go once, intending to behave so dly that he will never ask you again. The dinner is od, but with four frightfully keen and awesomely norant riders bombarding you with deep mechanical oblems based on impossible data, you get no chance enjoy it. The ladies depart, voting you the dulliest d priggiest chap they ever encountered, which is noying, as you would like to have made a better pression on that little thing in the awfully fetching ue frock. The coffee and cigar stage is inordinately olonged, and before you can escape, you have to etch out on your shirt cuff the bowels of a differential ar and two or three different systems of magneto nition. At last there comes a reluctant departure to e drawing room. Joy—there is an empty chair by e little blue girl. You settle deep into it, and do *not* k motors. Up comes your host: "Now I know ttie'll excuse you, old man, but the fact is Robinson's st ridden over on his 1896 Werner, and, as it didn't t up Porlock Hill last time he was down West, he'd frightfully obliged if you'd just take his engine down for him. We should all learn something!" I learn something, too, next day—the exact price of a new dress suit.

The Maker who wants his Wares Boomed.

Then there is the maker who desires you to boom his goods. This is very nice for you if the goods are good—you do the public service, have a good time yourself, and help a deserving man to conquer the prejudices of an incredulous public. But the maker whose goods are really bad is another sworn enemy of mine. His line, perhaps, is belts. He sends you a belt. It breaks, slips, wears shiny, slips, etc., etc. He writes for a report. You reply that the belt covered 180 miles on a 3 h.p. before collapsing. His response is an indignant four folio letter, explaining that young Jones "went through the Edinburgh run on my belts." So young Jones did—he went through the belts, too (four of them), but it is inadvisable to say so. So the maker sends you a sample of his latest pattern. You hang that peacefully up in your stable till it grows mouldy—it comes in handily for chastising youthful trespassers on occasion. In the autumn the maker writes again. You reply, "I have used your belt for eight months, and it is as good as new." He publishes this in his advertisements, and all is peace between you.

Another of my foes is the small and struggling maker. He sends you an entire machine to test. You ride it once, and it is rotten bad. Presently he grows impatient. Why have you not dilated on its merits in the press? You respond by publishing an abridged specification, concluding with one or two mildly defamatory remarks. He writes to say your critique is not enthusiastic enough to please him. You reply that naturally it is not, for it is true. And then he suborns urchins to sprinkle the roadway around your front door with tin tacks.

No! The poor expert enjoys few moments of his motor cycling existence. His real joy comes late in the season. He has tested the numberless atrocities various makers have forwarded, and his season's work is over. He has snatched time for a brief tour on his good old Triumph or Vindec or what not, and is travelling incog. in the fastnesses of Devon or Scotland. He has done his 200 miles non-stop since breakfast, and is lolling, with an ancient briar, in the lounge of a decent hotel, while a couple of young and verdant motor cyclists are regaling him with the marvellous performances of their own mounts, and telling him what an uninstructed juggins he is to ride the particular make he does.

The Percy Cycle Co., Ltd., 56, Northumberland reet, Newcastle-on-Tyne, send us a copy of their talogue of motor cycle accessories. In addition to ing sole factors in the North of England for N.S.U. otor cycles, they are sole agents for Triumph motor cycles and Riley tricars. The list sent comprises acetylene lamps, belts, fasteners, horns, goggles, stands, and carriers, and the N.S.U. two-speed gear and free engine. Also the Mabon free engine clutch and the Advance adjustable pulley.

Being the opinions of medical men who are actual users of motor bicycles or tricars.

So many doctors are motor cyclists, and partly to refute the statements one occasionally hears that motor cycling does not promote health, we asked medical readers of *The Motor Cycle* to be good enough to give terse answers to the four following questions:

(1) Your opinion of motor cycling as a healthy pastime.
(2) The utility of the motor cycle in your professional duties.
(3) The cost of motor cycling compared with any other method of locomotion of which you may have experience.
(4) Your opinion of the most suitable type of motor cycle for doctors' use.

The replies printed below should prove once for all the outstanding advantages of the motor cycle, not only from a pleasure but a health point of view. We take this opportunity of publicly thanking medical readers who have co-operated in this feature. Addresses have been withheld for obvious reasons.

Cunningham, M.B.

(1.) I consider motor cycling a healthy pastime. (2.) It is decidedly useful to me in my professional duties. (3.) Its cost is less than any other method of locomotion, with the exception of the push bicycle, which is a very poor locomotive when going uphill. (4.) In my opinion two types of motor bicycle are suitable for a doctor—either a lightweight machine or a heavyweight with free engine and two-speed gear.

D. V. Haig, M.D.

I consider motor cycling a most healthy and invigorating pastime, without any drawbacks from the hygienic point of view. I find my motor bicycle very useful in professional work, except in really bad weather, and the cost is less than that of any other method of locomotion except walking and pedal cycling. My machine (3½ h.p. Triumph) is reliable, comfortable, and perfectly easy to manage in traffic, but my ideal mount would have a light and reliable two-speed and free engine gear.

R. W. H. Meredith.

Motor cycling is undoubtedly a very healthy pastime, enabling those whose occupation is sedentary to get plenty of fresh air and varied scenery in a short time. It is certainly helpful in insomnia. In my professional work it is invaluable, enabling me to complete a longer round in a shorter time, and of course sometimes its speed is of the greatest importance. I have kept no detailed account of its cost, but it is small, and would be much less if I had more time and it was cleaner work making adjustments and small repairs. My present cycle—my fourth—is a 3½ h.p. Phelon and Moore, and I know none better or more suitable. The two-speed gear is very useful in this hilly district (Wellington, Som.). I have just completed 5,000 miles without trouble, even with the chains.

R. C. Macdonald, M.D., M.B., C.M., L.R.C.S. Edin.

(1.) As a healthy pastime is very difficult to beat, it is a fine tonic, braces the nervous system, improves the general health, and moreover is a charming hobby. One gets as fond of one's motor cycle as in the old days of the horse. (2.) To a country doctor it is invaluable. For the last two years I have done daily runs of from twenty-five to 200 miles, and never had to walk home; in fact, the work of two horses and occasional train journeys is done in less time—one has thus more leisure. As to expense, I buy a new machine every twelve months, and reckon it about the same as one horse, say £50 a year, depreciation £25, and new tyres perhaps before necessary to avoid tyre trouble. This for a matter of, say, 6,000 to 8,000 miles a year. (3.) The most suitable machine is a single-cylindered one of 3½ h.p., with a two-speed gear and free engine. My ideal is one that can be started with a kick of the pedal (this is easier than hand starting) whilst striding the machine, then let in your clutch and glide away. I am

Dr. R. C. Macdonald.

waiting for this combination to be fitted to my favourite Triumph, and will then never want anything else. I have ridden the Triumph for two years, and have reluctantly ordered a Phelon and Moore for the above reasons, viz., you have to pay a visit half-way up a steep hill how are you to get to the top? Pushing and vaulting on do not suit a heavy weight.

Godfrey H. Bedford, L.M.S., L.S.A. Lond.

To the busy medical man a medium weight two-speed 3½ h.p. motor cycle with magneto ignition is invaluable, saving an immense amount of time when visiting one's patients. I consider a ride into the delightful country lanes of Old England on a motor cycle very healthy and invigorating, and well calculated to remove traces of brain fatigue, and refresh both mind and body. As to the cost, it is far cheaper than any other means of locomotion that I know of.

C. B. Moss-Blundell.

(1.) I see no reason to assume that motor cycling is in any way prejudicial to health, provided suitable clothing, goggles, etc., are worn. A motor cycle, especially in the country, is invaluable. (3.) Cost about one-third of a penny per mile on a twenty mile per day average, against 2½d. for a small 6 h.p. car, and 4d. for 10 h.p. car, licenses, insurance, etc., included. (4.) A doctor's machine must be essentially a "no trouble" machine, and of sufficient power and durability to take him anywhere in all weathers. My ideal machine, which I had built to my own specification, is a 3½ h.p. Zedel, adjustable pulley, gear 5 and 4 to 1, 20in. frame, 52½in. wheel base, spring forks, magneto ignition, pedal gear, rubber belt, two lamps (one gas and one oil), 4in. mudguards, step, carrier and strong footrests, which are essential for leaning the machine against a kerb, and 2¼in. tyres.

Motor Cycling for Health.—

T. W. L. Beales, M.R.C.S. Eng., L.R.C.P. Lond.

Having used a motor cycle for seven years in my practice during the summer months, my opinion is that it is a most exhilarating and healthy pastime, and it has been the most useful as well as the most economical

Dr. T. W. L. Beales.

means of getting about in my professional work, averaging about 1s. 6d. per 100 miles for upkeep. Undoubtedly the most suitable type of motor cycle for a medical man is the lightweight, with not more than 2½ h.p. engine, and weight from 80 to 120 lbs., owing to the frequent mounting and dismounting which must occur in visiting patients. At present I am using a 2½ h.p. Ariel in the summer months, and a 6 h.p. Rover car in winter, both of which are eminently satisfactory. I have dispensed with horses entirely.

D. R. G. Corrigan.

I have no doubt whatever that for myself motor cycling is a healthy pastime. I mean to stick to it. For most people, however, the machine used should be of modern type, so as to eliminate that form of hard labour playfully alluded to in your valuable paper as L.P.A. Motor cycling is the cheapest form of locomotion I know of where any considerable distance has to be covered. In fine weather the up-to-date motor cycle leaves nothing to be desired as a vehicle for country doctor's use. I think the all-weather motor cycle for town or country work has yet to come—and will come.

P Burrow, M.D., B.S.

(1.) In moderation a general tonic, stimulating the respiratory, circulatory, and nervous systems, promoting sleep, and increasing the appetite. (2.) For country practice motor cycling is the handiest, cheapest, and quickest method of locomotion I know of. During the last five years I have saved an average of two hours a day by using my motor cycle. Objections—difficulty in keeping neat, dust, mud, and skidding. (3.) I find cost per year one-quarter that of horse, trap, and man. (4.) For hard country work a heavy 3½ h.p., magneto, two-speed and free engine, rubber belt, footboards, convertible to three wheels in the winter.

H. Weigall, M.B., Ch.B. Mebl.

(1.) Motor cycling is a healthy pastime, inasmuch as it encourages people to go into the open air and away from towns, the absence of exercise being its greatest drawback. I think it a pity that pedalling gear is being so much discarded. (2.) It is of great value from a professional point of view. (3.) Much the cheaper form of rapid transit. (4.) An easy starting, silent, well sprung, absolutely reliable machine, fitted with studded tyres and efficient mudguards.

P. M. Moore, L.R.C.P. and S.

I think motor cycling is a most healthy and exhilarating pastime. I find it most useful in my professional duties. Most of my calls are three to nine miles away, and I find I can get about in one-third the time I could by any other method of locomotion. With a non-skid back tyre I am independent of roads and weather, and in two years experience have not yet had to walk home, though sometimes held up on the road. Motor cycling is far less expensive than making use of horse and trap. I think the most suitable type is 2¾ or 3½ h.p., single gear. My mount is a 3½ h.p. Brown.

Claude A. P. Truman.

(1.) Have you ever met a seedy-looking motor cyclist? (2.) For far-distant visits it is admirable, otherwise I prefer a push bicycle. (3.) My other experience is chiefly with a push bicycle, which is, of course, incomparably cheaper. (4.) The only motor cycle which I have been able really to use in all weathers and over all roads was a 4 h.p. Aster with Bozier gear. This was, without the shadow of a doubt, at once the most substantial and practical motor cycle I have ever had. In conclusion, the sturdiest engine I have ever had was this 4 h.p. Aster. The most flexible and kindest was a 9 h.p. single-cylinder Aster. The most lively was a 3 h.p. Fafnir. The most irresistible was a 5 h.p. Antoine, and the most disappointing—well, never mind!

James Monie, M.B., Ch.B.

Experience teaches that riding a high grade motor cycle equipped with spring forks and spring saddle-pillar affords a high degree of pleasure to the user, and is undoubtedly beneficial to his general health. The cycle I consider best suited to a doctor's needs is the well-known and tested Triumph. It is economical to run, absolutely reliable, easy to handle, has plenty of power which can be regulated for very slow or fast travelling. Fitted with Palmer tyres one can be absolutely free from side-slip on a surface however greasy. A Mabon clutch allows the cycle to be started and handled like a car. Two light metal mudguards supported from down tube of frame afford protection from all mud, and at the same time, while the cycle is in motion, cause a strong current of air to pass between them, keeping cylinder cool. A coating of silica enamel protects the plated parts from rusting. I have used a Triumph cycle equipped as described for professional work with perfect success and safety in all weathers throughout the entire year.

J. Henry Stormont.

(1.) After averaging fifteen miles daily on a motor cycle in all weathers for the past eighteen months I have felt no ill-effects whatever, and I use it almost exclusively now. (2.) In a scattered practice in a hilly district the motor cycle has solved the problem of locomotion for me. Cleaned daily by a boy, it is always ready to start, always brings me home again, is a constant pleasure to drive, and my speedy arrival in response to urgent calls is greatly appreciated by my patients. (3.) Far the cheapest means of locomotion, excepting bicycling—and walking. (4.) Single-cylinder 3½ h.p. with large splasher and non-skid.

T. B. P Wilkinson, M.B.

Motor cycling is, in my opinion, a fascinating and healthy pastime if the motor is an easy starter and has well-sprung forks and seat-pillar. Difficult starting spells heart strain. My motor cycle is very useful to m for long journeys and emergency calls It supplements my horse and carriage. If one gets in the beginning a good make of motor the cost of running is very small in comparison to that of keeping a horse. I live in a town with tramlines, and use a 2½ h.p. lightweight Ariel with spring forks and pillar and a Stanley-Dermatine belt. It is easy to start, powerful, and not too heavy. For a country doctor I think a powerful hand starting two-speed machine, such as Roc, would be best.

C. B. Wagstaffe, M.R.C.S. Eng., L.R.C.P. Lond.

(1.) Given a "no worry" mount it beats all other pastimes from the point of view of health, and is good for people who are subject to insomnia. (2.) The handiest and most convenient form of locomotion, especially for the country practitioner, enabling him to do his work in a short time and combine it with pleasure. (3.) I keep horse, trap, motor car, and motor cycle. Give me the latter for simplicity, quick starting, and cheapness. Its cost is one-tenth of the running expenses of either

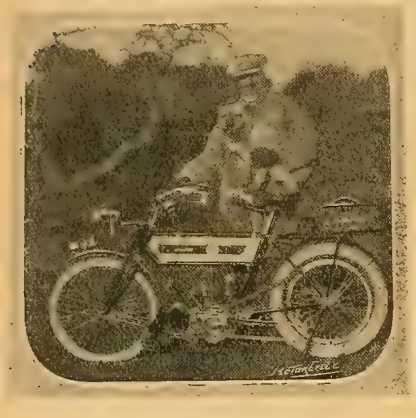
Dr. C. B. Wagstaffe.

of the others. (4.) Low built 3½ h.p. (magneto) with footrests, spring forks, and what is most essential, a good clutch or change-speed gear. My machine I have had fitted with Osborne four-speed, which is so far satisfactory.

Motor Cycling for Health.—

Frank Golding.

Motor cycling is a most healthy pastime. One has only to try it to be convinced of this fact. I must confess I am a fair weather rider, preferring the horse when the roads are wet. The



Dr. Frank Golding.

roads here (Co. Galway) are abominable in winter. The cost of motor cycling, beyond the initial expense, is trifling. It is an ideal method of locomotion. The Triumph is a splendid mount for a doctor. A fool-proof two-speed gear would be an improvement. I imagine the lightweight motor cycle will be very popular with doctors. Handle-bar control is an advance in the right direction.

Eward H. Ezard

My experience, founded on the use of tricars in a London suburban practice, may be summed up: (1.) Personally—general improvement in physical health and strength. (2.) As to practice—(a) increased leisure, and, therefore, more time for cases individually; (b) wider range, so that one can follow up patients who remove to a distance; (c) an ever-ready mount for emergencies and night work. (3.) As to cost, including depreciation and repairs (other than those done by one's self) about 7s. 6d. a week. My horse, man, etc., used to come to about £3 10s. a week. Under this head one may add cheaper holidays, with a wider range of interest therein.

W. Horton Date, M.R.C.S.

In my opinion motor cycling for those free from actual organic disease, if indulged in with commonsense and in reasonable moderation, is a very healthy pastime. I have used a motor cycle for my work in a wide country practice for over three and a half years, and have found it of unspeakable utility, saving a tremendous lot of time and exertion. The bugbear "vibration" exists to a most fallacious extent in the minds of the uninitiated. The cost, of course, is more as compared with the ordinary cycle, but very small as compared with the keeping of horseflesh. I now keep one horse where I used to have to keep three. My ideal machine is a low pedalless 3-4 h.p. with two-speed gear and free engine, with a leaning to chain drive.

T. Cuming Askin, M.D.

(1.) Have ridden 18,000 miles, but have only had one purely non-professional ride of about 130 miles. (2.) Invaluable in a country practice. For the last three and a half years have done most of my work on it. Side-slip in winter and when riding at night is what I most fear. (3.) Largely a matter of luck. Cost of upkeep ought to be nominal, apart from tyres, but the unexpected often happens. (4.) 3½ h.p. single-cylinder two-speed gear, efficient mudguard, without which daily riding is practically impossible.

E. W. S. Hughes.

Motor cycling is eminently healthy if taken in moderation and commonsense, and minus the plethora of "cigs" and "wets" it so often leads to. It is the locomotive *par excellence* for the country doctor, always ready night and day, goes anywhere, and reduces the tedium of the daily round by half. The only cheaper means of locomotion is walking. My motor costs about 2s. 6d. a week, and one week's "cabbing" cost me £2 7s. Type of machine depends on age and district. If old and hilly, free engine and two-speed gear as Roc. Young and level, any modern machine.

William Low, M.A., M.B., Ch.B.

As a pastime I think motor cycling delightful. One need never get overheated, even under very adverse circumstances, and can always wear sufficient clothing to prevent chills. For professional purposes I now prefer a lightweight. It is easily started, lifted on to the pavement, and vibration is practically nil. The cost of running is extremely small compared to running a high-powered machine, and is not to be compared to the cost of keeping a horse, trap, and groom. As for reliability, during the twelve months I have had my Motosacoche I have never had a stoppage of above a minute due to the engine, while I have not had more punctures than with a push bicycle. The roads here (Burslem) are extremely rough and hilly, but I have never found my hand in the least degree unsteady.

T. E. W., M.R.C.S., L.R.C.P.

(1.) I think motor cycling under proper conditions decidedly beneficial to health. Over-exertion, caused by difficult starting after stops, by excessively long journeys, particularly over bumpy roads, or by arduous pedalling on hills, is, of course, injurious, and should be avoided. Goggles should be worn, as the irritation from dust may cause inflammation of the eyes. (2.) Extremely useful for a country practice, especially in dry weather, but of little value for town work. (3.) The motor cycle, especially if supplemented by a push bicycle, is more efficient and much more economical than a horse and carriage. (4.) Undoubtedly a lightweight is best. The frequent restarting of a heavy machine after visits is too fagging. The ideal machine, I think (for professional work), is a lightweight, magneto, low built, and geared suitably to the hills of the district. It should be easy to start. For pleasure and touring I prefer the heavyweight.

Richard Lewis.

(1.) The modern motor cycle is undoubtedly a health-giving and a spirit-reviving machine, the abolition of vibration, and to a great extent of road shocks, having done away with the drawback of the pastime from a medical point of view. (2.) In a country practice the motor cycle is exceedingly useful. This district (Llanfyllin) is scattered and very hilly, with many bad roads, but I have found very little difficulty in getting about, provided the weather is fit for cycling. My machine is a 3½ h.p. Triumph, and has proved itself a splendid climber. (3.) After the first outlay the cost is very little, the only expense in my case being one non-skidding tyre, extra valves (two), and lubricating oil and petrol. It certainly is much cheaper than a horse, and has practically saved me the keep of one horse. (4.) Should be absolutely reliable and a safe hill-climber. Not too heavy to handle, and fitted with some contrivance which will enable the user to stop on hills to make a professional call and restart without going through the undignified proceeding of riding down the hill and then whizzing up past the house of his patient at 30 m.p.h.

W. Fisher Ward.

I consider motor cycling one of the, if not the, most health-giving of pastimes. It acts as a tonic to the liver and nervous system, and gives just that amount of exercise to muscles which is beneficial and requisite. Injurious vibration only exists in the imagination of non-riders. Motor car or horse driving I find have no particular beneficial effect, whilst the cost is at least ten times as great. A motor cycle is much the cheapest effective mode of locomotion a country doctor can possess. The pedal cycle is cheaper, but too slow and tiring. I have used a motor cycle professionally for the last four years. I keep a small Renault car also for night work and wet weather. Personally, I rejoice in my four-cylinder F.N. for its sweet and silent running. Previously I have had two single-cylinder machines. Non-mechanical minds would probably find a single-cylinder 1½ to 2½ h.p., such as the light F.N., very suitable.

Dr. W. Fisher Ward.

Owing to the large number of replies received, we intend to continue this interesting feature as space permits.

THE MOTOR CYCLIST'S IDEAL.

ON March 18th last we sent out with every copy of *The Motor Cycle* a postal voting paper with eight questions, which we reprint below with the percentages of the replies. This voting per was circulated for the purpose of obtaining the inions of our readers regarding the very vexed ques-n of the motor cyclist's ideal. We did not expect at the replies would be unanimous for any one ttern of machine or size of engine; in fact, we have ways told our readers that what is one man's ideal another's *bête noire*. We think a perusal of the rcentage figures will prove that, if any ideal exists all, it lies in the direction of a single-cylinder mount, ither too heavy nor too light, with a reasonable sized gine. In a word, *the efficient type of machine* we ve so consistently advocated from the date of the auguration of this journal.

At the same time, it should not be forgotten that ese replies to our queries are from readers who are more interested in what they are able to purchase w than what may be obtainable in the future. The ture is redolent of good things for motor cyclists; in e meantime, let us enjoy to the full what the makers ve provided for us. Our readers can rest assured at when the day of the "go anywhere, do anything" chine, weighing not more than 75 lbs., is in sight, d it is proved to be as efficient and reliable as its ightier brother, we shall not hesitate to say so. At esent we have contented ourselves with the statement at the machines of the lightweight class are capable carrying lightweight riders almost anywhere at derate speeds; they are extremely handy in traffic, d quite safe on the greasiest and worst winter roads.

Some Deductions.

Dealing with Class I., it will be seen that 41.42 per nt. favour a single-cylinder engine over 80 and not ceeding 85 mm. bore The reason for this is not far seek. The average machine of this size is not unduly avy, it should be an easy starter, and it is as near average rider's ideal as can be desired. With erence to the opposite extreme, the low percentage riders who support the four-cylinder motor bicycle omewhat surprising. Personally, we think the four-inder machine has a prosperous future before it. e four-cylinder car is the most popular type, on count of its smooth running, and on a motor cycle s smooth running is more important than on a car. Dealing with Question II., it is at once clear that the gle-cylinder machine leads easily, which is only ural, since it is the simplest form of motor bicycle ant. Motor cycling is a sport which is enjoyed by ny novices, who wisely start with the simplest icle they can find.

Question III. is important, as it serves to confirm our nion of the desirability of popularising the two-speed r. A mere glance at the figures shows that the jority are in favour of some such device. These rs are less complicated than riders would at first gine, and the price is sure to be less if more gears sold, but until a greater demand and greater supply forthcoming no reduction can be expected. It is a le curious that the majority of two-speed gear enthu-sts should be riders of lightweight twin-cylinders, l it is more curious still that as many riders of twin-inder heavyweights are in favour of the adoption of these devices as riders of single-cylinder machines of about 3½ h.p.

Dealing with Question VI., it will be seen, as was to be expected, that the larger and heavier the machine the greater is the demand for a friction clutch.

Question VII.—The replies to this query call for no special comment, as the lighter and less powerful machines require pedals, and the heavier and faster ones do not.

QUESTION I.

What sized engine (bore and stroke) do you favour for a motor bicycle to carry one rider?

REPLIES.

Under 75 mm.	9.35%
Over 75 and not exceeding 80 mm.	19.87%
Over 80 and not exceeding 85 mm.	41.42%
Over 85 mm.	2.33%
Twin-cylinder lightweights	4.67%
Twin heavyweights	20.09%
Four cylinders	2.27%

QUESTION II.

Do you prefer a single or a twin-cylinder machine?

REPLIES.

Single cylinder	73.01%
Twin cylinders	25.57%
Four cylinders	1.42%

QUESTION III.

Are you intending to order a change-speed gear?

REPLIES.	Yes.	No.
Under 75 mm.	59.94%	43.06%
Over 75 and not exceeding 80 mm.	58.88%	41.12%
Over 80 and not exceeding 85 mm.	56.11%	43.89%
Over 85 mm.	61.11%	38.89%
Twin-cylinder lightweights	72.22%	27.78%
Twin cylinders	61.48%	38.52%
Four cylinders	54.54%	45.45%

QUESTIONS IV. AND V.

Please state your weight, and what ratio of gear do you prefer to suit the machine you select, and to accommodate your weight?

The replies to these questions are governed to a very large extent by the size and type of engine; it is therefore unnecessary to give the percentage figures in reply to these queries.

QUESTION VI.

Are you in favour of a free-engine clutch without a two-speed gear?

REPLIES.	Yes.	No.
Under 75 mm.	29.17%	70.83%
Over 75 and not exceeding 80 mm.	32.03%	67.97%
Over 80 and not exceeding 85 mm.	30.10%	69.90%
Exceeding 85 mm.	50.00%	50.00%
Twin-cylinder lightweights	47.23%	52.77%
Twin-cylinder heavyweights	47.21%	52.79%
Four cylinders	54.54%	45.46%

QUESTION VII.

Are you an advocate of pedalling gear?

REPLIES.	Yes.	No.
Under 75 mm.	81.94%	19.06%
Over 75 and not exceeding 80 mm.	69.28%	30.72%
Over 80 and not exceeding 85 mm.	74.60%	25.40%
Exceeding 85 mm.	55.55%	44.45%
Twin-cylinder lightweights	58.33%	41.67%
Twin-cylinder heavyweights	44.72%	55.28%
Four cylinders	36.37%	63.63%

QUESTION VIII.

What do you consider the mininum weight for your ideal machine?

REPLIES.

Under 100 lbs.	8.48%
Over 100 and not exceeding 150 lbs.	44.13%
Over 150 lbs.	47.37%

Motor Cycling for Ladies.

By ATALANTA.

MOTOR cycling as a pastime for ladies has glorious possibilities. Why they have been so slow to grasp the advantages offered by the use of a motor cycle, with all its opportunities for enjoyment by indulgence in a pleasant and healthful recreation, and its handiness as a means of locomotion, must be a puzzle to many minds. Motor cycles for men have long passed the experimental stage. It is now quite four years since their machines became practical in every sense of the word—thoroughly reliable, capable of resisting ordinary and extraordinary strains, of withstanding long sustained wear and tear, or sometimes sad abuse, and yet their weight is such that any ordinary man or youth can easily handle and control them. Their running cost is scarcely worth consideration, and their first cost is reasonable, though varied. We have no cause to wonder at the fact that the army of men motor cyclists increased with such rapidity that now they must be numbered in thousands. Yet, strange to say, the number of lady motor cyclists can at present almost be counted on the fingers of the two hands. To me it seems that though there is now a great awakening of interest, there has existed, and still does exist, a mighty mass of misconception on the subject and prejudice regarding it, and it is the object of this present article to try to remove some of these prejudices.

Having been an ardent motor cyclist for nearly three years, it will perhaps be conceded that my knowledge of the subject is born of practical riding experience—experience of the trials and tribulations of the motorist, as well as of her joys and pleasures—and a very little practical experience usually will outbalance much theory.

Is Motor Cycling Suited to Ladies?

Most people, immediately the subject is broached, cry out, "Oh, motor cycling is not suited to ladies." Well! Why not? It must at the onset be admitted that a motor cycle is not a fat, shaggy, little pony, nor is its driving altogether an affair of whip and reins. It requires knowledge, constant carefulness, and intelligence, and women are not deficient in these qualities. They may not have the same mechanical aptitude as some men, nor that engineering ingenuity that overcomes insurmountable obstacles. Such genius, however, is not absolutely necessary to good driving; indeed, such traits in the ill-trained amateur mind often become a weakness, leading into the besetting sin of tampering with things that are far best left untouched. Of carefulness and of intelligence woman has her fair share; of mechanical aptness she has as much as is necessary for the purpose of driving a motor cycle. As proof, many ladies drive their c cars—powerful monsters, and clumsy to handle, c pared with the humble, handy motor bicycle—and they can drive these leviathans with ease and pleasu why cannot they drive the smaller machine?

Is a Woman Strong Enough?

How many thousands of women to-day p ordinary bicycles, machines equipped with gear c mudguards, and dressguards, and weighing from 2 35 lbs., or even more, and propel them every yar the way?—a weary, ceaseless grind that surely requ far more strength and energy than the management control of a self-propelled cycle weighing from 8 100 lbs. Of course, there is always the start t considered—an awful bugbear that is not altoge imaginary—but with the exercise of a little care thoughtfulness even this real difficulty is overcome

First see and know that everything is absolu right to ensure an easy start, and a start on l road is always certain without over-violent exertion. choice of position can usually be made, so when venient start on the down grade, and when out wi friend demand a push; a slight push is not n trouble to him, and will be of great assistance to In other ways, the control and steering of a m bicycle are as easy as the steering of a pedal bic Now and then as the road varies its contour, levers must be slightly altered to suit the condit Going uphill open the gas tap a little more; dow or on level road slightly close it again; going do steep hill the exhaust valve may be raised; but us on an ordinary main road mile after mile can be ri without giving heed to the levers at all, and in

The authoress, seated on the motor bicycle described in the accompanying article.

case handle-bar control is now becoming universal, there is no necessity to let go of the handles at The work of control also soon becomes al automatic, and is performed sub-consciously. I m

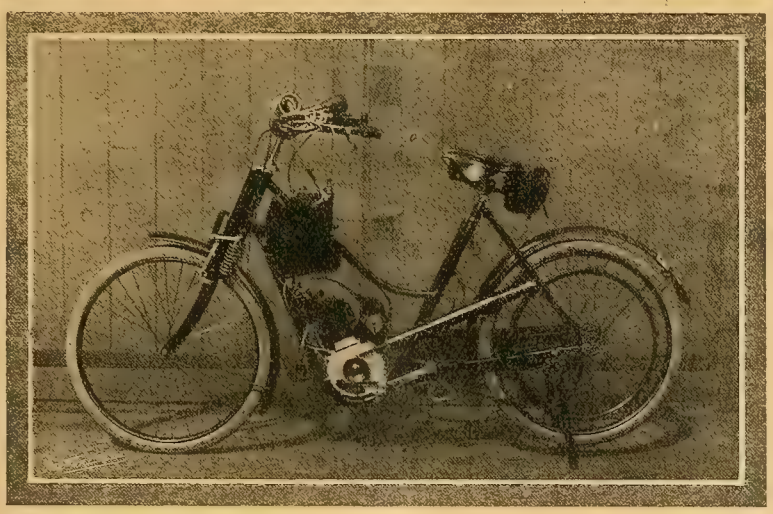
Motor Cycling for Ladies.—

ave often ridden 80 to 100 miles, and on more han one occasion over 120 miles, in a day, and een fresh enough at the end to go for a walk after tea.

Does it Look Well?

This is a question of first importance to every oman, excepting perhaps a few of the extreme uffragettes and "ultra-blue-stockings." Every woman ho has a womanly mind wishes to look nice, and ould turn hot and cold with horror at the bare idea f adopting the ungraceful attitudes or going about ith oily hands and dirty face in the manner of some f the enthusiastic amateur male mechanicians one ees at hill-climbs and other competitions.

Let me assure you there is no cause for alarm. Even e youngest and greenest male novice sooner or later iscovers that oily stains, characteristic poses, and echnical jargon, though they may be the hallmark f genius, are not essential to a full njoyment of the astime. A woman ho can free-wheel n ordinary bicycle n graceful style ith good carriage nd bearing, will de a well-designed nd suitable motor icycle in exactly ne same manner. here is no radical ifference between a dy's pedal bicycle nd a lady's motor icycle, the only dis-nction being that ne requires con-ant and continuous ushing from the der, like penance n the treadmill, hile the other is lf-propelled, continuously free-wheeling, a thing of eauty, a fit mount for its rider.



Mrs. Edward Kennard's Lightweight Clyde with Motosacoche attachment. The machine weighs 80 lbs., is fitted with Bosch D.A. 1 magneto, Druid spring forks, Price's stand, Palmer tyres, Rich's detachable tubes, and two-speed pedalling gear. Mrs. Kennard has done 50 miles in 2½ hours on this machine, and with light pedal assistance climbed Crow Hill, one of the steepest hills in the county of Leicestershire.

Mrs. Grundy says, "Doesn't it Look Fast?"

Ah! there's the rub. Mrs. Grundy asks the question, nd an answer must be returned with humility and eference, for, though she is powerful and spiteful at mes, she is a dear, good soul at heart, and, anyway, o lady likes to be considered fast. It may be that gain we shall have to take part in the old battle etween prejudice and progress, though surely in this se it will not be so fierce as on some former occasions. ome can yet remember how bitter was the contest hen ladies first took to bicycles, and how many arents and other authorities condemned the awful novation, though graciously permitting their girls use a tricycle, not because it was lighter and better ited to their smaller strength and powers of ndurance, but simply because it looked "more proper." et in the end good sense gave its verdict in favour of e suitable machine, and progress triumphed, as it ill again; for motor cycling is a really womanly stime, it is exhilarating, it is healthful and bene-ial, and, above all, it is exceedingly graceful.

The Suitable Machine.

These remarks, however, are based on the supposition that the lady rider mounts a suitable machine, and here arises a very real difficulty, for suitable machines are exceedingly scarce. The requirements of a lady are so exacting, and it is so imperative that every detail of construction should receive due and proper consideration, that the building of a lady's motor bicycle is a knotty problem, and one not to be too lightly undertaken; but surely it is not beyond the power of the skilled and experienced motor cycle engineer to produce a suitable machine at a reasonable price. Here I may say that my own opinion of what is suitable has been carefully formed after over two years of riding through a district of fair average difficulty as regards hills and road surface (in Bucks and a few holiday tours through the southern counties and it is offered only as a helpful suggestion to thos who contemplate building or purchasing, and not as a hard and fast statement of what is right and best, for people have different ideas and desires and purses, and some may consider a different sort of machine better suited to their own use. Frame must be of dropped pattern, with ample forward clearance, for ease of mounting and dismounting. The machine should be light, for ladies who desire to ride a motor bicycle are not Amazons, but ordinary English ladies, and machines often require to be handled; withal they must be strong—strong enough to feel solid and rigid, not vibrating unduly to the road shocks or in unison with the engine. To aid in this respect, the top dropped bar of frame may be built a little higher than is usual in the construction of a pedal bicycle, for there is but little pedalling to be done, and, anyway, it is useless to place this tube lower than the run of the belt. Girder forks, though not indispensable, add greatly to one's feeling of security. Spring forks are absolutely necessary; without them a long or fast ride is not at all a pleasure, but an ordeal. A well-sprung saddle is also a necessary luxury; it need not be unduly large. Have handle-bars of the ordinary cycle shape; long cranks, with a low gear for pedalling. My machine had 26in. wheels, with 1¾in. Clincher motor cycle tyres; probably a 2in. front and 2¼in. or 2½in. back tyre would be better. So much for the cycle parts. Now as to the works. A good engine is of the first importance, one with a fair turn of speed, and with plenty of power for the hills. Without speed there is no exhilaration in the pastime; without power there is much chagrin and hard work. Light pedalling on the hills spoils many a glorious sunset. A single-cylindered engine in inclined position under down tube

Motor Cycling for Ladies.—

is very suitable. This position tucks the engine well out of the rider's way, keeps the weight low down and forward, thus making the machine easily handled and well balanced when ridden. The carburetter may be placed in any convenient position according to the make of carburetter and engine, but care must be taken to avoid placing it where the skirt may prevent it receiving a free supply of air. Also see that it be placed low relatively to the tank, in order to secure a proper flow and head of petrol. My own machine as delivered was very annoying in this respect. With a tank holding a gallon, less than a quart could be used before the engine began to run erratically, and finally fail through starvation. The system of lubrication should be simple and reliable. An oily engine is an abomination, but an engine screeching for oil is anathema. I have found the Jap automatic sight feed lubricator perfect; when adjusted it requires absolutely no attention except to fill the tank when needed. There is no worry in trying to remember how many miles since engine received its last charge. Of course, there is ease in observation of a simple, infallible rule imparted to me when I used a pump: Always give another charge when you feel the engine beginning to lose power. But I fear that even strict observation of this rule must often rob an engine of many, very many, years of its useful life. I believe there are other automatic systems on the market, but have no personal experience of them. If the pump system be adopted, have the handle placed where it can be easily reached from the saddle, but also where in using it there is not the slightest possibility of the hand coming into contact with either wheel or belt. A very light touch from a rough belt fastener makes a nasty mound on the back of one's hand.

Specification of a New Ladies' Mount.

Thus far my opinion is altogether the outcome of practical riding experience. Further than this I go with extreme diffidence. Theories do not always work out in practice exactly as expected. Still, I have my own ideas of an ideal mount for a lady, and, having sold my machine, have already placed my order. The engine and accessories are to hand, and we only await the advent of a frame to begin the work of building. A very short specification and reason for some of the more important articles may perhaps be of interest: Engine, 3½ h.p. Jap, chain drive. Oppermann two-speed gear with clutch and starting handle. No pedals, but comfortable footboards. Bucket seat instead of saddle. Rear brake actuated by foot lever; clutch similar. Ignition by magneto. Coil and accumulator, also tool box and spares box, I intend to have placed under the footboards. For all these I have sufficient reason. The engine must be of ample power to take most hills on top gear. There must also be a good turn of speed in machine, or there is little pleasure in riding, for two reasons—first, speed in itself is delightful and exhilarating, want of it is depressing; second, when a lady rides a motor bicycle she needs enough speed to enable her to quickly shake off the scorching clubman cyclist. I digress to grumble. It is not without good cause that I say these young athletes, especially near London, are absolutely without manners; yet what they lack in manners they amply possess in impudence. From every other section of the community I have always received the kindliest consideration, but these smart City youths—they are contemptible. A fast machine is needed to quickly leave them far behind, panting after their long-sustained manly exertions.

The two-speed gear and clutch appeal to me most for starting purposes. Consider for a moment the difference between a man's and a lady's manner of mounting, and you will instantly perceive the great disadvantage under which a lady labours; it is not only a man's superior strength that tells its tale. A man to start runs alongside the machine, places one foot on the pedal, and swings the other over and around the back mudguard, and always has the machine going at at least a good fast walking pace before he springs into the saddle. A woman can give only one comparatively feeble push as she rises to the saddle and has to pedal from a practical standstill. The question is not so much, can she pedal it fast enough but will the left pedal come up and over the dead centre? With regard to starting by pedalling, a free engine clutch would probably be of very great assistance and make starting always sure and easy. I may be expecting too much from the two-speed and clutch yet, as it is on the same principle as a car's clutch it should start like a car, or alternately, with low speed in gear (11½ to 1); pushing machine along, the engine ought to start firing at a four miles an hour rate and at that pace mounting to the saddle would be neither undignified nor dangerous. The chain drive, I am told, is necessary with a very low gear. With the low gear, too, the machine should take every freak hill so, as they are not needed for either starting or hill climbing, pedals are useless.

One expects one's new machine to work wonderfully well, and I am no exception to the rule. At a later date, if it be considered of sufficient interest, I shall, with the Editor's permission, give a short account of how it does work, and, for the benefit of others who may be treading the self-same round, not hiding its faults, if any.

CURRENT CHAT.

SPECIAL FEATURES.

OUR HISTORIC HIGHWAYS (Illustrated).
MOTOR CYCLING FOR HEALTH (Illustrated).
THE MOTOR CYCLIST'S IDEAL.
THE AUTO CYCLE UNION QUARTERLY TRIALS (Illustrated).
THE M.C.C. MEMBERS' HILL CLIMB (Illustrated).

The First Race Meeting at the Stadium.

The motor cycle race on the Shepherd's Bush Stadium, organised by the Finchley Harriers, has been postponed from May 11th to Thursday, May 14th.

The End-to-end Trial.

We cannot urge too strongly the necessity for sending in entries for the End-to-end Trial as early as possible. The preliminary regulations, route, and entry forms are now ready, and copies will be sent to any motor cyclist who intends to compete, on application to the secretary, the Auto Cycle Union, 18, Down Street, Piccadilly, W.

Barnsley Victoria C.C. (Motor Section).

On Thursday, May 14th, a hill-climbing competition (A.C.U. formula) will be held at Stainboro' Park (by kind permission of Capt. Wentworth), to commence at 3 o'clock sharp. Prizes will be distributed by the Mayor (Councillor J. S. Rose). The rules state that persons crossing the course do so at their own risk. No dogs allowed. Entries should be sent to the hon. sec., S. Shone, 76, Blenheim Road, Barnsley.

International Auto Cycle T.T. Race.

The following entries have been received for the International Auto Cycle Tourist Trophy Race: Single-cylinder Class—C. R. Collier (holder), 1 Matchless; M. J. Schulte, 3 Triumphs. Multi-cylinder Class—H. Rem Fowler, 1 machine; T. Tessier, 1 Bat. As previously announced in *The Motor Cycle*, Mr. M. J. Schulte has kindly offered a silver cup to the first and a gold medal to the second and third private owners in the single-cylinder class. Further particulars of the race, entry forms, etc., can be obtained upon application to the secretary, Auto Cycle Union, 18, Down Street, Piccadilly, W.

Birmingham Motor Cycle Races.

Sport and Play, Lucifer House, Lionel Street, Birmingham, are organising a big cycle and motor cycle tournament at the Aston Villa Grounds on May 23rd. Colver, Collier, and Martin have already entered, and a series of three-cornered matches is being arranged between these three well-known racing motor cyclists. A special feature will be made of a race for fully equipped tourist machines as an inducement to ordinary road riders to take part in the racing. In addition, there is a handicap for light racing machines with a cylinder capacity limited to 76 by 76, or its equivalent cubical capacity.

Admission to Brooklands Track.

The 5s. enclosure at Brooklands has been done away with, and the ground included in the 2s. 6d. enclosure. The charge for admission to the reserved lawn has also been reduced from £1 to 10s.

Suggested Inter-club Meet in the South.

Northern motor cyclists have their annual meet at Richmond, and it has been suggested by the Western District M.C. that Southern motor cyclists should take part in an inter-club meet next July. There are many motor cycle clubs in and around London, and a successful meet should easily be organised. Other clubs are asked to take the matter up, and we shall be glad to publish suggestions as to a suitable place of meeting.

Police Traps.

Alderley Edge, Cheshire, on the main road to Congleton, beginning at Old Alderley Church and reaching to Monksheath cross roads.

Wanstead, one-eighth of a mile from the top of Wanstead Flats to the gate at Wanstead Park, on the Woodford Road.

Police traps are in operation on the Dundee to Perth Road, another on the Dundee to Arbroath Road, and still another in the Coupar Angus district.

Nice Motor Cycle Trials.

On the 26th ult. the Flying Kilometre Trials in connection with the above meeting were held on the Promenade des Anglais, Nice. Last week we gave the results of the reliability run, when Larippe (Moto-Rêve) was first in the multi-cylinder class, and Anken (K.D.) in the single-cylinder class. The times made in the flying kilometre test were: Multi-cylinder class—1, Guerrieri (Alcyon), time 53s. (or 42.18 miles per hour); 2, J. Larippe (Moto-Rêve), 1m.; 3, T. Larippe (Moto-Rêve), 1m. 2s.; 4, Berlié (Moto-Rêve), 1m. 3s.

In the single-cylinder class, Boriel (K.D.) was first in 1m. 6s., equal to 33.8 miles per hour. Petit (Terrot) second in 1m. 7s., and Raynaut (Werner) third in 1m. 11s.

The Hill-climb on La Turbie.

The hill-climbing competition on La Turbie, three kilometres in length, resulted as follows: Multi-cylinder class—J. Larippe (Moto-Rêve), 4m.; 2, F. Larippe (Moto-Rêve), 4m. 30s.; 3, Guerrieri (Alcyon), 4m. 50s.; 4, Berlié (Moto-Rêve), 4m. 58s.

Single-cylinder class—1, Petit (Terrot), 4m. 22s.; 2, Borel (K.D.), 4m. 55s.; 3, Raynaut (Werner), 5m. 18s.; 4, François (Alcyon), 5m. 33s.; 5, Anken (K.D.), 5m. 45s.; 6, Amerio (Motosacoche), 9m. 45s.

On the general classification, which was calculated on a formula in which total weight figured prominently, the result was: Multi-cylinder Class—1, Berlié (Moto-Rêve), 153 points, gold medal; 2, F. Larippe (Moto-Rêve), 152, silver medal; 3, J. Larippe (Moto-Rêve), 151, bronze medal.

Single-cylinder Class—1, Amerio (Motosacoche), 155 points, gold medal; 2, Petit (Terrot), 136, silver medal; 3, Anken (K.D.), 130, bronze medal. The Nice Automobile Club has decided to organise another competition on similar lines next year, when valuable trophies will be offered.

Brooklands Motor Cycle Race.

The motor cycle race which will be contested on the Brooklands Track on Saturday will, as previously announced, be a handicap. The starts will be allotted by time allowances, so that each machine will have to cover the full distance. Competitors will be despatched singly, and the start will probably be just opposite the entrance to the paddock. No starters will be allowed on this occasion.

THE ENTRIES.

The splendid total of thirty-one entries have been received for the race next Saturday, viz., W. H. Wells, 5 h.p. Vindec Special; H. P. Beasley, 5 h.p. Rex; F. G. Andraea, 5 h.p. Rex; G. Aldington, 3½ h.p. Kerry; W. H. Bashall, 3½ h.p. Triumph; A. Wright, K.D. Lightweight; B. C. Lamb, 4½ h.p. F.N.; A. Sproston, 5 h.p. Vindec Special; E. Pond, 5 h.p. Vindec Special; M. Geiger, 6 h.p. N.S.U.; H. G. Partridge, 6 h.p. N.S.U.; W. W. Genn, 7-8 h.p. Minerva; J. C. Davis, 5½ h.p. Rex; R. O. Clark, 4½ h.p. F.N.; W. E. Cook, 7 h.p. N.L.G.; F. W. Newsome, 3½ h.p. Triumph; F. Toman, 4½ h.p. Laurin and Klement; J. Merfait, Laurin and Klement; H. A. Cooper, 3½ h.p. Triumph; R. M. Brice, Brown; A. G. Reynolds, 5 h.p. Vindec Special; H. Shanks, 2¾ h.p. Chater-Lea; T. H. Tessier, 6 h.p. Bat; G. L. Evans, 3½ h.p. Rex; E. Kickham, 7 h.p. Leader (Peugeot engine); W. G. McMinnies, 3½ h.p. Triumph; G. L. Fletcher, Moto Rêve; R. Mundy, 3½ h.p. magneto; G. Dedman, Dedbury (De Dion engine); A. Mayer, Buchet; W. Pershke, Diamond.

Auto Cycle Union Quarterly Trial.

LAST Wednesday the Spring Quarterly Trials organised by the A.C.U. were held over the usual course from Uxbridge to Banbury, *viâ* the Oxford Road, Wheatley, and Islip, and back *viâ* Bicester, Chesham, Amersham, and Beaconsfield. The entry was a good one, thirty-one competitors signing their forms, and of these twenty-nine started. For the first time since these useful and interesting trials have been organised, not a single passenger machine took part, which is strange, since up to the present not a single motor bicycle with a sidecar attached has made a non-stop run on this by no means easy route. The lightweight class, however, was well represented. Wednesday's event presented several fresh features. Firstly, every sort of road condition was encountered—mud, slime, snow, dry and good roads, rough surface, and floods. Secondly, the results on the hills were divided into three classes. Lastly, the time of the fastest machines on either or both of the hills was not made public. From Uxbridge to the foot of Dashwood Hill the roads were heavy, muddy, and treacherous, so that most of the competitors' engines were somewhat hot before they reached the foot, a fact which probably accounted for several failures. Never yet since the Quarterly Trials have been held has every machine climbed Dashwood Hill satisfactorily, and this is "a consummation devoutly to be wished!"

Quarterly Trials competitors (McMinnies, Newsome, and Watherhilt) negotiating the flooded roads on the way to Aylesbury. The engines were immediately converted from air to water-cooled. The riders also experienced a cooling effect to their feet!

Dashwood Hill Performances.

The following is the results of the Dashwood section of the competition, the figures representing the difference in time between each competitor, while a few remarks are appended against the performances of the majority of the machines.

Class I. (single-cylinder machines).—W. G. McMinnies (3½ h.p. Triumph), excellent, 0; F. W. Newsome (3½ h.p. Triumph), 4⅖s., excellent; G. Lee Evans (3½ h.p. Rex), very good, 16s.; D. F. Steeves (3¾ h.p. N.S.U.), very good, 31⅖s.; W. A. Tyndale (3½ h.p. N.S.U.), pedalled hard, fair, 51⅖s.; C. R. Taylor (3¾ h.p. N.S.U.), steady, no pedalling, 52s.; H. Newey (3½ h.p. L.M.C.), steady, no pedalling, 1m. 13s.; R. Samson (3½ h.p. L.M.C.), pedalled, 1m. 7⅖s.; P. Watherhilt (3½ h.p. Zenette) dismounted twice and restarted, 1m. 37⅖s.; H. B. Lewis (3½ h.p. Triumph) dismounted.

Class II. (twin-cylinder machines).—F. W. Applebee, jun. (5 h.p. Rex), excellent, 0; M. Geiger (6 h.p. N.S.U.), ⅗s., excellent; F. W. Applebee (5 h.p. Rex), excellent, 1⅗s.; H. G. Partridge (6 h.p. N.S.U.), 18s., very good; J. Stuart-Shaw (5½ h.p. two-speed Phänomen), good, top speed, 1m. 31⅕s.; Miss Hind (5 h.p. Rex) stopped on the hill and restarted with ease with the clutch, 3m. 1⅗s.; H. Fuller (3½ h.p. Diamond) dismounted.

Class III. (lightweight motor bicycles).—G. L. Fletcher (2 h.p. Moto-Rêve), pedalled, 0, good; R. J. Bell (2 h.p. Moto-Rêve), good, no pedalling, 2⅘s.; J. V. Robinson (1¼ h.p. Motosacoche) pedalled slightly, 10s.; P. Phillips (2¾ h.p. Douglas), good, no pedalling, 11⅗s.; W. W. Douglas (2¾ h.p. Douglas), fair, pedalled, 12s.; W. Smith (1¼ h.p. Motosacoche), fair, pedalled, 16⅗s.; R. D. Yardsley (2½ h.p. Fairy), fair, pedalled, 1m. 38⅗s.

After Dashwood Hill had been surmounted, the roads improved a good deal, but after Wheatley, a few miles along the Islip Road, they became very greasy for a short distance. In this district the floods were considerable, Islip looking like an island in a great lake. At Bletchington, also, they were considerable. On the main road from Oxford to Banbury the surface and road conditions were for the most part excellent.

Auto Cycle Union Quarterly Trial.—

All through Oxfordshire the police behaved admirably. In none of the counties traversed did they assume a hostile attitude, but in Oxfordshire they were a real help to the men. At every cross road and dangerous or doubtful turning a constable was stationed, and on many occasions the men were directed by a kindly policeman. Just after Aynho, which, unfortunately, is just over the border in Northamptonshire, where the route leaves the Buckingham Road, there is a doubtful turning, this time unmarked by an arrow. Would that it had been in Oxfordshire. After lunch at Banbury came the most exciting part of the day's journey. The roads were good and dry, but dustless, when some miles beyond Bicester a stretch of flooded road was suddenly encountered. We were ahead of the men at the time, but while we were considering what to do, three of the lightweights took the water like ducks. Their engines being high in the frames took no harm, and with the aid of a little pedalling they got through about 400 yards of water, which was 6in. deep in parts. One competitor left the road and found himself in a ditch two feet deep. Miss Hind was conveyed across in one car, while Reynolds piloted her bicycle through, being

Three Quarterly Trials competitors entering Banbury.

towed by another car. To see some of the men plunge into that swift-running stream which coursed across the roadway, flinging the water far and wide, was a sight to behold, but motor bicycles with low placed magnetos and belt transmission are not a success for aquatic performances. One more stretch of flooded road had yet to be encountered, but this was fortunately a short length, and the rest of the road was in fair condition, though very rough and sadly in need of repair in places. At the foot of Gore Hill, each man was made to dismount and make a standing start, a wise precaution, as the corner at the foot is awkward, if not dangerous. As on Dashwood, there was more traffic than usual on the hill, but as a contrast to the former the surface was loose and in very poor condition.

Results on Gore Hill.

The following are the results of the climb:

Class I.—W. G. McMinnies (3½ h.p. Triumph), 0; F. W. Newsome (3½ h.p. Triumph), 4s.; G. Lee Evans (3½ h.p. Rex), 4⅖s.; H. B. Lewis (3½ h.p. Triumph), 27⅗s.; H. Newey (3½ h.p. L.M.C.), 36s.; C. R. Taylor (3¾ h.p. N.S.U.), 44⅕s.; R. Samson (3½ h.p. L.M.C.), 53⅖s.; P. Watherhilt (3½ h.p. Zenette), 59⅗s.; F. W. Barnes (3½ h.p. Zenette), 1m. 19⅕s.

Class II.—M. Geiger (6 h.p. N.S.U.), 0; F. W. Applebee, jun. (5 h.p. Rex), ⅘s.; F. W. Applebee (5 h.p. Rex), 2⅗s.; H. G. Partridge (6 h.p. N.S.U.), 10⅖s.; H. Fuller (3½ h.p. Diamond), 33⅘s.; J. Stuart Shaw (5½ h.p. Phänomen), 58⅗s. Miss Hind stopped and restarted on several occasions.

Class III.—G. L. Fletcher (2 h.p. Moto-Rêve), pedalled, 0; J. V. Robinson (1¼ h.p. Motosacoche), pedalled, 2⅗s.; P. Phillips (2¾ h.p. Douglas), 4⅗s.; W. Douglas (2¾ h.p. Douglas), 13⅖s.; G. Connor (2½ h.p. Fairy), 18⅕s.; R. D. Yardsley (2½ h.p. Fairy), 20⅘s.; W. Smith (1¼ h.p. Motosacoche), pedalled, 32⅗s.; R. J. Bell (2 h.p. Moto-Rêve), pedalled, 39s.

Below we give a summary of the performances:

F. W. Newsome (3½ h.p. Triumph), non-stop. J. Stuart-Shaw (5½ h.p. Phänomen, Nala two-speed gear), non-stop. H. H. Newey (3½ h.p. L.M.C.), non-stop. R. Samson (3½ h.p. L.M.C.), one puncture; will probably be awarded non-stop certificate. G. Lee Evans (3½ h.p. Rex), non-stop. W. G. McMinnies (3½ h.p. Triumph), one traffic stop; will probably be awarded non-stop certificate. E. R. Taylor (3¾ h.p. N.S.U.) stopped in error on top of Gore Hill; will probably be awarded non-stop. G. Fletcher (2 h.p. Moto-Rêve), non-stop. J. V. Robinson reports three punctures; if no further trouble was experienced he will probably receive a non-stop certificate. P. Phillips (2¾ h.p. Douglas), W. W. Douglas (2¾ h.p. Douglas), and F. W. Applebee (5 h.p. Rex), non-stops. F. Applebee, jun. (5 h.p. Rex), non-stop; one puncture repaired under observation. H. G. Partridge (6 h.p. N.S.U.) may also be awarded a non-stop certificate, since he only stopped to ask his way at Amersham. D. F. Steeves (3¾ h.p. N.S.U.), three punctures; dismounted on Gore Hill through slipping belt. W. Barnes (3½ h.p. Zenette) had change speed hand wheel fixed on in repair shop in High Wycombe; otherwise completed course satisfactorily. M. Geiger (6 h.p. N.S.U.), magneto driving chain came off. H. Fuller (3½ h.p. twin Diamond) dismounted on Dashwood through slipping belt, due to wet. Miss Hind stopped on Dashwood Hill through plug and valve spring trouble; puncture near Bletchington; also several stops on Gore Hill, probably due to overheating. W. A. Tyndale (3½ h.p. N.S.U.), belt broke on Gore Hill. R. Bell (2 h.p. Moto-Rêve), belt came off. G. Connor (2½ h.p. Fairy), several stops to replace inlet valve cotter. R. D. Yardsley (2½ h.p. Fairy), one stop; front wheel spindle nuts loose. W. Smith (1¼ h.p. Motosacoche), one stop; short circuit three miles from start. H. B. Lewis (3½ h.p. Triumph) dismounted on Dashwood. P. Watherhilt (3½ h.p. Zenette) ran out of petrol and adjusted belt. Retirements: E. J. Browning (4 h.p. N.S.U.), punctures. J. Beck (2½ h.p. Fairy), engine trouble. L. W. Bellenger (3½ h.p. L.M.C.), carburetter trouble. The judges on this occasion were Messrs. A.G. Reynolds and A. Sharpe; the timekeepers Messrs. F. Straight and A. V. Ebblewhite. Among the other officials may be mentioned Messrs. H. G. Bell, W. Grew, C. A. Smith, J. Van Hooydonk, and E. M. P. Boileau.

The M.C.C. Members' Hill-climb.

THE above competition took place last Saturday at Sharpenhoe, four miles north-west of Luton. The hill is admirably suited for a hill-climb, being almost straight and practically devoid of traffic.

Everything passed off satisfactorily, and the Bedfordshire police, who sent down an inspector and two or three constables, were of great assistance in keeping the course clear. The number of spectators present was considerable, and these, owing to the nature of the hill, had an excellent view of the competition, without there having been necessity to crowd all over the course, since the high banks on either side of the road would have afforded accommodation for double the number. The weather was gloriously fine, and a light breeze blew up the course, but the surface of the hill was rather

Mr. E. W. Brewerton makes fastest time in the Passenger Class.

loose in places. The motor cycle entries were thirty in number, and were divided into three classes—Class I. for single-cylinder motor bicycles, Class II. for twin-cylinder motor bicycles, and Class III. for passenger machines.

Owing to the temporary scales rigged up at Sharpenhoe not being satisfactory until they had been tuned up, the hill-climb did not begin till forty-five minutes after the advertised time, but once started it was run off quickly.

In Class I., R. M. Brice made the fastest time on the 3½ h.p. Brown. He rode magnificently, and the machine travelled in excellent form, covering the course in 50⅘s. Next in order of time came W. A. Sale, who came up in good style on a 3½ h.p. Rex in 52s. W. A. Jacobs, on a similar machine climbed well, but his engine appeared to be missing, time 1m. 0⅗s.; C. C. Cooke, 3½ h.p. Phœnix, excellent, time 1m 1⅘s.; P. H. Trotman, fair, time 1m. 8⅘s.; Dr. C. Gibbon 3½ h.p. Deacon-Minerva, missed fire, time 1m. 15⅘s.; J. P Le Grand, 2½ h.p. Matchless, came steadily and well, time 1m. 18⅘s.; J. Stuart-White, 1¼ h.p. Motosacoche, over lubricated and belt slipping, pedalled, time 1m. 46s.

Class II.—W. H. Wells, 5 h.p. Vindec, splendid performance, time 49½s.; E. Pond, 5 h.p. Vindec, excellent, 51⅘s. F. White, 5 h.p. Rex, excellent, 52⅘s.; Miss Hind, 5 h.p Rex, rode splendidly, and was greeted with hearty applause 53s.; O. L. Summers, 5 h.p. Vindec, climbed the hill in good style, 53⅕s.; C. H. Barfield, 5 h.p. Vindec, good, 55s.; S H. Fry, 5 h.p. Vindec, took the corner beautifully, 55⅖s. W. A. Sale, 5 h.p. Rex, and A. S. Phillips, 5 h.p. Vindec equal, 56⅖s.; A. G. Reynolds, 5 h.p. Vindec, 58⅗s.; S. G Frost, 4½ h.p. Minerva, 58⅗s.; C. J. Seed, 5 h.p. Vindec 1m. 0⅖s.; V. Olsson, 5 h.p. Vindec, 1m. 2⅖s.; T. F. Cox 5 h.p. Rex, 1m. 4⅖s.; W. Pershke, 3½ h.p. Diamond, pedalled (brake band apparently binding somewhere), 2m. 1⅖s.

Class III.—Dr. E. W. Brewerton, 10 h.p. Lagonda tricar came up well, but changed into first speed rather late, time 1m. 58s.; A. F. Ilsley, 5-6 h.p. Phœnix, came up well, time 2m. 57⅖s.

After the course was clear again, the car class was run off Mr. S. F. Edge (40 h.p. Napier) making the fastest time namely, 1m. 2⅖s. We mention this fact to show where the 40 h.p. six-cylinder would have been had it competed with the motor cycles. It would have been beaten by twelve of the twin-cylinder machines and four of the single-cylinder motor bicycles. Motor cyclists, therefore, still hold the field as far as hill-climbing is concerned.

After the competition was over the officials adjourned to the George Hotel, Luton, where the times were given out. The results of the hill-climb are worked out on Professor

$$\text{Callendar's formula} \quad \frac{T \times C}{W} \quad \text{(not worked on Saturday at 7.30)}$$

The following are some of the officials who were responsible for the competition: Judges, R. H. Head and R. C. Davis; timekeeper, F. T. Bidlake and assistant; marshal, Victor Abraham; clerks of the scales, F. Mussell and R. C. Davis.

CLUB NEWS.

The Newcastle Motor Club.

The result of the speed-judging competition held at Belsay on Good Friday has been announced as follows: 1, J. Shaw (4½ h.p. Minerva with sidecar); 2, Jas. Moore (3½ h.p. Dene); 3, A. J. Lucas (6 h.p. Rover).

Western District M.C.

It has been decided to hold a reliability trial on May 17th, the course being from Hounslow to Bath and back. The winner to be the competitor who does nearest to twenty miles per hour, but the speed limit must not be exceeded.

Glasgow M.C.C.

As usual, this club's competitive events commence with a hill-climbing contest, and this will be held on the Peesweep Hill, Paisley, on Saturday, 16th inst. The contest is an open one. Entries must be lodged by this day week with the hon. sec., J. S. Fulton, 131, West Regent Street, Glasgow.

Richmond and District M.C.C.

The opening run takes place on May 10th to Frensham Ponds. The captain of the club kindly promised a challenge cup to be competed for on July 11th in a reliability trial. Six competitions have been arranged, for which prizes and medals will be awarded. Week-end trips are arranged for Petworth, Brighton, Worthing, and Henley-on-Thames.

The Marquis de Mouzilly St. Mars has kindly consented again to accept the presidency of the club.

The annual subscription is 7s. 6d., with entrance fee of 2s. 6d., and the hon. sec., H. C. King, Walton House, Surbiton Road, Kingston-on-Thames, will be pleased to hear from intending members.

Birmingham M.C.C.

This club held its first competition in 1908 on Rose Hill on Saturday last, in glorious May weather. The course was lined from end to end with spectators, and it was estimated there were over 150 motor cyclists through Rednall on Saturday afternoon. Electrical timing was used, this being in the hands of Mr. R. V. C. Brook, trials hon. sec., and Mr. J. Thompson. Mr. Duke, captain, was starter at Longbridge. Results.

CLASS B.—Machines with single cylinders of any capacity. Fastest time, R. Samson, 3½ h.p. L.M.C.
Order of merit on formula.

		F.M.
1.	R. Samson (3½ h.p. L.M.C.)	640
2.	F. G. Sandison (3½ h.p Triumph)	629
3.	F. C. Mustard (3½ h.p. Triumph)	624
4.	A. M. Lomax (3½ h.p. Triumph)	600
5.	E. W. Winckle (2 h.p. Clément)	340
6.	A. E. Willy (3½ h.p. Brown)	184

CLASS C.—Machines with twin-cylinders of any size.
Fastest time, H. C. Rapier (5 h.p. N.S.U.).
Order of merit on formula.

		F.M.
1.	Seymour-Smith (5 h.p. Norton)	458
2.	D. Royce (5. h.p. Norton)	424
3.	H. C. Rapier (5 h.p. N.S.U.)	412
4.	F. Southam (5 h.p. Vindec)	352
5.	W. Pillington	336

[Owing to great pressure on our news pages several items of club news are unavoidably held over.—ED.]

Extract from "The Motor Cycle" of March 25th, 2008.

INTERESTING DISCOVERY IN THE W. LONDON.

[*From a Correspondent.*]

"An interesting relic has been overed in the suburb of Kingston, ondon, W., believed to date from the arly years of the twentieth century. he accompanying telepathotograph (repro-uced) may prove of interest to your aders.

"In the interests of our readers we have ubmitted a print to the deputy-vice-assist-nt-sub-editor of the current 'Times History f the World.' [See advertisement supple-ent pages 3-301.] We quote his report erbatim. 'Apparently,' writes Mr. Auto lobel, 'it represents the apotheosis of a olice constable of the period. Colour is nt to this supposition by the locality of s discovery. It is a well-known fact Or should be (See pp. 84-1001½ "T.H. the W.")—ADVT.] that the authorities of his district held the "Genus Constabu-re" in reverent esteem and awe. He as worshipped under the titles of "The Jnimpeachable," "The Well of Truth," c., etc. A well-known witty magistrate f the period is reported to have spoken of im as follows: "He is always to be found his George Washington Post." (Laughter, which the police were conspicuous.)

[P. 101.—Advt.] In assigning an exact date to this undoubted antique considerable difficulty arises. During the first decade of the past century numerous associations and unions formed for the purpose exposed the cult of the constable as a degrading and effete superstition. This, then, may be either (*a*) a memorial window erected by a few surviving members of the faith, or (*b*) erected in jubilation during the more enthusiastic period of the cult. Of these the latter is more probable. "Sanctus Robertus" is represented in a triumphing attitude. In his left hand the stop-watch (a crude mechanical fetish which the naive craftsman of this date has represented resembling rather a barometer), in his right hand what is apparently a tape measure. His right foot is placed upon a bag containing money (no doubt fines), under which is seen a quaint little figure, presumably the motorist of that date in process of being crushed beneath their weight. With regard to the symbol XXX following the title, I can offer no explanation.'"

[Possibly this last is intended to signify the nectar, as it were, which, it was commonly supposed, was the reward of all successful constables. In this connection it would represent, therefore, a brand of ale.—ED.]

O, Love it is a funny thing,
It tickles poets in the spring,
It caused young Robinson to bring
His girl out in a trailer.

The way was short, the rider bold,
The motor was by no means old;
So fast the merry miles unrolled
Behind the girlful trailer.

"Now hold on tight, O girl of mine,
I'm going to shave this corner fine,
Off S. F. Edge I'll take the shine!"
A squeal came from the trailer!

He heeded not, but on he tore,
And even faster than before,
Until at length by Brighton's shore,
He pulled up with the trailer.

The sun fades sudden from his sky;
With pallid face and ruffled tie
He gazes with a frenzied eye
Upon an empty trailer.

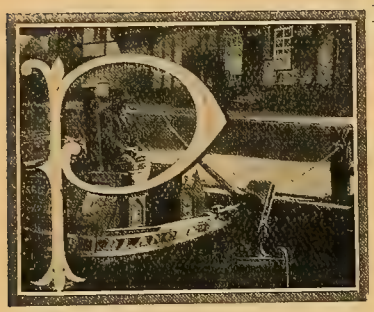
* * * * *

No more will Robinson be seen,
To mote with his affection's queen.
And advertised you'll note: "Machine
For sale, complete with trailer."

MORAL: Have a sidecar! —H. R. T.

Meet of South African motorists on the occasion of the first run of the East London and Border A.C. The hon. sec. *pro tem.* Mr. H. Barnes, is seen standing to the right of the sidecar with a Quadrant Motor Bicycle. *Photograph by J. Knibbs.*

Photography and Motor Cycling.



PHOTOGRAPHY is now so popular a pastime that it needs but little excuse to write of it in its particular applications to the needs of the motor cyclist. Considerations of weight and space are so important in this connection that it may often happen that the rider who would carry his camera is prevented, or thinks he is prevented, from doing so because his camera may be too bulky or he may have no convenient method of attachment to his machine. The serious photographer with aspirations towards art will probably prefer a three-wheeler or a small car for the convenient transportation of his impedimenta, but the motor bicyclist, who is not always in a hurry, finds photography, especially when on tour, a very pleasant side issue to the main pastime.

It is to illustrate this point that I have asked the Editor to use a restful little hand camera picture made at Tewkesbury on one of many delightful little holidays on wheels as a beginning to these jottings.

Naturally, the first question which occurs to one is, What camera shall I use? And the answer is that the instrument with which the photographer is most conversant will give the most satisfactory results, if for no other reason than that motoring photography is hardly the deliberate occupation of the serious picture-maker, but partakes more of the reminiscence or snap order of things. If, therefore, the motor cyclist is the possessor of a box form hand camera, with which he has been accustomed to work, and he wants to use that on his travels, some such little device as is shown in fig. 1 will be useful. Here the rider is represented as carrying the camera, which is a box form magazine camera, on his back, the suspending device being made of light brown webbing to match the coat, and so devised as to distribute the weight and pull evenly between the two shoulders, with no interference with the chest or breathing department. The webbing arrangement complete costs about 5s., only weighs a few ounces, and is called a Camsac, and can be purchased at Fallowfield's, in Charing Cross Road, and possibly elsewhere. It may be noted here that one of the things which trouble the motor cycle photographer is dust and dirt on the plates caused by vibration, and, of course, actual dust upon the road. As regards the vibration trouble, there is no doubt that the best way to minimise this trouble is to carry the camera on the person, and, personally, I think the method just described is the least inconvenient way.

An alternative method, if a folding camera is available, is to carry it in a leather case, as shown in the illustration on page 360. Carried in this way, a roll film camera is very convenient, and can be quickly got into action, and as expeditiously limbered up again. With a spare roll or two in one's pocket or toolbag, a large number of exposures can be made. The box camera presupposed the use of glass plates; the folding camera involves the use of films, which are

Fig. 1.—A magazine camera suspended from the shoulders by means of a Camsac.

Fig. 3.—Another method of carrying the photographic outfit which can be highly recommended.

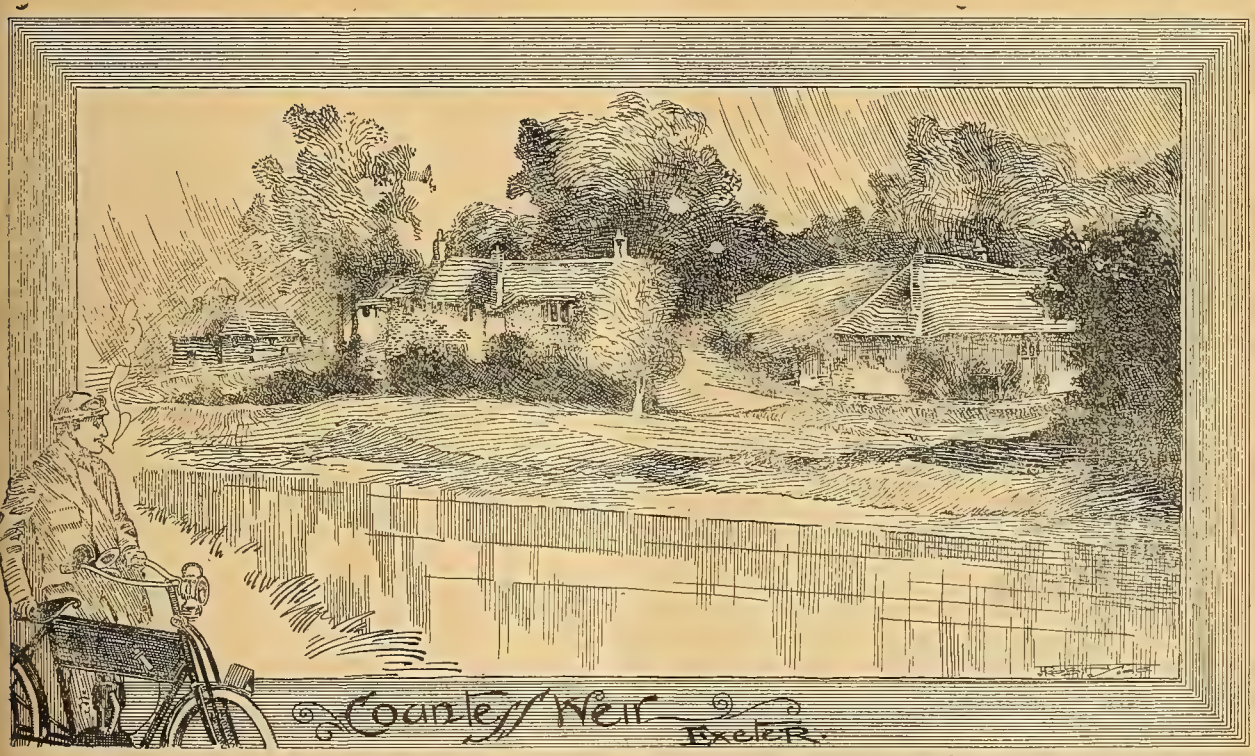
Photography and Motor Cycling.—

however, now made fairly reliable in quality.

But, it may be said, why not be a serious photographer, and use a stand camera? Well, in that case any attempt to carry the camera and stand upon the person would be irksome, and I know no other method than to pack them upon the carrier, as indicated in fig. 4. In this case, to minimise the effects of vibration as far as possible, it is advisable to pack the camera in a cover of some kind. For this purpose, a leather or pegamoid case should be selected, but somewhat larger than the camera, which should be wrapped tightly round with some soft material. One or more velvet focussing cloths will do, or any material which will act efficiently as a buffer to absorb the road vibrations. It is important that the camera so enveloped in its cloths should be tightly held in the outside case, which in its turn should be very tightly strapped to the carrier. For this purpose, pieces of webbing fitted with buckles are better than leather straps. One more precaution is advisable, viz., to ride with the back tyre as soft as possible; in fact, use every possible device to make the running of the motor cycle as easy as possible. There is an adage which says that if you want a thing well done, do it yourself. I would not like to dogmatise on this subject, but an enthusiast of my acquaintance has assured me that in this connection there is a better way, and to illustrate his method of combining the interests of photography and motor cycling he has sent me the photograph from which fig. 3 was made, which represents the method of carrying the apparatus which he finds least irksome.

AN 409.

Fig. 4.—A camera and telescopic stand packed tightly on the carrier of a 2½ h.p. Rover Motor Bicycle.



How The New Mount Scored.

LEONARD GORDON felt particularly pleased as he read the note from his agent, "Am expecting delivery of your new motor bicycle to-morrow." Visions of pleasant runs and a good time at the coming Whitsuntide holidays filled his mind. Next day, as soon as he was free, he went down to the shop. There, surrounded by the litter of its crating, stood his new twin-cylinder mount, upon which he had spent so much consideration and thought. There was no doubt it looked a regular beauty, with every promise of speed and comfort. He felt pleased with his judgment. Power for the hills in which the district abounded was certainly there. More especially to the farm on the moorlands would this be useful, a route which he often took. The glorious view was by no means the only attraction of this wild and somewhat desolate spot. Leonard Gordon's heart told him that Kitty Lloyd was worth many a good mile to go and see. He was always welcome at Moor Farm. Mr. Lloyd was a pleasant man, but there was one thing that he certainly was—an anti-motorist. Often had Leonard listened to his diatribes. Tactfully he avoided arguing the subject with him. Generally he was able to lead the conversation into pleasanter and safer channels. Diplomacy in this respect, coupled with the newspapers and local news which he took with him, helped to keep them on a friendly footing.

The First Ride.

The following day, being a half-holiday, offered an early opportunity for trying his new mount. After carefully examining the machine to see that all nuts were tight, testing brakes, and trying the machine on the stand, he took it on the road. Soon he was flying along, with ignition advanced, his intention being to combine the trip with a visit to Moor Farm. In a very short time he was in sight of the long hill which led up to the moorlands. He pressed down the plunger of the oil pump for the extra benefit of his new engine, and took things easy—wp-wp-wp, a two miles hill, and an engine well up to its work. The bright sunlight, the welcome signs of summer, and Kitty watching for his arrival. Leonard Gordon was indeed a lucky man. The brow of the hill was topped without the motor faltering, and a flat smooth road stretched out in front of him as far as the eye could see. With the ignition lever well forward and the throttle half open he was able to get plenty of speed, and the regular beat of the engine was pleasant to hear. Then he saw a neat, trim figure standing on the low, rough stone wall, looking in his direction. Opening the throttle still wider he was quickly alongside once again with Kitty. After affectionate greeting, Kitty's eyes wandered to the new machine. Yes, she certainly liked the colour of the paint, and all the plating looked beautifully shiny. Leonard Gordon smiled. He hoped to make her more appreciative before long. A sidecar for Kitty, and a long day's run down to the coast and back in the coming Whitsun was his programme. This he told her as they strolled back to the farm, after putting his bicycle in the barton. "Nothing could be nicer," said Kitty, "but how about father?" Leonard felt the force of the remark, but concealed it as much as he could. It was decidedly awkward. Her father must be kept good humoured. Before leaving, he managed to make a compromise with Kitty that next time he came they would make a short trip on the sidecar.

An Awkward Dilemma.

Gradually the following week passed by. Kitty was at the appointed meeting place. Seated in the sidecar, she was soon enjoying the sensations of a first motor trip. The Fates were, however, against them. On coming to a cross-way they met none other than Mr. Lloyd driving his horse and trap. Mr. Lloyd's mood was of the dangerously quiet type. He merely said he thought Kitty had better get up with him, as he was going straight home, and that they might possibly see Mr. Gordon on some future occasion. Leonard saw there was absolutely no real ground for controversy. Kitty looked pale as she got into the trap, and they drove off. Leonard felt rather small as he returned home. There was no way of doubting Mr. Lloyd's tone and manner. Opposition being the first stimulant for increasing affection, it naturally followed that they felt more than ever attached to each other. The postmen were regular callers at each of their homes. Kitty cycled over to the brow of the hill leading from the moorlands, and Leonard met her there. He had the sidecar still attached, but they both had too much to say to think of riding for some time. After a while they were disturbed by the sound of a galloping horse. The sound was peculiarly irregular, as if the horse was lame. Sure enough this was the case. Leonard then recognised one of the farm servants. Quickly going up to the man, he soon found the reason for his haste. Mr. Lloyd had dropped unconscious at the farm, and he was going for the doctor. He did not know how soon he would get there. The horse had gone dead lame. Quickly explaining matters to Kitty, he tied the horse to a gate, put the man in the sidecar, and they were seen speeding down the hill. Fortunately, the doctor was at home, and Leonard took him to Moor Farm in record time.

Mr. Lloyd is well again now. The doctor said his being able to attend him so promptly saved his life. The farmer's views on motors are decidedly modified. Best of all, he is quite reconciled to Leonard as a future son-in-law.

MONTAGU GREENWOOD.

The Motor Cycle and the Variety Stage.

HE motor cycle is used a good deal by music hall artistes both for business and pleasure. I may as well state at the commencement of this, my first article, that I am a music hall artiste and an enthusiastic motor cyclist, with the fever jolly bad, too. Not a line of *The Motor Cycle* I miss every Wednesday. A friend some time ago allowed me to try his motor cycle, and I at once decided I st have one of my own. But for a start I wanted ıething cheap to practise on. I eventually invested a 3¼ h.p. surface carburetter Rex fitted with a mo forecarriage and front wheel to convert it into a ycle. I got the whole lot for £14, although £25 ıld not have stopped me from buying it, as I had the slightest idea of the value, only that I knew tyres were worth about £8, consisting of three mer corded and one Dunlop. Mighty proud I of my first motor cycle. I was performing at mingham at the time of buying this machine. The ner owner explained to me the working of the levers, me a spin round, and then left me with the tricar.

My First Run.

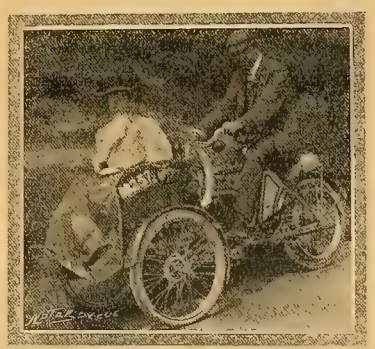
For the first run I arranged to take my sister r to Leicester, so at eight o'clock next morning started off, the motor going finely. The troubles his first trip I never shall forget. The machine ıt well for the first ten miles, when the valve lifter ke. I tied that up with string, and then the or would stop short if I advanced the spark. wever, we got within a mile of Leicester, when the ine stopped again, so I got off and started to mine it as if I had been used to motoring all my —just to impress the crowd that had collected. I spered to my passenger to go and see her people in cester, and then train back to Birmingham. She ked surprised, but went.

then had a look at the coil, and touched the nbler blade at the same time, and got a shock that t me sprawling backwards amongst the crowd, id screams of laughter. Just then a young man ne up with a look of business about him. "What's ?" he asked. Of course, I couldn't tell him, so ooked the motor over, touched this and opened that, ked the wires over, and at the finish said, "These tors always go better with petrol." What a fool as. I found a garage, filled the tank, and started k without the passenger. As the engine was not ling very well, I made for the Rex Works at ventry, and then rushed to the station in time to ch a train to Birmingham, which just got me there time to perform at the Empire. That night I nitted that the motor had mastered me. I returned Coventry next morning, and asked the Rex Company show me every test that a motor was put to when it ıld not go, and also why mine ran irregularly.

Taught Motor Cycling by a Boy.

They told off a boy about seventeen to put me right. He found out in a minute that the contact screw wanted adjusting, and that was the tiny thing that had given me all the trouble. I have to thank that boy for a lot. He taught me how to test the sparking plug, how to adjust a trembler coil, how to wire motor, how to keep terminals clean, how to grind valves, and the rest I learnt myself very quickly. My next journey was from Birmingham to London. I got along finely as far as Stony Stratford, when there was a bang, and the pulley would not move. The local garage proprietor I found to be one of the quickest workmen I ever struck. He took the engine to pieces, found gudgeon pin had come out, fixed it up, and retimed engine, all within an hour and a half, and when I started again the motor had a great deal more power. I then came to the conclusion that I had a good motor and a bargain. Having the following week vacant, I took my boy and girl three or four rides, but I could not persuade my wife to sit in the forecarriage, she being a nervous and very delicate woman. I knew that if I could once get her into motoring the saving in doctor's bills would pay for all the petrol.

My next engagement was at Edinburgh, so I made up my mind to leave London on Friday (April 19th, 1907), and get to Edinburgh on Sunday. I took the forecarriage off for this run. Starting at 11.30 a.m., I arrived at Newark at 7.30 p.m., after a splendid run. I took the accumulator to a garage to be charged, and was recognised by the attendants, one or two having seen me perform at the Empire, Nottingham. They found me a comfortable hotel, and I was shown over the beautiful old-fashioned town of Newark. Next day I started at 9.30, and arrived in Newcastle-on-Tyne at 6.30 the same evening.



On the Mumbles, Swansea. The Rex machine with forecar attached.

I met my two partners at Newcastle; one had bought an up-to-date Rex, the other a 3½ h.p. magneto N.S.U. We arranged to travel together to Edinburgh, and started on Sunday morning. It was a fine day, and we enjoyed the run, but we could not keep together, owing to tyre troubles. Then a trembler coil went wrong. Poor me, having had a couple of weeks' experience, I had to take off my coat and do all the work. My old Rex was going great guns, so was the N.S.U. Once I stopped to shorten my belt, and then started to catch them up. But it seems that after I had stopped the others waited a little further up the road, and I never saw them at the roadside, although they yelled at me. I arrived in Edinburgh at dusk, the others a little later.

The Motor Cycle and the Variety Stage.—

I have not mentioned the beautiful country towns and sea views, as this same trip has been described in *The Motor Cycle* before. My idea is to show what a grand time one can have with a motor cycle if the rider spends a few hours learning all about it.

Our next ride was from Holyhead to Liverpool, my partner with his magneto N.S.U. and myself on the

The writer, Percy Delevine, with his Rex Motor Bicycle.

Rex. After leaving the boat at Holyhead we covered the first fifty miles in two hours, including a stoppage on the Menai Bridge, and keeping to the coast road all through Wales. Then we came to a long straight stretch of road, and had a fair race, but the N.S.U. was very slightly faster than my machine, which, after all, was only a cheap three-year old. We arrived in Liverpool that evening at seven o'clock, and when I got to my apartments, who should be there but George Hackenschmidt. When he saw me he vowed he had never seen anyone look more healthy and well than I looked. We talked motors and sparking plugs, magnetos and coils, and roads until ten at night. He made up his mind to get a motor cycle after seeing me that night. If he has done so I cannot say.

Motor Cycling Improves the Health.

Our next rides were Liverpool to Bradford, Walsall, and London. Now comes the greatest thing motor cycling has done. I got my wife to ride in the forecarriage on the strict understanding that I went very slowly. I took her forty miles, and the last five miles she turned round and asked me to go a bit quicker. Needless to say, she enjoyed it thoroughly, and started with me from London for Cardiff last July. We left London at six o'clock in the morning, had breakfast in Oxford, lunch in Gloucester, and tea in Newnham. Some of the hills I met on this journey were very stiff. I had to get up as far as I could with my passenger, and let her get out and walk the rest; then I had to go back and charge up as fast as I could, and then pedal. My wife had four square meals that day—a thing that had not happened for many months. She weighed 6 st. 6 lbs. when we left London. From Cardiff we visited the following towns: Swansea, Newport, Nottingham, Leiceste Manchester, and the Peak of Derbyshire. On the la five journeys we were accompanied by Arthur Lenna and his wife on their 8 h.p. Rover car, and had not taken my wife on his car up the Peak I don't thir I should have ever got through the journey, having change of gear. Besides the journeys mentioned, all went out together nearly every day, dining in t country and returning in time for the performance night. Now my reason for writing these experienc is this: I have had my motor cycle called an old 'bu a wreck—in fact, everything that a motor could called—but if a motor cycle of any good make bought and it does not give satisfaction, it is near always the driver's fault, not the motor's. The tri described have been to my wife and self the pleasant we have ever had, and, although we have been all o the world together, we never knew what a beautif country our own was until we started motor cyclin After seven weeks on the road my wife put on twel pounds in weight, and as for being nervous or delica that's all passed. The fresh air cured her after bei ill for over three years. This may sound like a pat medicine advertisement, but, for all that, it's tr In conclusion, let me state why I always finish journeys without much trouble. I always spe Saturday oiling the motor, dressing the belts, cha ing accumulator, examining the tyres, and seeing t everything is right for the week-end. Sometimes cover 200 miles on the Sunday, and I have ne had my engine overheat. I always lift the exha valve when descending hills. I also use a great d more engine oil than other riders, and drain out crank case at frequent intervals. I carry a spare ty spare tube, inlet and exhaust valves—in fact, I le nothing to chance. I have a Roc clutch fitted n and I used it for the first time on Boat Race D

Some music-hall stars at Raglan Castle, Monmouthshire. Miss M. Delevin Harry and Percy Delevine, and Mr. and Mrs. Arthur Lennard.

when I rode from the London Coliseum to Streatha and I found it a great boon in the thick traffic. Wit clutch the sensation of a car is there, if the bulk a expense are not.

PERCY DELEVINE

QUESTION & REPLIES.

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not **must be accompanied with a stamped addressed envelope for reply.**

Paraffin Lamps on Motor Cycles.

Kindly tell me how to prevent my paraffin lamp going out every two or three minutes? A motoring friend has suggested putting a piece of cotton wool in the oil reservoir. Would this be any use? The lamp is a large one and sold for motor cycles, but although on a spring lamp bracket it goes out with annoying persistency every quarter of a mile, or even less.—H.H.B.

We are sorry we cannot help you, as we do not know a single paraffin lamp which is any use at all on a motor bicycle. Probably it is designed wrongly altogether, and will not stand a side draught.

Magneto Refuses to Spark.

I have a Rex Modèle de Luxe. At the beginning of last month the magneto failed entirely. I examined and tested it, but could get no spark, so I sent it away for repair. The front end plate was rebushed, magnets remagnetised, and the whole cleaned. It ran the engine all right when I put it on, but the moment the clutch was put in it refused to fire the charge, and after adjusting and trying for about half an hour it refused to spark at all. Plugs, cables, etc., are all in order. It seems to me it ought not to have required rebushing or remagnetising for the little work it has done. Kindly advise what is best to do with it.—Rev. H.N.

Trouble with a magneto is extremely rare, and we are inclined to think that in your particular case it may have been due to there having been something wrong with the transmission. For instance, if the chain was too tight, or was out of line, or the sprockets were damaged, it would have put an unfair strain upon the bush, and have worn it out quickly. We should, therefore, advise you to carefully look to these points. Exactly what is the matter with the magneto at the present time is hard to say, but probably there is a short circuit somewhere which can be found if you search for it carefully. Do not attempt to remove the armature. If the trouble is not evident you had better send the magneto to the makers, who will put it in order for you.

Magneto Switches.

I have a 1907 magneto Triumph, and have fitted a switch on handle-bar and fixed the wire to the screw on terminal block (15). The switch does not act. Will you please tell me if I have wired correctly, or how is it this will not put the magneto out of action?—W.M.

As far as we can tell your switch is correctly fitted up. Possibly, however, a clean form of contact is not made. You must remember that you are dealing with a low tension current. Also bear in mind that the switch short circuits the magneto, that is to say, when the wire is connected by means of a switch to the handle-bar the magneto is put out of action.

A.C.U. Quarterly Trials last week. Ready for the start.

Valve Cap Joints.

Can you give me any hints for making a really tight joint with the valve caps on my twin Minerva machine? I have tried ordinary washers, and added asbestos string and boiled oil to them, and tried the latter alone, and tried brown paper and gold size. The latter was excellent for fifty miles, but then turned to powder in spite of repeated adjustments of the cap. I can use considerable force on this machine to disengage the caps, so am not frightened of anything on account of the difficulty of getting them off again.—W.S.S.

A valve cap which is not gastight with one washer will often become so if two washers are used and the cap is tightly screwed up. Failing this, it is not a bad plan to apply fish glue round the edges. If the two faces are perfectly true and clean, a compression tight joint can be obtained without any washers at all.

Climbing Hills without Rushing.

I have some very nasty hills to mount to reach home, and must always reduce speed immediately before taking them on account of sharp corners. Partial valve lifting is bad for engine, and switching off is a strain on engine in restarting. Would you think it best to retard spark, and on rounding corner to give full advance and more gas? I ask this, as I do not know the effect on the engine of a sudden advance of spark starting uphill. In driving I am usually careful to advance gradually.—H.E.S.

If you do not care to use the valve lifter when slowing down on turning a corner, you had better close the throttle and then open it again when you have negotiated the corner. Apparently, you use accumulator ignition. If you advance the spark suddenly while ascending a hill, it is possible that you may damage the engine. In any case, it is sure to cause knocking and stop the engine.

. . The Motor Cycle for Business . .

By BAGMAN.

THE motor cycle is so often regarded as a purely pleasure vehicle that its utility for business purposes is in some quarters overlooked. Having used a motor cycle for the past six years in my rounds as a commercial traveller for Components, Ltd., I now find it an absolute necessity if I am to keep up my returns. My business requiring calls at country towns, and even villages, and only necessitating a short stay in the majority of them, it is of great importance that I should be able to call on a large number of customers per day. This is where the motor cycle scores.

A Typical Day.

Many of your readers are doubtless acquainted with Wales, and are aware that the train service in those parts does not err on the side of plurality of trains. The following example will show how the motor cycle beats the train: Leaving Chester by train at 9.15 a.m., you reach Buckley (a rising colliery district) at 9.48. The station is some distance from the town, hence it is impossible to catch the 10.50 out, so one must needs wait for the 1.15 p.m.; this brings you into Mold at 1.25. Now to reach the coast it is necessary to go back to Chester, which you reach at 4.45—too late to attempt to arrive at any of the coast towns in time for business.

"Bagman" Mr. R. T. Harman seated on his 2¼ h.p. Ariel Motor Cycle, which he uses on all his business journeys.

Compare the above with a journey by motor cycle. Buckley is reached soon after nine. Mold is only a short distance by road, and after working Mold I can get across to Connah's Quay; from there to Flint, Bagillt, Holywell, Prestatyn, and Rhyl. Total by rail two towns, by motor cycle eight, practically saving two days on this short journey alone.

Space does not allow of detailed particulars of other journeys, but your readers can readily see on reference to any but the main line trains of the leading companies that this is a day typical of many others.

Now as to the machine. All my journeys have been done on an Ariel, and after trial of several types my choice for this year is a 2½ h.p. lightweight fitted with magneto ignition and spring forks, and my experience so far is that I have a machine capable of any work to which I put it. Being light, it is easily handled, and the power is sufficient to climb any hill one meets on the main roads without pedal assistance.

Dress.

One of the disadvantages that is urged against the use of a motor cycle for business purposes is that one is apt to become bespattered with dust, mud, or oil. I have found, however, that by using a light rainproof suit of overalls, which can be easily slipped off when a town is reached, one can present quite as well-groomed an appearance as if one had travelled by rail.

Reliability

I have used a motor cycle for business purposes for six years, and only on one occasion have I had a breakdown which necessitated returning the cycle to the works, and this was entirely due to my neglect in not attending to lubrication.

Expense.

A carefully kept record has convinced me that the cost of travelling by motor cycle is just about one-third the cost of travelling by rail, and therefore not only can one save two-thirds on the railway fare, but it has also to be remembered that the motor cycle is a great economiser of time.

One of the chief points that a traveller by motor cycle has to study is to make himself thoroughly acquainted with the mechanism of his machine, and if he rides an up-to-date, well-found model this should present no particular difficulty.

LETTERS TO THE EDITOR.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Unattached Riders.

[3287.]—I shall be very pleased to send anyone desirous joining a club particulars of the Brighton and District otor Cycling Club. We offer what so many people, judging letters in *The Motor Cycle*, seem to want—all the advanges of affiliation at a nominal subscription. Perhaps Mr. itzgerald or any of his friends who may be seriously conidering the matter will kindly apply to me.

HAROLD CLIFTON,
Hon. sec. Brighton and District M.C.C.

[3288.]—I feel compelled to write you on the subject of ie A.C.U. for unattached riders. Myself, and at least half dozen motor cycling friends, would only be too willing to ecome attached for a nominal sum of say, 5s. per annum, ot that we want to participate in all its benefits, but because e believe that unity is strength, and the more powerful the .C.U. becomes the better we shall be looked after in future om the authorities. We have neither the time nor the inclinaion to join or form a club and become affiliated.

I wish it were possible for you to insert a coupon in *The lotor Cycle* asking who would be willing to become attached t 5s. per annum to the A.C.U., the coupons to be filled in nd sent to you. The A.C.U. would then very soon see what he great majority of motor cyclists thought on the subject. t will be a great pity if the C.T.C. takes this large majority.

W. A. SANSOM.

Electric Head Lamps.

[3289.]—Seeing a question in *The Motor Cycle* of the 22nd lt. asking about electric lamps for motor cycles, I thought might interest some of your readers to hear of my experince with an electric headlight. I had always an idea that he filament in an electric lamp would break with the vibraion, but seeing an advertisement in your paper of a "Glare" eadlight, I decided to try one, as it was not much to lose the thing did not act. I must say I did not expect to get nuch light, seeing that it was only using ½-ampère, but hought it would be an advantage, as I wanted to run it rom my ignition accumulator. However, I was more than urprised with the result, and during the recent holiday have un from Blackpool to Cleckheaton in the dark, and in my pinion the lamp is excellent. I did not think it possible to et the amount of light from such a small consumption of urrent.

H. BLACKBURN.

Lightweights in the End-to-end.

[3290.]—With reference to letter No. 3224 in your issue f April 8th, one is pleased to find a gentleman with such a porting spirit as your correspondent coming forward. I doubt, nowever, if he has ever been over the ground, otherwise 'Ixion's" remarks would carry more weight. I would be he last to cavil at his pluck, but to maintain the minimum peed of fifteen miles per hour will take some doing on a lightveight.

As a rider of a Fairy—a similar machine, of lower power—I intend entering for the historical event, but, having a previous experience of the course, and the class of roads and weather likely to be encountered, I do not say that the ightweight will not be able to maintain the speed limit, but I do consider it will take some doing, and I trust "W. W. D." will be able to prove the correctness of his ideas by actual results. I for one shall look forward to a large entry of lightweights, and all praise to the men who get through.

R. J. GETTING.

A Satisfied Owner of a Twin.

[3291.]—As a possessor of a 5 h.p. twin motor cycle, may I also be allowed to state a few facts concerning the same? Having ridden since last May well over 10,000 miles, I was compelled through sheer curiosity to dismantle the engine, and found everything in as good condition as if I had only been 10,000 yards. The most serious trouble I ever had was a broken mudguard stay. All brakes were in splendid order. The timing wheels and cams were beginning to look as if they might some day show signs of getting polished. I give one pumpful of oil every twenty miles. It is known as S.E. oil. I do not know who makes it, but I get it from the Addison Motor Co., of Liverpool.

I have climbed Shap with a 3 to 1 gear after a non-stop run from Lancaster. I shall never go back to a single cylinder.

REX 1906.

Sidecars.

[3292.]—Many very interesting letters have of late appeared in *The Motor Cycle* respecting the design and general handiness of the several patterns of sidecars now on the market, but no mention appears to have been made of the wearing qualities of tyres, and I feel sure the method of attachment to the cycle and design of the sidecar wheel must have some bearing on the subject.

I use a Montgomery sidecar attached to a twin Rex de Luxe, and since September last have run it about 1,700 miles.

The tyre, a 2½in. ordinary Continental, is now worn to the canvas evenly all the way round. The steering of the combination, both with and without a passenger, has always been easy, proving that the sidecar has been correctly attached to the machine, and no wear could have taken place through the wheels being out of alignment. It would be interesting if other sidecar users would give their experiences, as it is an important point in the upkeep of the combination.

J. F. POOLEY.

Overheating.

[3293.]—I have followed the discussion on overheating in your columns with great interest, and I think all really practical motor cyclists share the same opinion as expressed by your correspondent R. W. Ayton.

The engine may be excessively hot, but if you can keep up the piston speed, and the lubrication does not fail—which it seldom does—the effects of preignition will not be felt. But immediately the piston speed falls below a certain point that awful clank commences, as though the top of the piston were being struck with a hammer, which is literally the case.

Users of two-speed gears have ample proof of this. A hill a mile long or more may be climbed successfully on the low gear; but try to get into your top gear on the remaining part of the rise, however slight, and you will fail, whereas it is easily done on the descent, due, no doubt, to slightly increased cooling effect, but chiefly to increased piston speed.

Your correspondent, R. W. Ayton, has put the case very clearly, and should dispose of the question for all time.

By the way, I wonder if this gentleman is the same person to whom I introduced myself on the 14th July, 1894, at Hunningham in the middle of the river, when, at the moment of introduction, he had three feet of water above his head and about six feet of ditto under his feet? The date is correct, as shown by the Humane Society's medal. I have never seen this gentleman from that day to this; but I think by the initials it must be the same person. Anyway, I am pleased to have been of service to such an able correspondent, for, had I not been on the spot at the moment, the motor cycling world would have been the loser.

T. SLAUGHTER.

Gudgeon Pin Fastenings.

[3294.]—Talking about experiences with gudgeon pin set-screws, I had a 2¾ h.p. Stevens engined machine some years ago, and one of the screws came out and was jammed between the connecting rod and top of crankcase, thereby causing engine to seize and me to come a cropper. With all my later machines, if fitted with these screws, I take them out, and remove gudgeon pin, and hammer one end of pin on anvil, thus making it uneven. I then drive it into the piston. I have never had any trouble with a pin so treated.

DOUGLAS H. DELANY.

The Blind Leading the Blind.

[3295.]—"Subscriber" in your last issue [letter 3272] takes Mr. Ponting to task because of a statement he makes in his article, "An Easter Morning Ride."

Possibly Mr. Ponting, when he states "And numerous moles which can run very fast when they see the light of a motor cycle coming their way," really meant to say voles, as it is very unlikely that he would see a quantity of moles, but very likely that he might see numerous voles.

Nevertheless, "Subscriber" falls into a very popular error when he states that the moles in his district are quite blind. Moles are not blind, but are furnished with very small eyes which have the power of vision. These eyes are covered or surrounded with fine fur, which causes them to be overlooked by casual observers. The animal has, however, the power to radiate this fur from the eyes. If "Subscriber" will carefully examine the next mole he sees he can satisfy himself as to the correctness of my statement. R. FORTUNE.

The Motor Cyclist's Ideal.

[3296.]—Seeing the discussion in your valuable paper anent the ideal motor cycle, I venture to think that the following specification would be of interest to your readers: Built upon the lines of the four-cylinder F.N. with a disc metal to metal clutch, and a three speed gear similar to Oppermann (which is practically foolproof), m.o.i.v., magneto, hand starting, 20in. frame, footboards, Brooks pan seat, handlebar control, and such refinements as rubber studded tyres, petrol filter, gauge, etc.

Such a machine is of course not in existence, but would I think, if built, have the following points: Absolute lack of vibration, about four to fifty miles an hour speed, perfect ease of control in traffic, ability to climb any hill, and elimination of transmission troubles. The wear and tear of the whole machine would be very little.

I should be pleased to hear readers' opinions upon the above, as I think of having a machine built upon the same lines, and there may be some fault in the above specification which has escaped my theoretical notice.

I have read your paper for two years now, and look forward to Wednesday morning with a joyful anticipation, as I have always found it an immense help to me.

NIRVANA.

Brooklands Racing and Other Items.

[3297.]—In looking through some back numbers of *The Motor Cycle*, I came across a paragraph wherein a contributor suggests that a match between the two 16-20 h.p. machines exhibited at the last Stanley Show would be interesting. You agree, but remark that it would be the better plan to first find a suitable track on which to let the machines out. Surely, now that Brooklands is open to motor cycles, this would be the ideal spot, and track is no longer the obstacle.

In your issue of November 13th, 1907, there is a paragraph headed, "A New Point of Police Trap Law," which says that "police trappers must stop a car or cycle that exceeds the speed limit," and further, that "two cases against motorists for exceeding the legal limit on the Maidstone Road were dismissed on these grounds, the police, it is stated, being unable to stop the cars." In connection with this, I wish to remark that I saw in a daily paper a paragraph which says that the Sussex police are trying a new dodge to supersede the old "trap." A number of constables are stationed at various points along the main roads with a stop-watch and notebook, and simply jot down the number of every car that passes, and the time. These figures are sent to the chief constable of the county, and are then tabulated and compared, and proceedings taken against the drivers of those cars which are found to have exceeded the speed limit. A large crop of summonses are expected as a result of the experimental trials of this scheme on the Brighton Road during the recent holiday.

Now surely such proceedings cannot be legal in face of the interpretation of the law previously quoted, and taking the two cases against the motorists on the Maidstone Road as precedent would be good grounds for the defence of any unfortunate motorist who receives a summons as a result of this new system of persecution on the part of the police.

In the issue of April 22nd, 1908, I notice "A.H.W." (Canterbury) asks for information about electric lamps. I agree with your reply, and would like to add my experience. The filament of all electric bulbs is extremely delicate, both in the cold and in the incandescent state, and therefore the lamp should be sprung like an ordinary cycle lamp. A spare bulb must be carried, and this should be kept packed round lightly with cotton-wool in a box, to insulate it from vibration. If these precautions are not taken the filament will seldom last long over any ordinary road. Personally, I carried a spare as I was well aware beforehand of the delicate nature of these lamps. Although I never had occasion to use either of the spares, the filament soon proved its reputation by falling over sideways through vibration the first time the lamp was used. I used it for some five or six night rides of two to three hours each, and several other short rides of from a quarter to half an hour each. I have now discarded the arrangement in favour of acetylene for the following reasons: Filament too delicate to be reliable; light not good enough; bother and worry of having extra accumulators to keep charged.

W. SMITH.

Motor Cycling in Kumasi.

[3298.]—I have finally decided to get a motor bicycle out here to be used in connection with my business. It is necessary for me to make speedy excursions to different villages in the bush, and I am sure a motor bicycle is just the thing. The roads on the coast are excellent, and it is down there that I shall use it most. The Government are busy making several good roads out of Kumasi. Of course, I shall not use it at midday, as the heat then is too great; the temperature in the sun is then often between 140° and 150°. I do not know of another motor cycle on the coast, so that it is purely an experiment. Petrol is unknown, so the carburetter will have to be adapted to use kerosene. I consider a machine built on the following lines would be just the thing: Engine, 3½ to 4 h.p. (single or twin), a.o.i.v., magneto, belt drive 4 to 1, 2 × 2¼ Clincher-Dreadnought tyres, height of saddle not to exceed 33in., and engine clearance not to be less than 4in. What a blessing there are no "police traps" here, and one knows when to expect rain. JNO. H. GREENUP.

The Scandal of Motor Cycle Tyres.

[3299.]—How is it that after nearly ten years' experimenting the ideal motor cycle tyre has not been evolved? Wherever motor cyclists meet one hears the same old complaints and grumbles, and few if any of the much vaunted tyre firms escape without severe criticism. It is safe to say that tyre troubles cause a far greater number of stoppages on the road than all other troubles put together. Belts that give reasonable service are on the market at reasonable prices, but for that essential, a reasonably perfect tyre one looks in vain. First one tyre is boomed and then another. Novices try them and are quickly disillusioned. Punctures and bad rubber make riding miserable.

The remedy is so simple and obvious that it is nothing more or less than a crime for the factories to continue turning out new rubbish at the present rate. It is quality and quantity of rubber that is required. Given that, a tyre can be produced that will give satisfaction and be practically undeflatable at a reasonable price. If tyre manufacturers will not give the public what is required they must be coerced by the cycle manufacturers, for it is safe to say that infinite harm is done to the trade by the abominable material that is to-day palmed off as motor tyres. A pure rubber well manufactured tyre is what is required, and for it high prices will be commanded. If any cyclist would care to try an experiment let him roast a piece of his cast off tyre and note the ash of lime, oxides, and sulphides that is left behind. Poor stuff for stopping horseshoe nails.

W. E. HOLMES.

[There are tyres and tyres. We shall always be pleased to advise as to best size of tyres and a reliable make if reader will send total weight of machine and rider.—ED.]

MOTOR BICYCLES FOR SALE.

HUMBER Motor Cycle, good order; £10. —H. Morris, 2, Tower Road, Dartford.

£6.—Clement-Garrard, Longuemare, 2 h.p.—2, Verona, Landsend, Chippenham.

ANGLIAN Motor Cycles, with simplest and most practical two-speed gear. —Below.

DOUGLAS Twin Motor Cycles, the marvellous lightweight; also

SIDECARS (Mills-Fulford castor wheel), and a special selection of second-hand bicycles and tricars can be seen and tried at the London agents, H. P. Rose, Ltd., 28, Frith Street, Shaftesbury Avenue, W.

F.N., 2¾ h.p., light machine; take £14. —P., 12, Robert Street, Hampstead Road.

BRADBURY, 2¾ h.p., never been ridden; take £27 10s.— [illegible], 74, High Street, Deptford.

PHELON and Moore, [illegible] h.p., magneto, two speeds; £20.—[illegible], Vant Road, Tooting.

KERRY, 3 h.p., new last August; must sell; want cash, £15.—50, New Kent Road, S.E.

2 h.p. Motor Bike, wants overhauling; any offer accepted.—34, Leigh Road, East Ham.

ARIEL, No. 1, 2¾ h.p., very reliable; 15 guineas.—F., 16, Basuto Road, Parson's Green.

h.p. Triumph, magneto, perfect running; £25; no offers.—18, Marriott Road, Barnet.

2¼-2¾ h.p. De Dion, fast, low, reliable; good bargain; £10 10s.—13, Dermody Road, Lewisham.

3½ h.p. Triumph, 1907, magneto, perfect condition.—8, Barrett Street, Manchester Square, W.

£8 10s.—Light, low, in sound condition, 2½ h.p.; bargain.—Stored at 253, Bath Road, Hounslow.

ARIEL Quad, Dion engine, water-cooled head, spray carburetter; £10, or offer.—Kirstein, Moffat.

3½ h.p. Magneto Roc, in good order; clutch, Dunlops, etc.; £15. — 47, Station Road, Redhill.

F.N., four-cylinder, Palmer cord, 4½ h.p., little used; £35.—H., 60, Osborn Road, Palmer's Green.

WERNER Twin, 4 h.p., splendid order; £22 10s. — G., 3, Almorah Road, Halliford Street North.

F.N., four-cylinder, Bosch magneto, splendid condition; £20 cash. — Moore, Goodwood, Sidcup.

3½ h.p. Minerva, Ariel sidecar attached, both in splendid condition; £20 cash.—Buckett, Twyford, Berks.

1907 Triumph for sale, 3½ h.p., no worse than new, in splendid order; £33.—G. Teasdale, Chilton, Ferryhill.

REX de Luxe, twin tyre, magneto, Roc clutch, not ridden ten miles; £38.—G., 7, Gayton Road, Hampstead.

N.S.U., two ignitions, two speeds, 5 h.p., fine touring machine; £35.—N., 84, Drewstead Road, Streatham Hill.

SPECIAL Excelsior, 3.6 b.h.p., long, low, spring forks. — Particulars, Major Hart, Handsworth, Staffordshire.

5½ h.p. Twin Rex, good condition, spares, fast, take any hill; £20, or near offer.—Sawyer, Lyme Regis.

UNREDEEMED Pledge.—3½ h.p., splendid condition, complete; £13.—518, Kingston Road, Raynes Park, S.W.

QUADRANT, 3 h.p., 1905, excellent order, surface, Clinchers, new 1907; £16.—Foll, surveyor, Woburn Sands, Beds.

6 h.p. Twin Jap, Bat, spring frame, forks, studded back, sidecar, and spares, complete; £33, or exchange Triumph.—235, Kensington, Liverpool.

4 h.p. M.M.C. Pattern Motor, a good, sound roadster, low frame, spring forks; £12 10s., lowest.—Wauchope's, 9, Shoe Lane, Fleet Street, London.

BOOTH'S MOTOR EXCHANGE

FOR FAIR DEALINGS.

£6 and a 3½ h.p. Rex or decent machine of other make secures a splendid 6 h.p. Twin Rex, low built.

£5 and your high built machine secures a low built 3½ h.p. Rex.

We specialise in Rexes. Tempting terms for cash or exchange. Fully guaranteed.

CASH, CREDIT, OR EXCHANGE.

6 h.p.	TWIN REX, fitted with new 8 guinea Millford sidecar	£25 10
5½ h.p.	REX DE LUXE, Roc clutch, magneto, twin tyres	27 10
5½ h.p.	TWIN REX, black finish	22 10

1¾ h.p. Werner, good running order, new back tyre, spring fork attachment; must sell this week; £4. — W. Fisher, Arrow, Alcester.

2¾ h.p. Phœnix Minerva, good running order; owner gone abroad; seen at any time; best offer accepted. — 9, South Street, Isleworth.

2¾ h.p. Zedel, new Dunlops, Watawata belt, complete set of spares, splendid running order; £14 10s.—Rotom, 9, Cannon Place, Hampstead.

2⅜ h.p. Rex, good going order, low frame, spring forks, new back tyre, Longuemare, trembler; £14, or offer.—234, Belsize Road, Kilburn, N.W.

2¾ h.p. Minerva, good hill-climber, excellent condition, spare belt, accessories, spares; £15.—R. Carlisle, Old Cleeve, Washford, Somerset.

2 h.p. Werner, vertical, Advance adjustable, Palmers, Main-Hilton, less coil, otherwise running order; £6.—Lea, Gresford, Sumner Road, Harrow.

4 h.p. Roc, 1908 model, Truffault spring forks, free engine and two-speed gear, magneto, absolutely new; £45.—Walker, The Homend, Ledbury.

REAL Bargain.—3½ h.p. Humber motor cycle; £12; perfect condition, Palmer tyres, spray, trembler.—Winstanley, 84, Denton's Green, St. Helen's.

3 h.p. N.S.U., 1906, magneto, perfect condition, new Continentals and inner tubes; sacrifice £18. — Post Office, Strand-on-Green, Chiswick, W.

1907 Triumph, 3½ h.p., spring forks, lamp, horn, spares, etc., not ridden 200 miles, absolutely as new; £34. —173, Uxbridge Road, West Ealing.

h.p. De Dion Motor Cycle, long bars, spring forks, lamp, horn, stand, and carrier; trial; £14, or near offer.—Griffiths, 212, Deane Road, Bolton.

3½ h.p. Jap, low, spring frame, perfect condition, practically new; £18; will ride to intended purchaser.—Motorist, 144, Tottenham Road, Kingsland.

1907 3½ h.p. Magneto Triumph, N.A.B. spring seat-pillar, Lucas lamp, large horn, excellent condition; £28 cash, no offers.—24, St. Malo Road, Wigan.

1906 3⅜ h.p. Rex, spring forks, excellent condition, thoroughly reliable, powerful; £15 for quick sale.—A.T.S., 86, Colvestone Crescent, Dalston, London.

3½ h.p. Durkopp, 2½ tyres, ball bearing engine, trembler, spring forks, spray; £16, or best offer; splendid condition.—11, Avenue Road, Goldhawk Road.

1907 Triumph, 3½ h.p., magneto, new last August, Goodrich studded cover on back, several 1908 improvements; £32.—5, Grove Villas, Wanstead, E.

3½ h.p. Minerva, lamp, horn, stand, just as received from makers; about £27; forbidden to ride. — Greenhalgh, joiner, Gooden Street, Heywood, Lancashire.

SINGER Motor Bicycle, engine in back wheel, in good running order, £6; also Kerry, 2¾ h.p., first-class condition, tyres almost new, £13.—White, Sawbridgeworth.

3½ h.p. Minerva, low, Clinchers, 26 wheels, fine condition; £17, or entertain exchange for good push bike and cash.—9,817, *The Motor Cycle* Offices, Coventry.

£28.—5½ h.p. G.B. Motor Cycle and Sidecar, excellent condition, winner of gold medal and certificate in London to Edinburgh run.—West Kent Garage, Sydenham.

3½ h.p. Excelsior, very fast, reliable machine, good order, £12; also broad Warrior trailer, perfect condition, £3, or offers.—Postern, Sandford Road, Bromley, Kent.

MOTOR BICYCLES FOR SALE.

2¼ h.p. Motor Bicycle; £5, offers.—St. Bertha, Talbot Road, Wembley.

ROC, 3½ h.p., magneto, free engine clutch, as new, unscratched; cheap, £21.—Below.

ZEDEL, 2¾ h.p., vertical, light, low; cheap, £11 11s.—Whittle, 41, Skelbrook Street, Earlsfield.

4 h.p. M.M.C., practically equal to new; cost £57 10s.—123, Graham Road, Hackney.

1907 2-3 h.p. Minerva, spring forks, guaranteed running order; £16.—Spear, Fittleworth, Sussex.

3½ h.p. Quadrant, genuine 1906 pattern; £17.—Jakeman, 75, Hawthorne Street, Totterdown, Bristol.

4½ h.p. Four-cylinder F.N., latest, practically new; £30, lowest.—No. 9,815, *The Motor Cycle* Offices, Coventry.

2 h.p. Minerva, spray, girder forks, perfect running order; £6, or nearest offer.—34, Arthur Street, Gravesend.

BARGAIN.—2¾ h.p. Hobart, low seat, long, spray, good order, £9; good trailer, 30s.—Ewart, Draper, Maryport.

TRIUMPH Motor Cycles. — Agents, Bright and Hayles, "Camber" Motor Works, Church Street, Camberwell.

TRIUMPH, 1908, magneto, new in February, and quite perfect; £43. — 1, Grosvenor Place, Birkdale, Lancashire.

HERDTLE Brunneau Lightweight, V belt; cost 30 guineas, nearly new, £18, offers.—44, Horace Road, Forest Gate.

TRIUMPH, 1907, 3½ h.p., horn, Pulco gas lamp, not used; accept £33.—Lewington, 1, Grove Parade, Enfield Wash, N.

3½ h.p. 1907 Rex, new, never used, unsoiled, 25-guinea model; best cash offer.—1, Bank Terrace, Whitworth, Rochdale.

2 h.p. Minerva Engined Lightweight, not ridden 300 miles, good condition; best offer has it.—1, Bank Terrace, Whitworth, Rochdale.

2¾ h.p. Rothwell-Minerva, Longuemare, Clinchers, very good condition; £10.—1, Bank Terrace, Whitworth, Rochdale.

EXCELSIOR, 3½ h.p., new Palmers, long handles, low seat, handle-bar control, perfect; £12.—34, Evering Road, Stoke Newington.

12-16 h.p. Racer, grand touring machine, new; £35, cost £70; appointment.—R. Hutchison, Apsley Villa, Clapham Road, S.W.

£17.—4 h.p. Antoine, fine condition, P.U. tyres (uncut), accumulator, footboards, low, Stanley belt.—25, Morven Grove, Southport.

3 h.p. Triumph, accumulator, Fafnir, splendid condition; trial; £16 15s.—18, Ferncliff Road, Sandringham Road, Dalston, London.

2¼ h.p. M.M.C., Longuemare, foot brake, etc., beautiful condition, and reliable machine; £9.—13, Stanley Road, Earlsdon, Coventry.

3½ h.p. Rex, 1907, long bars, footboards, many spares, fast, and good hill-climber; £16. — Bond, 37, Whitehorse Road, West Croydon.

ROC, 1908, two-speed gear, magneto, H.B. control, new tyres and all accessories; £28; approval.—Tandy, Wellington Square, Crewe.

BROWN, 3½ h.p., in new condition, tyres and belt new, good reliable machine; £15.—Perry Brown, Little Hallingbury Hall, Bishop's Stortford.

3½ h.p. Minerva 1907, as good as new, not been 80 miles; £20, including spares, footrests, lamp, and tools.—Scott, 19, Clarges Street, London.

3½ h.p. Kelecom, 26in. wheels, Clincher tyres, handle-bar control, splendid order; £12 10s.—H. Hill, 70, Loughborough Road, Nottingham.

REX de Luxe Twin, black and gold, magneto, twin tyres, clutch, new January, Millford rigid sidecar; £34 10s., or separate.—56, Riverview Grove, Chiswick.

Unattached Riders. An Associates' Scheme.

WE are pleased to hear that the Auto Cycle Union has decided to organise a scheme of association for unattached riders at 5s. per head. We have constantly advocated a scheme on these lines, knowing perfectly well that if the A.C.U. did not handle the matter on behalf of motor cyclists other associations would do so, as correspondence in our pages last week and this week will show. At a recent committee meeting of the A.C.U. it was decided to hand this business over to the Relations Committee, so that full details of the scheme will very shortly be made public. The Auto Cycle Union is, of course, the motor cyclists' body *par excellence*, and we strongly recommend all riders who contemplate joining an association either for touring or other benefits to withhold their hand until the details of the scheme now preparing are made public. Whatever benefits may be derived from any other association, motor cyclists should support the Auto Cycle Union when the subscription is brought within their reach. Riders resident in London and district are strongly recommended to join the A.C.U. as full members, because, living in London, they derive many advantages from the union which are not so easily obtainable when resident in the provinces. That is the reason the subscription for London members is £1 1s. and provincial members 10s. 6d. Anyone would reasonably expect that a man who can afford to own and ride a motor cycle can afford half a guinea subscription to an organisation which is run solely for his and fellow riders' benefit. Unfortunately, everyone does not look at it in that light, and as we have previously explained, one does not always require the whole of the advantages offered at the guinea subscription. Therefore, the associate scheme will be welcomed, and we shall be very surprised if it is not the means of considerably augmenting the power—financially and otherwise—of the Auto Cycle Union.

When Doctors Agree.

IN the Spring Number last week an article "Motor Cycling for Health" was commenced. This article is composed of opinions of medical men who are actual users of motor bicycles or tricars, and the purport of this is to draw attention to the universal opinion that motor cycling is a most healthy pastime. Not infrequently one encounters a pessimist who, for reasons of his own, after urging every possible thing against motor cycling, finishes up with a statement that the vibration of a motor bicycle is bad for the health. Every rider of a modern motor bicycle knows that riding very long distances indeed is by no means uncomfortable. Even delicate and old men ride motor bicycles and enjoy riding them, too. Nothing therefore stands in the way of the cyclist who favours a motor cycle, except the first cost of the machine. Running expenses for a really good medium powered machine have been proved to be almost infinitesimal, and now that efficient motor cycles varying in power from 1¼ h.p. to 9 h.p. can be obtained, what more is wanted? We have already proved the immense amount of pleasure to be obtained from motor cycling, the reliability of the machine has been amply proved, and some business houses pronounce motor cycles indispensable. Now that doctors agree that motor cycling is a most healthy and exhilarating pastime, there is nothing to prevent the waverer who can afford a motor cycle from taking the plunge.

Our Historic Highways.

By REGINALD WELLBYE (Concluded from page 349.)

Of course, there was plenty of grumbling about the condition of the roads, particularly the Bath Road, so late as the reign of George II., but the people who suffered most did not have the repairing to do, and the parishes who did were too poor and their waywardens too ignorant to encourage any hope of improvement. A remedy was therefore sought by placing the main roads in the hands of trustees. But the grumbling still went on. People objected to have to pay tolls for the use of the King's highway, and in some parts the tollhouses and gates were pulled down and other acts of riotous violence committed.

Others who were willing to pay complained that the turnpikes took the money, but did not improve the roads. The fact was that things had got too bad to be mended very quickly, especially as there was very little known about the proper way to make up a road, and it was not till turnpikes had been in existence for many years that real reform took place. But by the end of the century the main roads had been made much better, and when the Fourth George mounted the throne, and what is looked back upon as the golden age of coaching dawned, high water mark was reached, and had there been motor cycles then the roads at least would have been no hindrance to their use, though coachmen, post-boys, and stage waggoners almost certainly would.

The high roads to-day are the roads of coaching days which have remained disused till the bicycle and the automobile came to claim them, and what they are the turnpikes made them. It was they who fixed the routes as they are now. At one time it mattered little whether a man going from London to York rode by Huntingdon, Stilton, Grantham, and Bawtry, or whether instead he passed through Buckden and Blyth and kept Grantham and Stilton on his right, but when one route became a hard turnpike road and the other remained rough and boggy it was quite another thing, and the latter was left to drovers and other folk to whom pence were more important than speed. By the same agency bends were shortened, new roads made, and old ones widened and furnished with milestones.

The Old Bath Road.

The grand breadth of the Bath Road nearly throughout is very different from its state 250 years ago. Like many other roads, before the country was enclosed, it was wide—so wide that Pepys could lose his way upon it—but the width merely consisted of three, four, or five obscure tracks abreast, formed as successive travellers had tried to find firmer ground for themselves. When, however, anything was done in the way of making it up, the carriageway was naturally, for economy's sake, kept as narrow as possible—eighteen feet, often enough. From this beggarly width the money our great-grandfathers tossed grudgingly and ill-humouredly into the pikeman's hand redeemed them. The cutting and embankments to be noted by the observant eye all along the principal roads, made to ease the trying gradients; the pumps, less frequently to be seen, that furnished water for dust-laying; and the little bits of abandoned road which often run at varying distances by the sides of the present highways they have had to make way for—all speak of an age in which comfort and rapidity of travel were being more strenuously pursued year by year. The emptiness of the now classic twenty-four hours' course, the great road between London and Edinburgh, was then very far from being dreamed of. By night and by day it was never quiet, never lonely. The quick tramp of horses' feet seldom died away for more than a few minutes, as coach followed coach and carriage carriage. The crack of the waggoner's whip, the cheerful warning notes of the coach guard's horn, and the lusty voice of the post-boy rang out with little pause on such a road of traffic as this, where the crunching of wheels went on alike in darkness as in daylight. The Dover Road, the highway that led to Plymouth, Telford's Holyhead Road—that masterpiece both of its maker and of his age—were equally full of life, and the host of other main roads throughout the country had all their part in those bustling roadfaring days.

Pump used for drawing water for laying dust on the main roads in the days of coaching. Several of these interesting relics may be seen on various main routes.

It is these associations that make our highways historic. The old life has gone, and of the generation that knew it scarcely a man remains, but the roads are there still, holding out at every mile some memory of what has been. The great cuttings near Dunstable and Petersfield are indelible, and it was not for

Our Historic Highways.—

under-powered motor cycles that they were dug, but for the relief of panting horses. We can still enjoy the straight four miles of Hartford Bridge Flats, famous among the old whips as "the fastest piece of road in England." At roadside places like Tetsworth, Stilton, or Boroughbridge, the atmosphere of the coaching age yet lingers, and an occasional petrol sign hung out before the sleepy inns cannot dispel the vision called up by the time-toned walls, the grass-grown courtyards, and the capacious yet almost empty stables—a vision of days when the place was given over to yellow-vested post-boys, many caped coachmen, stable boys, loungers, guests by the score, buxom landladies in dignified black silk, and genial hosts, whose hearty manner toned down the length of their bills. Amid such memories, among the ghosts of "Tallyhos," "Defiances," "Regents," Shrewsbury "Wonders" (ever so punctual that the rustics set their clocks thereby), "Quicksilvers" (which did the 211½ miles to Devonport in 23¾ hours), "Mazeppas," and "Telegraphs," of runaway couples in postchaises, chased by irate fathers, picturesque in periwigs and chokers, of hardy horsemen gripping at their pistols, of mounted highwaymen, and of other old-time travellers in legion, must the tourist wend his way when he fares along our historic roads.

1. The Swan at Tetsworth.
2. A village on the Great North Road.
3. Tetsworth, a typical coaching village.
4. An old toll-house near Thame, Oxon.
5. Hartford Bridge Flats on the Exeter Road, considered, in coaching days, to be the fastest stretch of road in England.
6. The chalk cutting through Dunstable Down on the Holyhead Road.

OCCASIONAL COMMENTS.

By "IXION."

Gudgeon Pins Adrift.

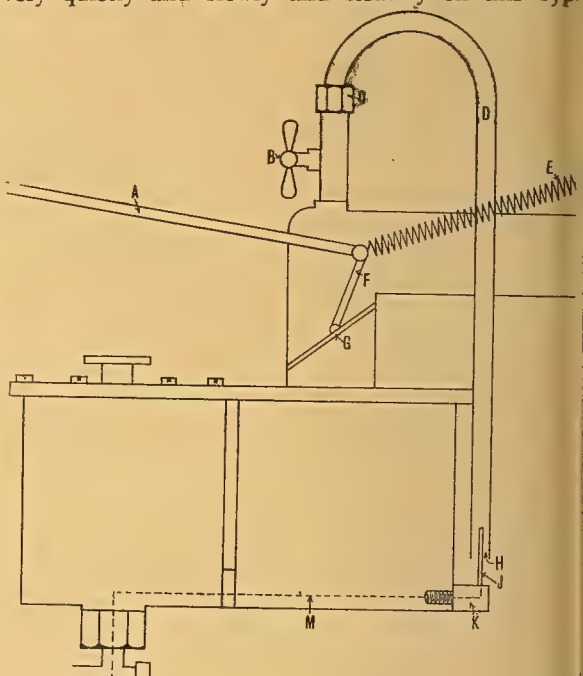
In describing how a loose gudgeon pin knocked a hole through the side of a cylinder, I stated the rider had afterwards experienced a great increase of power. I naturally put this down to the hole being just above the level of the piston at the bottom of its stroke, and so assisting the clearance of the exhaust. I am now corrected, however, and informed that the hole in one instance, at least, was below the bottom of the stroke, and that the increase of power was due to the release of crank case compression. It is only fair to say that some authorities deny the existence of any ill effects resulting from crank case compression. Still, at a certain crack hill-climb last year I saw a prominent trade rider and a prominent amateur competing with identical engines. The trade rider had made no allowances for crank case compression; the amateur had ingeniously arranged four or five release valves; and he defeated his trade rival fairly easily. This is not necessarily a case of cause and effect. The question is worth a scientific test in a laboratory.

Improvements to the 9 h.p. Riley.

A valued correspondent has sent me details of some fakes he has attached to his 9 h.p. Riley tricar, and as there are a good number of these fine machines on the road, I will give details, more especially as the points apply equally to other tricars. The first alteration concerns the front brakes. The rear brake is a metal to metal expanding. These brakes have a magnificent stopping power, but with every brake of this type there comes a day when the shoes are worn and need replacement. The worst of it is that as soon as the shoes wear beyond a certain point, the brake is absolutely useless, and that the change from high efficiency to entire helplessness may come within the limits of quite a brief run. Now we all know what tricar front brakes are—there has probably never been a tricar sold with front brakes that retained efficiency for more than 1,000 miles, and it is obviously a serious matter if all the brakes are simultaneously useless. My correspondent therefore increased the diameter of the front drums from 7in. to 11in. by fixing wooden rings over them and hooping those with iron bands, an inch wide and ¼in. thick, turning the whole true in the lathe. Iron brake bands of corresponding size, and hinged at the bottom, were then prepared, and lined with Dicks' Balata belting. Guides were riveted on the bands to keep them in register with the drums, and new fulcra provided for the operating mechanism. These brakes function magnificently, and maintain their power indefinitely. This is probably the only tricar on the road attaining the ideal of reliance on the foot-brake under all ordinary circumstances, with an immensely powerful lever brake constantly in reserve.

Fitting an Accelerator.

My correspondent has proceeded also to fit an accelerator. I differ from him in preferring to retain a hand throttle, and to use a pedal-operated valve lifter in conjunction with it. He first fitted up an extra throttle valve interconnected with the clutch, but this was not satisfactory. He then entirely removed the standard throttle lever below the steering wheel, and connected the throttle to a pedal set near the fo brake, conveniently for the right foot. The throttle closed when the pedal is up, open as it is depresse provision being made for the engine to run slowly wh the accelerator pedal is up. This is done in a curious complicated way, with manifest advantages. A copp pipe of ¼in. internal diameter is screwed into t inlet pipe between the engine and the throttle, and includes a small brass tap inset. The loose end this ¼in. pipe fits over a 2in. length of brass tube or $\frac{1}{32}$in. internal diameter. This brass pipe is screw into the cleaning orifice at the foot of the spray cha ber, and the annular space between the ¼in. and t $\frac{1}{32}$in. pipes allows the ingress of air. The device is all intents a separate self-contained carburetter w an invariable air inlet around the jet, the tap bei obviously provided to prevent suction on the separ jet when the full throttle is in use. The engine r very quietly and slowly and steadily on this byp



A. Throttle rodconnected to pedal.
B. Tap

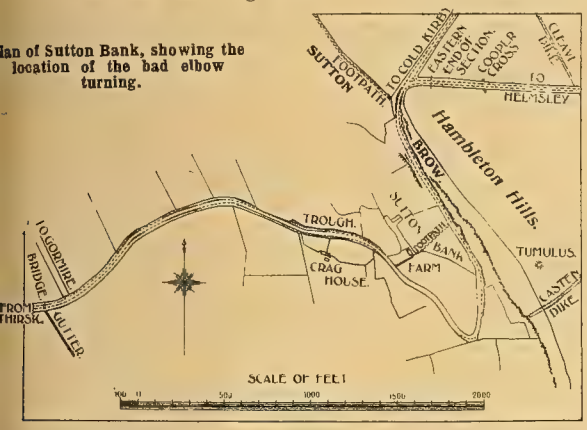
when the main throttle is absolutely shut, and it w even start on the bypass alone when free. The c buretter is a Longuemare. I must wait till I h personally handled the machine to say if this co plicated fitting is any improvement on the old pl of drilling the throttle with a hole no larger than w afford enough gas to keep the engine going. T owner says the device is practically automatic, whi a drilled throttle is not.

[Readers will be interested to know that an identi idea forms the subject matter of a patent by Imray (No. 10859).—ED.]

The A.C.U. Annual Open Hill-climb

AT SUTTON BANK, YORKSHIRE.

IT will come as a surprise to many of our readers to learn that the Auto Cycle Union has decided to hold its annual hill-climb on Sutton Bank—that famous Yorkshire declivity so ably described by Mr. B. H. Davies in *The Motor Cycle* of June 12th, 1907, page 463. Motor cyclists who intend to take part in this event or who are interested in it should refer to this article. We again give the contour sections made from the survey which was specially done for *The Motor Cycle*. For some months past the Union has been striving hard to obtain the use of a

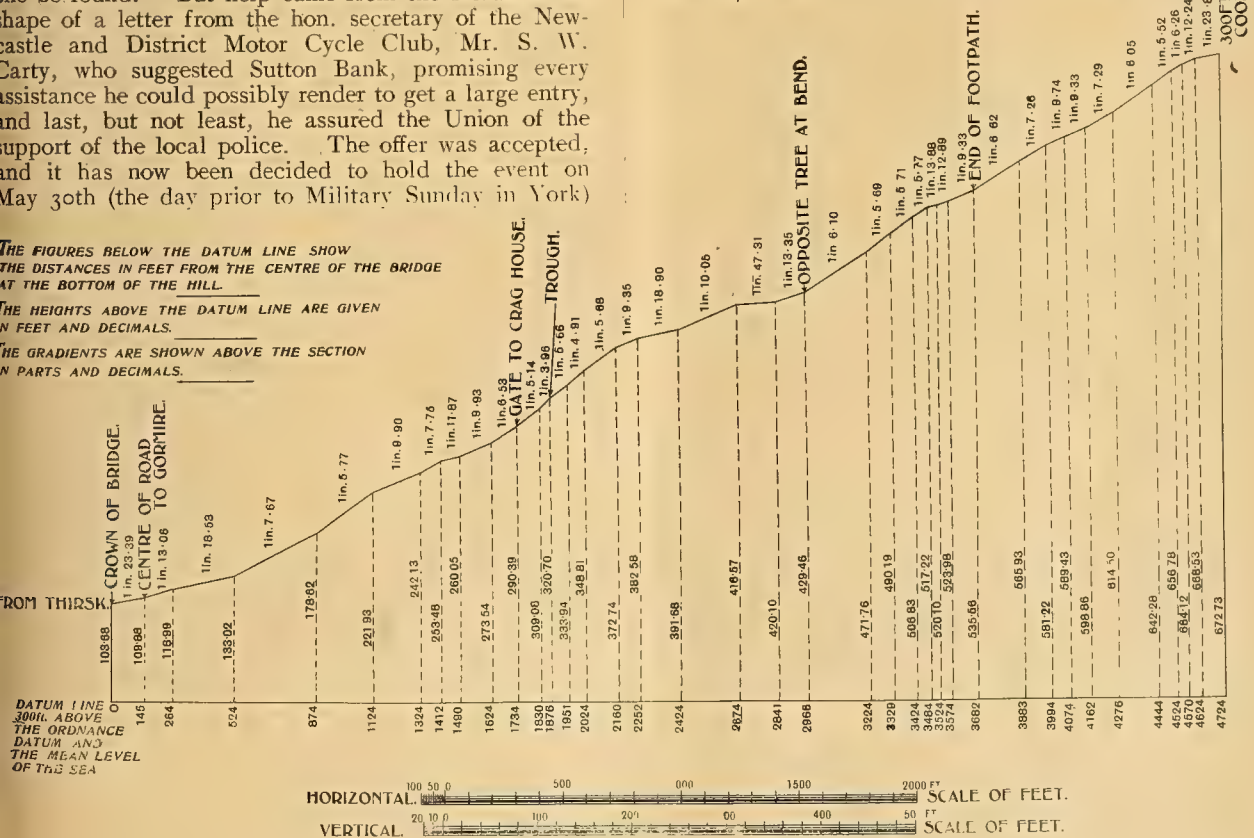


Plan of Sutton Bank, showing the location of the bad elbow turning.

hill situated in private grounds, but nowhere could one be found. But help came from the North in the shape of a letter from the hon. secretary of the Newcastle and District Motor Cycle Club, Mr. S. W. Carty, who suggested Sutton Bank, promising every assistance he could possibly render to get a large entry, and last, but not least, he assured the Union of the support of the local police. The offer was accepted, and it has now been decided to hold the event on May 30th (the day prior to Military Sunday in York) in conjunction with the Newcastle club. Sutton Bank is about five miles east of Thirsk, and is reached from London by following either the Edinburgh route *viâ* Wetherby and Boroughbridge or by going through York, the distance from London being about 200 miles. If the former route is taken York is avoided, and also the tollgate at Selby. The hill itself is most severe, and should be an excellent test. Its steepest gradient at the trough is 1 in 3.96, while 1 in 4, 1 in 5, 1 in 6, and 1 in 7 occur at frequent intervals. The length is about 200 yards short of a mile. The surface is for the most part bad, and in need of improvement, and there is one bad corner. The article referred to above leads one to suppose that a single-geared machine is of little use. If this is really the case, so much the better, as it will tend to encourage the much longed for two-speed gear. A good effect of holding the competition in Yorkshire will be to bring the northern and southern clubs more closely in touch with one another, while a number of entries from North-country riders, who will for the first time have a convenient opportunity of openly competing against their Southern and Midland *confrères*, will be welcome and acceptable on both sides.

The following classes have been arranged:

1. LIGHTWEIGHT.—For machines with engines having a cubical capacity not exceeding 350 cubic centimetres. Maximum weight of machine to be 100 lbs. Minimum weight of rider 140 lbs.



THE FIGURES BELOW THE DATUM LINE SHOW THE DISTANCES IN FEET FROM THE CENTRE OF THE BRIDGE AT THE BOTTOM OF THE HILL.
THE HEIGHTS ABOVE THE DATUM LINE ARE GIVEN IN FEET AND DECIMALS.
THE GRADIENTS ARE SHOWN ABOVE THE SECTION IN PARTS AND DECIMALS.
FROM THIRSK.
CROWN OF BRIDGE.
CENTRE OF ROAD TO GORMIRE
GATE TO CRAG HOUSE.

HORIZONTAL. SCALE OF FEET.
VERTICAL. SCALE OF FEET.

The A.C.U. Annual Open Hill-climb.—

2. SINGLE CYLINDERS.—For machines with engines not exceeding 80 mm. bore. Maximum weight of machine 180 lbs. Minimum weight of rider 154 lbs.

3. SINGLE CYLINDERS.—For machines with engines not exceeding 85 mm. bore. Maximum weight of machine 185 lbs. Minimum weight of rider 154 lbs.

4. MULTI-CYLINDERS.—For machines with twin cylinders not to exceed 76 mm. bore each cylinder. Maximum weight of machine 200 lbs. Minimum weight of rider 154 lbs.

5. MULTI-CYLINDERS.—For machines with twin-cylinders not to exceed 85 mm. bore each cylinder. Maximum weight of machine 226 lbs. Minimum weight of rider 154 lbs.

6. Open to entrants in either of the above classes.

8. VARIABLE GEAR CLASS.—Competitors to start from a standing start on lowest gear, with the rider seated on the saddle. No assistance allowed.

9. PASSENGER CLASS.—For quadcars, forecars, or sidecars carrying two passengers. Engines to have a cylinder capacity not exceeding 100 mm. bore each cylinder, or the equivalent in the case of engines with more than two cylinders.

Riders who fail to make up the prescribed weight will have to put ballast on their machines until the requisite amount is obtained.

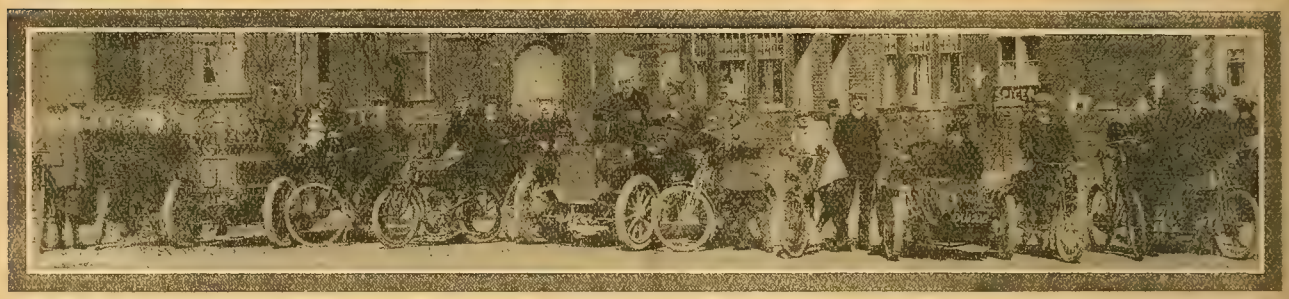
AWARDS.—Gold, silver, and bronze medals will be awarded in each class, provided there are twelve or more entries for each class.

ENTRY FEES.—10s. 6d. per machine. Members of affiliated clubs and private members of the A.C.U. 7s. 6d.

We call particular attention to the rules regarding pedal assistance and weights of riders, which we think is a most admirable feature of the competition, viz.:

PEDALLING.—No pedalling will be permitted. The machine which travels farthest up the hill without pedal assistance to be the winner in each class.

No starters' assistance will be allowed.



Some members of the Basingstoke and District Motor Club prior to the opening run of 1908.

Auto Cycle Union News.

AFFILIATION.—The following clubs have become affiliated to the Union: The South Eastern Auto Cycle Association, the Cambridge University Motor Cycling Club, the Bolton and District Motor Cycle Club, the Cambridgeshire Motor Cycling Club, the Crewe and District Motor Club, the Blackpool and District Motor Cycle Club, and the Surrey Motor Cycling Club.

ASSOCIATE MEMBERS OF THE A.C.U.—The Auto Cycle Union has at last decided to take up the matter of organising a scheme to enrol associate members at 5s. a head into the Union. At a recent committee meeting it was decided to hand this business over to the Relations Committee.

THE QUARTERLY TRIALS.—The following competitors having experienced no involuntary stops (excluding punctures) have been awarded non-stop certificates: F. W. Newsome (3½ h.p. Triumph), G. Lee Evans (3½ h.p. Rex), W. G. McMinnies (3½ h.p. Triumph), C. R. Taylor (3¾ N.S.U.), J. S. Shaw (5 h.p. two-speed Phänomen), H. G. Partridge (6 h.p. N.S.U.), F. W. Applebee (5 h.p. Rex), F. W. Applebee, jun. (5 h.p. Rex), G. L. Fletcher (2 h.p. Moto-Rêve), J. V. Robinson (1¼ h.p. Moto-sacoche), and Reginald Samson (3½ h.p. L.M.C.). The following competitors were disqualified for exceeding the minimum time: H. Newey (3½ h.p. L.M.C.), J. Beck (2½ h.p. Fairy), P. Phillips (2¾ h.p. Douglas), and W. Douglas (2¾ h.p. Douglas). All the latter earned a first-class certificate, as they experienced no trouble, but they will probably adhere more strictly to schedule time in future.

A few members of the Ayr and District M.C.C. assembled for the opening run from Burns Statue Square. The club now numbers 28.

Being the opinions of medical men who are actual users of motor bicycles or tricars.

(Continued from page 354.)

. Fox.

If a man has reached, or has not et too far passed, that milestone in ife's journey which marks his physical enith, he can adopt no pastime better alculated to preserve his strength of nuscle and of nerve than that of motor ycling. Improved circulation and deeper reathing—these invigorate his vital rgans, without that call on endurance which only still further exhausts an lready jaded brain. In short, the notor cyclist gets the benefit of hard xercise without its fatigue. From this oint of view—as a means to health— favour a well sprung lightweight. It ffords some scope for muscle, while et avoiding tension on the nervous ystem.

. 116.

(1.) Motor cycling is as healthy as ny other pastime, with the exception hat the liver gets no exercise, unless he engine refuses to fire, and then the xercise may be excessive. (2.) The notor cycle is the hardest worked and ost reliable conveyance I have, and 3) the cheapest to run with the excepion of an ordinary bicycle. (4.) With n experience of horse, motor car, triar, and motor bicycle, I would advise or a country doctor a motor bicycle for ry roads, and a motor forecar with etachable seat for wet and grease. Both machines to be of same make, .p. and gear, so that parts will be interchangeable, and essentially easy tarters.

elby Clare.

I consider motor cycling a most inigorating and healthy exercise, the dvantages of being able to go long listances, with little or no fatigue, and ee many places practically inaccessible y other means. Professionally, a notor cycle is a great boon, always eady for a journey, and never tired. Weather has no effect on motor, and ide-slip, when one is accustomed to iding in grease, is practically unnown, although I use plain tyres all he year round. Cost is a mere nothing n comparison to a horse and trap. A notor cycle costs about £1 10s. per nonth, including depreciation and verything, whereas two horses would ot do the work, and would cost £6 per nonth. The most suitable form of notor cycle is a medium weight single-ylinder, change-speed, belt drive, of etween 2¾ to 4 h.p., according to disrict.

F. C. James.

I find motor cycling a perfectly healthy pastime; the vibration is negligible. I infinitely prefer motor cycling to horse traction in fine weather, the speed is double and the cost about half. The total cost, including depreciation, has been 1.865 pence per mile, averaging 2,800 miles per year for four years. I do all repairs except engine replacements. The motor bicycle must be as light as possible, comfortable, an easy starter, magneto ignition, with rubber belt and adjustable pulley; the engine, preferably a single-cylinder, giving enough power to climb with certainty any hill in district in any weather, geared 6 to 1. A two-speed gear will only be an advantage (as procurable at present) in exceptional districts.

T. 17

(1.) I commenced motor cycling in May, 1903, and have ridden nearly every day since then, wet or fine. In moderation, and if a reasonable speed is maintained, I think the pastime a healthy one. But where much difficulty is experienced in starting a heavy motor, the exertion might be injurious. (2.) Could not do my work without it, or a motor of some sort. (3.) The cheapest method of travelling I know of. (4.) 3½ or 4 h.p., low frame, moderate weight, no pedals, magneto, belt driven (rubber), free engine. No experience of variable gears. Personally, I ride and am satisfied with a Roc.

Dr. R. W. H. Meredith, whose opinions were published on page 352 last week.

Chas. John Lathbury, L.R.C.P.

After doing all my work for five years on a 2¼ h.p. motor cycle, I have found it most decidedly healthy and invigorating, and I have never enjoyed such good health and spirits. I can do double work in half the time, and with much less fatigue than riding in a horse-driven conveyance; besides, it is of signal service for urgent messages. I should estimate the cost at least half. I would advise a 3 h.p. machine with magneto and free engine or two-speed gear.

S.J. 17.

If a doctor is not a septuagenarian, and hasn't a "top hat" practice, the motor cycle, besides being a splendid healthy sport, is capable of being of immense service to him in getting through his rounds. It is the cheapest form of locomotion I know—cheaper even than "push" cycling in view of time saved and fatigue lessened. But overalls are a nuisance. They must be worn and must be put off and on many times a day. Many visits entail many restarts, so to avoid fatigue a lightweight magneto is required. In winter I have found a single-seated Phœnix Trimo (with bonnet in front for instruments and dressings) very handy and reliable.

R. A. Slessor.

Motor cycling is a very healthy pastime. The appetite is stimulated, and as tissue waste is diminished unless exercise is taken in other directions weight goes on rapidly. Exposure is less felt than in a trap. After three years I can say that my eyesight, my hearing, my steadiness of hand, are as good as ever. The vibration bogey may be disregarded. I calculate I save £70 per annum with my motor cycle. I can go to the outskirts of my practice with a promptitude that amazes my patients, and does me no harm professionally. I have seldom failed to keep an appointment. For a young man building up a practice a motor bicycle is a most valuable asset. For this and other reasons I consider a 3½ h.p. of the best grade, and all that that implies, the ideal mount for a doctor with country work to do. Instruments, bottles, etc., are best carried in a knapsack on the back. I have done my practice for the past three years with a 1905 3 h.p. Triumph.

(To be continued.)

Preparations for the London to Edinburgh Run.

By ARTHUR W. BENTLEY.

THERE appears to be no doubt in the minds of some as to the manner of entering for the annual twenty-four hours run of the Motor Cycling Club. First of all it is necessary to become a member of the Motor Cycling Club, and prospective competitors should apply to Mr. A. Candler, of 1, Lime Grove, Shepherd's Bush, W., for an entry form and full particulars.

Assuming that the rider has entered for this popular run, the next point to be considered is the all-important question of the machine that is to carry him to victory. Any well-known make of motor bicycle is equal to a continuous run of twenty-four hours if in proper running order and properly equipped, but nothing must be left to chance. Such being the case, a general overhauling will be necessary, which should, if possible, be carried out by the competitor himself, or if he does not feel that he is sufficiently competent to undertake the task alone he should endeavour to procure the help of some friend who thoroughly understands the "tuning up" process. By so doing he will learn much that will be of assistance to him in time to come.

Overhauling Motor Bicycle not Difficult.

The whole process of a general overhauling is not a complicated matter, and as a rule merely consists in removing the cylinder, scraping away any carbon deposit that may have formed in the cylinder and the piston head, fitting new piston rings, if necessary, grinding in the valves and seeing that the springs are of proper tension, adjusting bearings, etc., and seeing that the carburetter, tank, and pipes are in order and clean. Of course, there are sundry other items that will require attention, such as swilling out the crank case with paraffin; but as a rule the above will comprise all that will be necessary in a general way. The ignition apparatus should receive careful attention and be kept scrupulously clean. Having seen to the engine, the bearings of the wheels and other parts of the machine itself should be carefully looked over and oiled, all nuts being tightly adjusted and everything generally put into ship-shape order.

The Question of Tyres.

Carelessness over the matter of tyres has accounted for more failures in these long distance runs than any other cause, and it behoves the rider to very carefully go over the tyres, and to discard any patched tubes or covers that show signs of wear, as it is exceedingly annoying, and prejudicial to his chances, to be continually held up by punctures or bursts. Concerning air tubes. Personally, I prefer butt-ended tubes, and I should carry two spare ones, as in case of puncture it is a simple matter to remove the punctured one and replace with a spare, and it takes about half the time and trouble as mending a puncture on the road, and especially is this the case if the tyre punctures in the dark. With a butt-ended tube you can wait until y reach the next control, when you can sit down comfort and do whatever is necessary, and in probability make a far better job of it.

As regards the belt, I should advise a rubber c and a spare cut to the proper length, and both of th fitted with detachable fasteners, as in case the b stretches and begins slipping or requires changing any other cause it can be replaced in a few momer Here, again, any belt shortening can be more satisf torily accomplished at the next stopping place un shelter, in warmth, and after a meal.

Lamp Reflections.

I should strongly advise a powerful lamp (as pov ful as possible, in fact), as the road may be stra to the majority, and if it turns out a wet, dark nig it may make just all the difference between comfort discomfort. A small spare lamp can be carriec desired, as it may come in handily in case of breakdc in this department. Then the all-important quest of spares. So far as I am concerned, I always ca with me a most comprehensive supply, including sparking plugs, sundry spanners (one adjustable t will fit any sized nut on machine), screwdriver, punch, two belt fasteners, puncture repair outfit, sp valves with spring and cotter complete, a small sup of nuts and screws, magneto spanner, spare magr contact breaker, files, sundry washers, etc., oilca insulating tape, some copper wire, and pair of pli They do not take up very much room, and are a g help in time of trouble. Many a time has a ri scoffed at my supply of spares before we have sta on a tour, and many a time has the laugh been on other side before the end of the run when he has hac beg the loan of one of them.

Final Preparations.

The spares should be very carefully packed to p vent damage, and after taking the machine for a f spin to see that all is as it should be we have only await the eventful day.

When the day does at last arrive it is advisable take things as easily as possible, as it is not pleas to start out on a run of 400 miles feeling dead ti after a hard day's work. Just before leaving hc for the start have a good hot supper, wrap up w procure a really good pair of goggles, put some li provender in the pockets in case of trouble on the ro carry a flask, as a little warmth in the early hours the morning is very comforting, and start out with firm intention of finishing. When you have left lights of London behind do not attempt to scorch about thirty-five miles per hour; there is plenty

Preparations for the London to Edinburgh Run.—

time. In case of an adjustment being necessary, set about it quietly, and do not start again until it is right, as a hurried repair will waste more time later on.

Provided that these elementary precautions are carried out, one can start with the sure knowledge that one is far more certain to succeed than to fail, and my advice to anybody who has not yet taken part in this run is, "Do it," you will thoroughly enjoy it.

The Cost of the Trip.

Regarding the question of the probable expense, the M.C.C. entrance fee is 5s., annual subscription town £1 1s., provinces 10s. 6d., and entrance fee for the run 10s. 6d. = £1 16s. 6d. in all. As regards the first two items, I do not think these can fairly be put down to the expense of the London-Edinburgh run, as there are numerous other advantages of being a member of this sporting and enterprising club. The purchase of any spare parts should likewise be left out of the calculations, as these must be carried on any long run.

The cost of running the machine for 400 miles—this is a point the rider must know for himself better than anyone else. At any rate, this is a very small item—2s. per 100 miles at outside. There are four meals to be reckoned—two breakfasts, lunch, and tea—say at 2s. each = 8s., and a night in Edinburgh—say 15s. at the most. Then lastly there is the return journey, which means a two days' ride. Last year I left with £3 3s. in my pocket, and when I arrived home again I had not exhausted my supply.

I think one can therefore fairly say that the whole cost of the run, excluding subscriptions, would work out at somewhere between £3 and £4, and money well spent, too. I append the route followed last year, so that prospective competitors may have ample leisure in which to study it.

A MOTOR CYCLE SPEEDOMETER.

From time to time we receive enquiries from riders who are anxious to obtain a reliable speed indicator for motor bicycles. Messrs. Markt and Co. are now turning their attention to a motor cycle pattern of the well-known Jones speedometer, which gained the highest possible awards in the R.A.C. speedometer trials held in 1906. The motor cycle speedometer is built on exactly the same lines as these successful instruments, viz., a heavy metal ring floating on steel centres mounted on and at right angles to a revolving spindle, which is connected so as to bring the indicating needle to a position in accordance with the rate of revolution of the spindle, and consequently according to the position taken by the governor ring at that rate of revolution. The mechanism is extremely simple, and unlikely to get out of order. For motor bicycles the method of drive is by friction, which is efficient and extremely simple. It will be noticed on referring to the illustration that the instrument is resting on an arm, to which it is attached by means of four screws. The driving ring is then carefully centred and clipped on to the spokes of the front wheel; this is in contact with the rubber shod ring driving the mechanism of the instrument. Our illustration shows the Jones speedometer calibrated to register kilometres per hour, but, of course, speedometers to indicate miles per hour will be sold exclusively in this country. These instruments should supply a long felt want, but it must be distinctly understood that they are well made and scientifically constructed, so that they cannot be sold at a low price; still, the price at which they are sold should be well within the range of the man who pays £50 for a motor bicycle. It is interesting to note that one of these speed indicators was used with great success by Mr. T. K. Hastings in last year's A.C.U. six days trials, while in America they are supplied to the New York Police.

The Speedometer fitted to a motor bicycle.

Mr. Reg. Samson, who made the fastest time in the Birmingham M.C.C. hill-climb on the 2nd inst. at Rose Hill, Rednal, used one of the new Lyso rubber and canvas belts made by Lycett's Rawido Belt Co., Ltd., on his L.M.C. motor bicycle. The same belt carried him successfully through the A.C.U. Quarterly Trials on the 29th ult., when he secured a non-stop award. It will be remembered that the Lyso belt has transverse grooves on the top as well as on the underside of the belt.

QUESTION & REPLIES.

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied with a stamped addressed envelope for reply.

Non-sooting Plugs Wanted.

I see in a recent issue that a rider of a twin-cylinder machine is troubled with his sparking plug in the back cylinder getting oiled up, and that you recommend a non-sooting plug, that is, one with the points protected. I should be greatly obliged if you could let me know where I could obtain these plugs, as I am troubled in the same way with the plug in the back cylinder of a four-cylinder F.N.?—F.P., Oakham.

A suitable plug for your purpose would be the L.M., sold by the United Motor Industries, Poland Street, W. These plugs are made in two forms, and we should advise you to get one of each. These two types are (1) with capsuled end, and (2) the magneto plug. We have found one of the former to be most efficient with a magneto, and practically incapable of sooting up.

Petrol Supply Impeded.

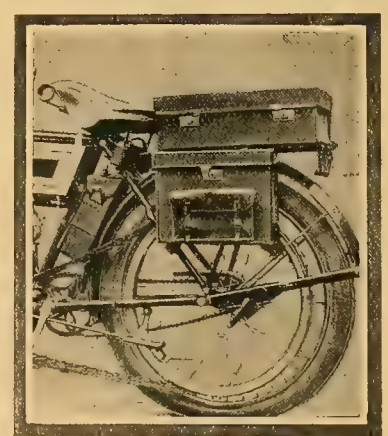
Have just had a R.O.M. contact breaker and B. and B. carburetter put on my 5 h.p. twin-cylinder Sarolea. The carburetter has been altered to take a Longuemare jet in lieu of a single jet. I use the machine with a sidecar. When it goes it is a good deal more powerful than before the alterations, but it keeps on stopping, usually just dies away. Sometimes it will go for two or three miles, at other times only a few hundred yards. It will nearly always restart after a short halt, and will invariably run well on the stand. My own idea is that it is not feeding properly, yet the carburetter and all its pipes are quite clear. Can it be the level of the petrol in float chamber is wrong; and if so, how can the correct level be ascertained?—G.W.W., Kent.

It is just possible that there is no vent hole in your tank which causes the latter to become air bound, or there is dirt in the tank, preventing the petrol flowing freely. Are you sure that the trouble is not overheating? The petrol should come up to within $\frac{1}{8}$in. of the top of the jet orifice. Remove the jet and then turn on the petrol tap when the machine is quite level, and the height to which the petrol rises can be noted. If you wish to raise the level you must slightly lower the weight which is soldered to the needle valve.

Adjustment of Trembler Coils.

The coil on my Excelsior motor bicycle is a trembler pattern. The other day I had the engine running on the stand, and it seemed to go all right, but next morning I could not get it to start. On examination I found the coil did not tremble, although nothing had been disturbed. All the connections seem to be in order. How should I proceed to rectify? The accumulator is all right. Would you recommend me to have the coil tested? If so, would you recommend a good firm, as I cannot see any maker's name on the coil I have?—C.P.

Test the circuit with a test lamp or voltmeter at the contact breaker, and so see that the current is reaching this portion of the machine. If you find that no current is reaching the coil then you may be quite sure that the fault lies between the accumulator and the coil. If the current does reach the coil, and yet the latter shows no signs of being excited, you must take out the screw and trembler blade, and clean the platinum points with a fine jeweller's file, leaving them quite smooth and flat. If you readjust the screw and there is no "buzz," you can take it that the coil is at fault, provided accumulator shows over four volts.



With the advent of the touring season, the above is interesting, showing a motor bicycle equipped with Brooks's touring outfit. The padded saddle, the belt, and the steel-studded non-skid tyre, are also by J. B. Brooks and Co., Ltd.

Ordering a New Machine.

I am giving an order for a Minerva motor cycle, and shall be glad of your help, as I am rather undecided whether to go in for a 2$\frac{3}{4}$ h.p. or 3$\frac{1}{2}$ h.p. It will be my first motor cycle. I am about thirteen stones, and rather fancy the lower power machine. Will 2$\frac{3}{4}$ h.p. be powerful enough? I thought of having magneto ignition and spring forks. Do you think the machine is built low enough? I reach a 24in. push cycle with ease.—M.A.

As you weigh thirteen stones it would be better to invest in a 3$\frac{1}{2}$ h.p. unless, of course, the country in your district is not excessively hilly, and you do not intend touring in the hilly parts of England. We recommend you to specify magneto ignition and spring forks. The frame is low, and should be just the right size for you.

A Light Tricar or Sidecar.

I wish to get either a tricar or sidecar. A friend of mine advises me to get a sidecar for the following reasons: A sidecar takes less engine power than a tricar, will keep cooler, and does not require water-cooling, will absolutely prevent side-slip, whereas the back wheel of a tricar slips about. It is easier to start, will run further on a gallon of petrol, is more sociable, and, in fact, is far preferable to a tricar unless I can afford a larger sum for water-cooling, two-speed gear, etc. He advises a 3$\frac{1}{2}$ h.p. motor cycle of good make, air-cooled, with sidecar, and says that it will take me anywhere on main roads with the help of the pedals on bad hills. Combined weight of self and wife nineteen stones. I shall be obliged if you will give me your advice, as I am quite a novice, and if I make a mistake and get a bad machine it will have to be goodbye to motoring.—S.E.H.

Your friend's advice seems to be quite sound. However, without a two-speed gear the machine could not be expected to go up every hill you come across, but if you have the bicycle geared properly (*i.e.*, not over 5 to 1), and are not averse to assisting with the pedals on steep hills, a great amount of fun can be got with a 3$\frac{1}{2}$ h.p. bicycle and sidecar attachment. Use an extra strong belt for passenger work.

Feeble Firing in Front Cylinder.

I shall be obliged if you will help me in a difficulty with my 5 h.p. Peugeot. Although the machine is quite a fair hill-climber, the front cylinder seems to do very little work in comparison to the back. When I depress the inlet valve plunger in front cylinder the back cylinder continues firing steadily, but if I depress plunger on back cylinder the front only fires a few times feebly, and it fires back to the carburetter. I have ground valves in carefully and fitted new washers and tested compression with oil, but can hear a blowing out in front cylinder. I cannot find out where it is. If you think there may be a blow-hole or cracked exhaust valve seating please let me know where I could get same repaired. The blowing out is only slight, and ought not to make such a difference in the power of the two cylinders. I have fitted new exhaust valve springs and have got inlet valve springs of equal tension. Carburetter is quite clear.—A.M.C., Leicester.

Very often with a twin-cylinder there is a difficulty in getting both cylinders to fire evenly. Probably the inlet pipe union or the valve itself is not a gas-tight fit. In this case you will get a leakage which would account for the noise you hear. Spread oil around all the joints of front cylinder and look closely for small bubbles when testing the compression. A slight loss of compression will mean decreased power. You should also be very careful to see that both inlet valve springs have the same tension. If, on the other hand, the trouble is due to a cracked inlet valve seating, the only cure is a new cylinder. It is also possible that one cylinder gets more oil than the other, and it may be that the front one will require new piston rings. The blowing you hear is most likely a leakage past the valves. See the experience of "F.J.," Middlesbrough, on this page.

The "Best" Sidecar.

Will you give me your opinion or advice upon which is the best sidecar to use with my two-speed 5 h.p. Rex de Luxe? There seems to be so much difference of opinion that I am quite at a loss to know which to embark upon. I want to know the best, combining ease of steering, attachment, and absence of skidding.—E.W.B., Birkenhead.

We regret we cannot tell you the "best" sidecar. The choice of a sidecar is chiefly a matter of personal taste. If you can drive a tricycle and like a rigid sidecar you cannot do better than purchase a Chater-Lea or Mills and Fulford. If you must have an attachment that can be attached and detached in one minute, and can be steered easily by any cyclist, then the flexible type made by W. Montgomery and Co. will suit you.

Vivian Olsson (5 h.p. Vindec) nearing the finish of Sharpenhoe in the M.C.C. members' competition.

Amount of Play in Bearings.

(1.) Is it correct for a piston to have a certain amount of side movement (when cylinder is detached) on its rod? (2.) Also when the engine is pedalled on the stand, or when the pulley is turned backwards and forwards by hand, there is a very slight clanking sound (it is not the valves). I think it must be when the piston changes from upward to downward movement, or *vice versa*. It sounds as if the rod had a little play on its pin, and taps against the pin when the direction of rotation is changed. Do you think this is all right? I suppose there must be a certain amount of play, otherwise the rod could not work freely.—R.C.

(1.) A slight amount of side play is quite necessary, but no vertical play, either on the gudgeon pin or crank pin, should be permitted. (2.) The clanking may be due to the tappets which raise the valve knocking against the rocking arms, that is to say, that the noise is not necessarily the valves, but it may be the valve gear. On the other hand, if there is any play in the piston rings, gudgeon or crank-pin bushes, they should be renewed as early as possible.

READERS' REPLIES.

Leak of Compression causes Hissing.

During a long run at Easter I found out what had puzzled me for some time, viz., the cause of a constant hissing whilst the engine was running. At first I thought of leakage through sparking plug or valve caps, but on tightening these up there was no improvement. Later I examined exhaust valve and found it pitted very much. When valve was reground the hissing disappeared.—F.J., Middlesbrough.

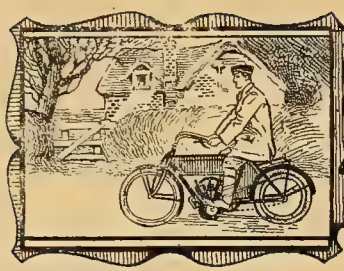
Overheating and Loss of Power.

I see by your issue of April 22nd that F. T. Kent is troubled with overheating and loss of power with a 3½ h.p. Brown. I had an exactly similar experience with the same make of machine during the first two months it was in my possession, and after tinkering with it in every conceivable way, and having almost made up my mind to return it to the makers, I absolutely cured the trouble by opening up the holes in the silencer. Hoping this information may be of use to your correspondent.—Dr. P. M. Moore.

How to Prevent Explosions in Silencers.

In your issue of the 29th "F.M." asks, "How to prevent explosions in the silencer?" and with a view to finding a remedy for such unpleasant noises I have experimented while driving my little 2 h.p. Minerva, and can produce and prevent explosions at will by the following means: When the machine is running well, and mixture and all else is apparently correct, I get explosions in the silencer if I lift the exhaust, and a louder one immediately I drop it. When I switch off the current and lift the exhaust, and then switch the current on, I get explosions, and should I at the same moment or later drop the exhaust I am certain of one or more loud reports from the silencer. But when I switch off and lift the exhaust at the same time, and wish to start again without noise, I drop the exhaust and allow the engine to make a couple of revolutions before I switch on the current. This plan has not failed with my engine, and I must say riding is much more pleasant now that it is possible for me to drive for a half-day and not once get an explosion in the silencer. If you think this may be of service to "F.M." I shall be glad to see it published. I always like my little experience and experiments to be of use to others as well as to myself.—Frank H. Stevens.

"THE AUTOCAR" contains each week much interesting information which, although written in regard to motor cars, is also applicable to tricars and motor bicycles. It is published weekly, price 3d., and can be obtained from all newsagents and bookstalls.



CURRENT CHAT.

SPECIAL FEATURES.

PREPARATIONS FOR THE LONDON TO EDINBURGH RUN.

THE A.C.U. ANNUAL OPEN HILL-CLIMB.

MOTOR CYCLE HANDICAP AT BROOKLANDS.

The Spring Number.

We beg to thank those of our readers who have congratulated us on the excellence of the Spring Number.

American Riders in the End-to-end.

Mr. Oscar Hedstrom, of the Hendee Mfg. Co., America, who signified his intention of competing in the A.C.U. End-to-end Ride, fears that owing to pressure of business he will not be able to compete, or send anyone over for that purpose.

Tour de France Reliability Trials.

A good number of motor bicycles and tricars are competing in the Tour de France Trial of the French Auto Cycle Club. Competitors left Paris on Monday last, and will visit during the week Dijon, Clermont-Ferrand, Limoges, Bordeaux, Tours, and Paris, a total distance of 1,600 kilometres—993½ miles. Among the well-known makes of motor bicycles in the quarter of a litre class may be mentioned the Quentin, Alcyon, Lurquin-Coudert, and Peugeot. An engine of a quarter litre capacity is equal to a bore and stroke of 64 by 70 mm., which is the size of the 1¾ h.p. light-weight F.N. In the light-weight class there are Alcyon, Griffon, and Werner machines. The tricars, with the exception of the Ronteix, are of new makes and practically unknown to English riders. They include such names as Furan, Soureau, Berujeau, etc. The list of successful competitors will be given in due course. They arrive back in Paris next Sunday.

Brice on the Warpath Again.

In the Sharpenhoe Hill-climb on the 2nd inst.. R. M. Brice, on his 3½ h.p. Brown, made the fastest time of the day, excepting that one twin-cylinder machine beat him by two fifths of a second. He used Dunlop tyres on his machine.

The Output of Sidecars.

Sidecar attachments appear to be most popular, judging from a letter we have received from W. Montgomery and Co., which states that they recently despatched in a single week no less than twenty-seven of their flexible pattern sidecars.

Motor Cycle Club for Nottingham.

Mr. E. G. Young, Trent Bridge, Nottingham, writes that the organisation of a club for Nottingham and district is proceeding satisfactorily. In our next issue we expect to be able to announce particulars of the first meeting, giving time and place.

Germany's Trade in Motor Cycles.

During the first quarter of 1908 Germany imported 104 cwts. of motor cycles against 101 in the same period of last year, but the value remained the same. Belgium and Austro-Hungary supplied the bulk of these, the former selling 66 cwts. and the latter 20. Still comparing like periods for the two years, Germany's sales abroad dropped from 992 to 796 cwts. Great Britain, however, bought almost as much as before, her purchases reaching 280 cwts. against 286 in January-March, 1907. But Holland's purchases fell from 100 to 10 cwts., and Denmark's from 212 to 134 cwts. The state of the automobile trade in Germany leaves much to be desired; the figures for cars and industrial vehicles are as unfavourable as those here cited.

Motor Cyclists' Ideal Road.

A start has already been made tarring the Folkestone Road. By early summer the whole of the road from London will have been treated. Thirty tar-spraying machines have been purchased for use in Kent.

Essex M.C. Open Hill-climb.

This hill-climbing competition takes place at Lippett's Hill, High Beech, on Saturday next, the 16th inst. There are five classes in all. A unique handicap has been arranged in the motor cycle classes which should prevent the usual grumbling at a competition of this nature.

FUTURE EVENTS.

May 14—Finchley Harriers' First Motor Cycle Race at the Stadium.
" 11-17—Auto Cycle Club of France Reliability Trials.
" 16—Essex M.C. Open Hill-climb at Lippett's Hill, High Beech.
" 30—Auto Cycle Union Open Hill-climb on Sutton Bank, Yorkshire.
June 5-8—M.C.C. LONDON-EDINBURGH RUN and return for Schulte Cup Competition, and special cup for motor bicyclists.
" 6 and 8—Brooklands A.R.C. Whitsun Meeting.
" 20—Entries close for M.C.C. Team Competition at Daventry.
" 27—M.C.C. INTER-TEAM TRIALS for "The Motor Cycle" Fifty Guineas Challenge Cup. Prospective competitors: Motor Cycling Club, Coventry M.C., Great Yarmouth M.C.C., and Birmingham M.C.C.
" ——A.C.U. 24 Hours' Ride.
July 4—Essex M.C. Open 200 Miles Non-stop Run.
" 4—Brooklands A.R.C. Meeting.
" 6-7—A.C.F. Grand Prix Races for Cars.
" 13-18—A.C.U. LAND'S END TO JOHN-O'-GROAT'S SIX DAYS' RELIABILITY TRIAL.
" 14 and 15—M.C.U.I. (Ulster Centre), Open 400 Miles Reliability Contest.
" 25—Motor Cycling Club's Petrol Consumption Tests.
Aug. 3-4—M.C.C. Run from London to Land's End and Back for Charles Jarrott Cup.

Savage Southampton.

A local reader in sending us a list of motorists recently fined at Southampton for exceeding the speed limit, says he would advise all motor cyclists to avoid Southampton and district for the next few months. We regard his advice as sound, seeing that eleven motorists who were summoned paid fines amounting to £40 10s., not including costs. The trap is in Winchester Road, and a quarter of a mile in length.

Repairing Petrol Tanks.

"F.W." writes warning others not to attempt any soldering on a petrol tank without using the utmost precautions. He recently took an old tank out of a motor cycle frame and then swilled it out thoroughly with water several times. After allowing it to stand for about twenty hours so as to clear off any gas or vapour, he commenced operations with a soldering iron, but he had hardly got the metal nicely flowing when there was a terrific explosion which blew the tank side out. Fortunately for "F.W." the force of the explosion was spent downwards and he suffered no personal harm, but the experience should be noted by tank repairers.

The M.C.C. London-Edinburgh 24 Hours Run.

The time for sending in entries for the above popular run has now arrived. Starting from Highgate at 10 p.m. on Friday June 5th, competitors who reach Edinburgh within twenty-four hours will receive gold medals and those arriving within third hours will be awarded a silver medal. Regarding the return journey, the Schulte Cup is for competition among drivers of motor cycles and cars, the catalogue price of which does not exceed £250 complete. The M.C.C. challenge cup is for motor bicyclists only.

A Projected Long Ride.

Just as Lieut. Edward Noel was on the verge of his departure from Bombay for England by motor bicycle, he was stopped by the Government on account of the succession of robberies and murders in the country through which he had proposed to travel. He has therefore had to omit the first 500 miles of his trip, and proposes to start somewhere in Palestine, probably Haffer, thence his route will be through Jerusalem, Damascus, Aleppo, to Constantinople.

Snowed up in the New Forest, between Ringwood and Romsey, April 26th. *Photo by H. D. Crook.*

lice Traps.

We are informed by a correspondent at motorists are being timed on the ath Road between Atworth and Shaw, d he strongly recommends the A.A. send scouts to deal with the matter. There are also two traps on the psom Road, one a mile from Ewell oming from London), the other be- veen Ewell and Epsom.

Alteration in Motor Taxes.

A reduction in the Inland Revenue x, wished for by motor cyclists, is ot to be. The present tax of 15s. on otor cycles, also the absurd extra tax 15s. on attachments such as the riel coupler and trailers, remain un- tered, as the subject of motor taxa- on was not mentioned in the Budget.

tor Cyclists' Congress on the Rhine.

On May 28th the German Motor yclists' Association, founded on May th, 1903, at Stuttgart, and which has w some 13,000 members on the roll, lds its general meeting at Bingen. here will doubtless be a big crowd at e congress, as the Rhine district is e on which the German people may stly pride themselves.

tor Union Visit to Bournemouth.

The tenth provincial meeting of the otor Union will be held at Bourne- outh on Saturday, May 23rd. The eneral Committee of the Union will eet in the morning under the chair- anship of Mr. W. Joynson-Hicks, .P., at the Municipal Offices, at the vitation of the Mayor and Corpora- on. An interesting programme has en arranged for the afternoon, and e tenth provincial dinner will be held the evening at the Hotel Mont Dore.

Cudham Hill Doomed?

There is a prospect, we hear, of the ngerous bend at Cudham Hill being moved by the local authorities. If , the ascent will lose some of its verity, and might even be impractic- le for hill-climbs, as the pull up past e top leading to the churchyard and rch entrance to quaint old Cudham urch is short. At the same time, we nsider it questionable if the parish ill go to the expense of the improve- ent, as the road is practically disused ordinary traffic.

Motor Cyclist and Lawn Tennis Champion.

In last week's *Tatler* a capital photograph appears of Mr. A. F. Wilding, present holder of the covered court tennis championship, mounted on a F.N. motor bicycle, on which he has made extensive tours both in England and on the continent.

The Suggested Sidecar.

The inventor of the sidecar attachment described in *The Motor Cycle* of April 22nd, page 311, under the title "A Novel Sidecar Attachment," informs us that the idea is fully protected. Anyone wishing to use it can be put into communication with the inventor if he addresses a letter "Novel Sidecar," c/o the Editor.

Rubber Studded Tyres.

It is not difficult to notice that rubber-studded tyres on motor cycles have quickly jumped into popularity. They undoubtedly minimise the risk of side-slip greatly. At present there are two patterns on the market, the Shamrock-Excelsior and the Goodrich. We have used both makes on our own machines for several hundred miles, and consider them excellent.

Imports of Motor Cycles.

The Board of Trade returns show a gradual falling off in the imports of foreign motor bicycles. 160 complete machines were imported last month, as against 241 in April, 1907. During the four months ended April 30th, 627 motor bicycles were imported, as against 744 last year, and 805 in 1906. The values, together with parts, were £23,283 (1908), £32,208 (1907), and £32,561 in 1906.

Exports of British Machines.

British exports again show an improvement. Eighty-seven complete machines were despatched from this country during April, fifty-one last year, and sixty-one in April, 1906. From January 1st to April 30th, 271 machines were exported this year, 224 in the corresponding period of 1907, and 255 in 1906. Together with parts, the total values were £17,787, £18,297, and £16,980 respectively. £3,024 represents the value of foreign motor cycles and parts re-exported from England during the first four months of the present year.

A Long Day's Ride.

Newcastle-on-Tyne to Wokingham (Berks) is a matter of 300 odd miles. This distance was accomplished in 13¾ hours during Easter by a rider of a 1908 Triumph, who wished to visit his friends for the holidays. One hour was occupied for luncheon, which reduces the time to 12¾ hours, or an average of about 23½ miles an hour. We see no reason why such a performance should not be made public provided due care was displayed in passing through towns and villages, and we understand that time was made up on deserted stretches where no inconvenience or risk of accident to other road users was likely to occur.

Loss of a Motor Coat.

A case not without interest to motor cyclists was heard at Newark recently. Mrs. Waterfall, of Whitwell, sued George Baines, Ossington Coffee Palace, Newark, for £5, the value of a motor coat alleged to have been taken from a car in the Ossington garage whilst plaintiff and her husband were having tea in the house. After tea Mr. Waterfall returned to the car to get some paraffin oil for his tail lamp. The coat was then noticed in the car, but on returning again a short time afterwards the coat was missed. The judge held that after having his tea and going to the car for his lamp and oil Mr. Waterfall took possession of his car, and that the coat was lost after taking such possession. Judgment was, therefore, for defendant with costs.

Motor Cycling for Ladies.

With regard to the article "Motor Cycling for Ladies," published last week, Miss Muriel Hind rode from Coventry to Wareham, Dorset, on Saturday last *viâ* Oxford, Reading, and Winchester. The distance is approximately 160 miles, and this ride was accomplished with ease and comfort in about eight hours. The advantages of the free engine clutch fitted to the 5 h.p. Rex were exemplified at various awkward corners, particularly in Winchester, where there is a nasty turning to negotiate, which might present difficulties for a clutchless machine handled by a lady. Miss Hind's longest ride on this machine totals about 200 miles in the day.

Leeds M.C.C. Hill-climb on Beulah Hill. Some of the competitors at the start. The winner, Mr. A. B. Hughes (4 h.p. N.S.U.), is second from the left.

The Second Motor Cycle Race at Brooklands.

FOR the second time the motor cycle race at Brooklands was one of the most appreciated events of all those which took place at the meeting on Saturday last. In a motor cycle race there is something irresistibly attractive, which keenly interests the public. To our mind, the riders appeared to be travelling faster than many of the cars, and the number of entrants (thirty-one), all of whom started, rendered the race particularly exciting. On the race card the event was down as follows: 3.45 p.m. The Motor Cycle Handicap Plate of 25 sovs. (The entrant of the winner to receive 15 sovs., the entrant of the second 7 sovs., and the entrant of the third 3 sovs.) For motor bicycles of which the engines, if twin-cylinder, do not exceed 85 mm. by 95 mm. for each cylinder.

The engines of the machines entered varied from the 7 h.p. twin Peugeots of A. G. Forster (7 h.p. N.L.G.-Peugeot) and E. Kickham (7 h.p. Leader-Peugeot, 82 by 90) to the tiny single-cylinder 70 by 70 1¾ h.p. K.D. entered by A. C. Wright. Among the well-known riders we may mention W. Genn (7-8 h.p. Minerva, 80 by 95), F. Toman (4½ h.p. Laurin and Klement, 75 by 85)—the other L. and K. was the identical machine which competed so successfully in the International Cup Race in 1905, 7 h.p., 80 by 100—W. G. McMinnies (3½ h.p. Triumph), M. Geiger (6 h.p. N.S.U.), W. H. Wells, A. Sproston, and A. G. Reynolds (5 h.p. Vindecs, 75 by 76), T. H. Tessier (6 h.p. Bat, 76 by 95), R. M. Brice (3½ h.p. Brown, 82 by 90), G. Lee Evans (3½ h.p. Rex, 82 by 90), G. Aldington (3½ h.p. Kerry, 68 by 72), and A. C. Wright (1¾ h.p. K.D.), whom we were pleased to see again on a motor bicycle.

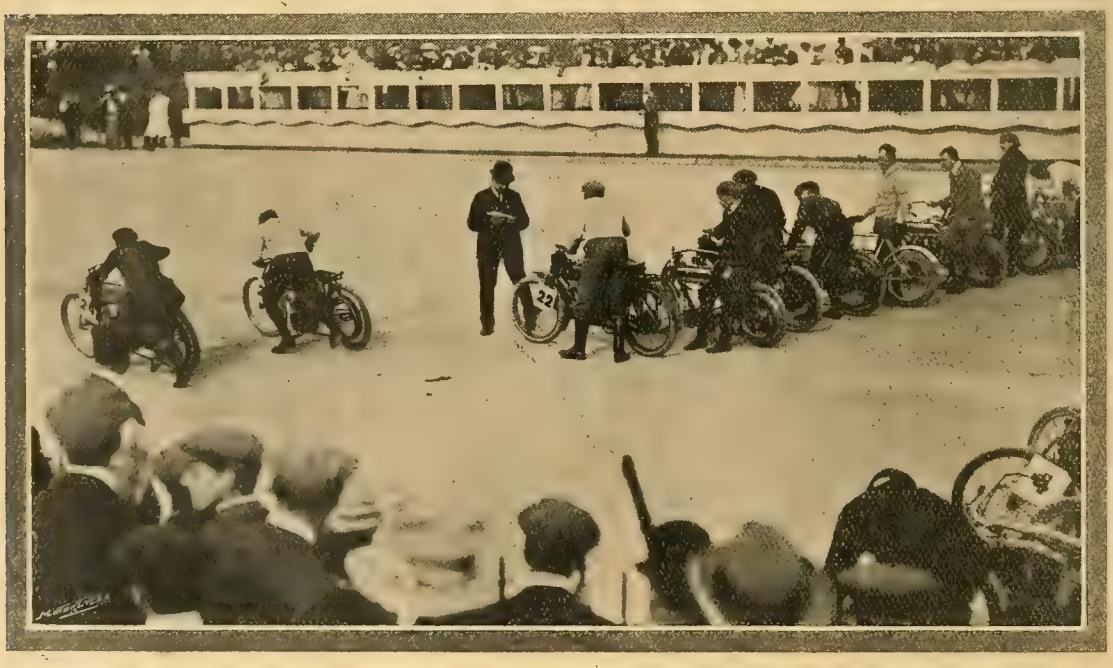
The thirty-one machines lined up near the timing box made an imposing spectacle, and nearly all made a good start. The length of the race was about five and a half miles, the machines passing the fork once and then entering the straight. Once started, the race was hard to follow, but at the completion of the circuit it was interesting to see the riders streaming along the course under the bridge, the scratch men rapidly overhauling the lower-powered machines.

In the paddock at Brooklands. Preparing for the Motor Cycle Plate. Out of an entry of thirty-one competitors every one came to the post.

Talking with one of the competitors after the race we were told that the wind was most trying during tha part of the race where it blew in the teeth of the com petitors, and also that there is no necessity to tak the banking.

Handicap Results.

The following is the result of the handicap: (1 H. Shanks (2¾ h.p. Chater-Lea), 2m. 45s. start, tim 7m. 48s.; (2) H. G. Partridge (6 h.p. N.S.U.), 1m 45s. start, time 7m. 51s.; (3) W. H. Bashall (3½ h.p Triumph), 1m. 40s. start, time 7m. 56⅕s. The fastes speed attained was fifty-eight miles an hour. Th



Start of the Moto Cycle Handica Plate of 25 sovs. o Brooklands Trac Saturday last, Ma 9th. Great intere was displayed i this event, an there was a exciting finish b tween second (M H. G. Partridg 6 h.p. N.S.U.) an third (Mr. W. H Bashall, 3½ h. Triumph). Les than a whe separated thes two riders.

The Second Motor Cycle Race at Brooklands.—

2¾ h.p. Chater-Lea was a particularly neat racing machine, being well designed, light, and efficient, while the N.S.U. ridden by Partridge was the identical roadster machine he rode in the last quarterly trials.

Brooklands Second Motor Cycle Race. Mr. H. Shanks, Jun. (2¾ Chater Lea, 75 x 75 mm.), winner of the handicap with a start of 2 mins. 45 secs. Time, 7 mins. 48 secs.

The following came next in order (after each machine the amount of handicap is given): M. Geiger (6 h.p. N.S.U.), 1m. 25s.; H. A. Cooper (3½ h.p. Triumph), 2m. 35s.; F. G. Andræa (5 h.p. Rex). 1m. 45s.; T. H. Tessier (6 h.p. Bat), 1m. 35s.; A. Sproston (5 h.p. Vindec), 1m. 30s.; G. Lee Evans (3½ h.p. Rex), 1m. 50s.; W. G. McMinnies (3½ h.p. Triumph), 1m. 25s.; F. Toman (5½ h.p. Laurin and Klement), 40s.; R. O. Clark (4½ h.p. F.N., four cylinders), 1m. 50s.; W. Pershke (4 h.p. Diamond), 2m. 10s.; R. Mundy (3½ h.p. Triumph), 2m. 35s.; R. M. Brice (3½ h.p. Brown), 1m. 50s.; G. L. Fletcher (2 h.p. Moto-Rêve), 3m. 20s.; W. E. Cook (7 h.p. N.L.G.), scratch; E. Kickham (7 h.p. Leader), 20s.; B. C. Lamb (4½ h.p. F. N., four cylinders), 1m. 50s.; J. Merfait (7 h.p. Laurin and Klement), scratch; W. Genn (7-8 h.p. Minerva), 20s.; and A. G. Reynolds (5 h.p. Vindec), 1m. 35s.

Among the unfortunates were Wells, who punctured; A. Mayer (7 h.p. Buchet), whose belt came off; A. C. Wright, whose number plate fell off, caught in his front wheel, and threw him; and H. P. Beasley (5 h.p. Rex), trouble with crankshaft bearing.

The weather was gloriously fine, and a good number of spectators were present. The following officials assisted at the motor cycle race: Mr. A. V. Ebblewhite, circuit counter and starter; Mr. F. Straight, handicapper; while among the members of the A.C.U. committee there were to be seen Messrs. H. P. E. Harding, H. G. Cove, and E. M. P. Boileau.

M.C.C. HILL-CLIMB AT SHARPENHOE.

The result of the handicap for motor cycles at the M.C.C. Sharpenhoe hill-climb on May 2nd is as follows:

CLASS I.—For single-cylinder motor bicycles with engines of any capacity.

Position.	Rider and machine.	Points.
1.	R. M. Brice (3½ h.p. Brown)	75.0
2.	W. A. Sale (3½ h.p. Rex)	76.2
3.	C. C. Cooke (3½ h.p. Phœnix)	82.5
4.	J. P. Le Grand (2½ h.p. Matchless-Jap)...	86.5
5.	C. Gibbons (3½ h.p. Deacon-Minerva) ...	91.9
6.	W. A. Jacobs (3½ h.p. Rex)	94.7
7.	J. Stuart White (1¼ h.p. Motosacoche)	97.8
8.	Percy H. Trotman (3½ h.p. Triumph) ...	110.1

CLASS II.—Twin-cylinder motor bicycles with engines of any capacity.

1.	S. G. Frost (4½ h.p. Minerva)	90.4
2.	Owen L. Summers (5 h.p. Vindec Special)	94.2
3.	W. H. Wells (5 h.p. Vindec Special) ...	101.1
4.	Edward Pond (5 h.p. Vindec Special) ...	101.7
5.	C. H. Barfield (5 h.p. Vindec Special) ...	102.0
6.	S. H. Fry (5 h.p. Vindec Special) ...	105.4
7.	Vivian Olsson (5 h.p. Vindec Special) ...	105.9
8.	A. S. Phillips (5 h.p. Vindec Special) ...	106.8
9.	Miss Muriel Hind (5 h.p. Rex)	107.1
10.	Frank White (5 h.p. Rex)	114.7
11.	Chas. J. Seed (5 h.p. Vindec Special) ...	114.9
12.	W. A. Sale (5 h.p. Vindec Special) ...	115.6
13.	A. G. Reynolds (5 h.p. Vindec Special)...	123.7
14.	T. F. Fox (5 h.p. Rex)	129.9
15.	Will Pershke (3½ h.p. Diamond)	162.5

CLASS III.—Passenger motor cycles.

1.	A. F. Ilsley (5-6 h.p. Phœnix Trimo) ...	115.3
2.	E. W. Brewerton (10 h.p. Lagonda tricar)	125.5

The times were given in *The Motor Cycle* of May 6th (page 362). The formula used was $\frac{T \times C}{W}$.

It was stated in our report of the M.C.C. Hill-climb last week that W. A. Sale rode a Rex in the multi-cylinder class, whereas he was mounted on a 5 h.p. Vindec Special in Class II. and a 3½ h.p. Rex in Class I. He is second on formula in Class I.

Lancashire M.C.C. Hill-climb on Bunker's Brow. J. L. Macalpine (5½ h.p. twin N.S.U.) travelling "all out" (see next page).

CLUB NEWS.

Mid-Staffordshire A.C.

A members' hill-climbing competition for motor cycles will take place at Sandon Bank, to-day (Wednesday) at 6.30 p.m.

Richmond and District M.C.C.

On the 23rd inst., there will be a week-end run to Petworth, staying the night at the Swan Hotel. On the following day members will proceed to Duncton Hill.

A Motor Cycle Club for Wakefield.

On Thursday last a number of local motor cyclists met at the George Hotel, Kirkgate, and formed a club. Another meeting will be held to-morrow (Thursday) at eight o'clock, and any riders in the district will be welcome.

Crewe and District M.C.

This club held its opening run to Chester on May 2nd, which was a great success. Members are reminded that the 100 miles non-stop trial for the Hutton Cup is to be run on May 23rd, and are requested to send in their entries.

The Liverpool M.C.

The above club's hill-climb will be held on Saturday next at 4.30 p.m. sharp. The hill is about threequarters of a mile long, and the severest gradient about 1 in 7. Entries are invited for the M.C.C. inter-club team trial for *The Motor Cycle* challenge cup.

Walthamstow M.C.

At a committee meeting held at headquarters on Thursday last, it was decided to support the Woodford meet on June 20th. The following new members have recently been elected: Messrs. J. Meads, A. Chapman, F. Lewis, Stott, Kingaby, F. Hayns, O. C. Godfrey, and W. S. Low.

Great Yarmouth and District M.C.C.

The above club's penalty run is to be held to-morrow, the 14th inst. The course is a circular one amounting to seventy-six miles, the starting point being Haddiscoe. The rules are based on those for the M.C.C. team competition for *The Motor Cycle* cup, for which this run will be an eliminating trial. A good entry has been secured.

Sunderland and District M.C.C.

The annual hill climb will take place at Tunstall Hope, on Saturday next, the 16th inst.; commence at 2.30 p.m. There will be three classes, and results will be decided on formulæ. No pedalling will be permitted. Entries should be sent to Mr. S. Wilson, 2, Ash Place, Newcastle Road, Sunderland.

Cardiff M.C.

On Saturday next, the 16th inst., a hill-climbing competition will be held on Rhubina Hill, near Whitchurch, at 3.30 p.m. sharp. The entrance fee is 2s. 6d. for cars and 1s. for motor cycles, and entry forms must be in the secretary's hands by to-morrow morning (Thursday). His address is H. B. Jotham, Grasscroft, Whitchurch, Glamorgan.

Lancashire M.C.C.

The hill-climbing competition for the Harold Eccles Challenge Cup was held on the 7th inst. (see photograph, page 387). The results on time were as follows:

CLASS B.—SINGLE CYLINDERS.

Rider and machine.	Time.
R. Jamieson (3½ h.p. Triumph, 84×86 mm.)	35s.
H. Garstang (3½ h.p. Triumph, 84×86 mm.)	35⅖s.
A. Weldon (3½ h.p. Triumph, 84×86 mm.)	37s.

CLASS C.—TWIN CYLINDERS.

J. S. Turner (6 h.p. N.S.U., 75×90 mm.)	33s.
Hy. Haworth (5 h.p. Vindec, 75×76 mm.)	35⅖s.
J. L. Macalpine (5½ h.p. N.S.U., 75×75 mm.)	39⅖s.

CLASS D.—PASSENGER MOTOR CYCLES.

J. W. Higson (3½ h.p. Triumph with sidecar, 82×86 mm.)	51s.
Hy. Haworth (5 h.p. Vindec with sidecar, 75×76 mm.)	61⅘s.
A. T. Monk (6 h.p. Raleighette, 75×80 mm.)	92s.

Motor Cycle Union of Ireland (Ulster Centre).

The first hill-climbing competition of the season under the auspices of this centre took place at Carnmoney, Co. Antrim, on Saturday last. Class A, confined to private owners, was won by W. Wilson (2¾ h.p. Minerva), in the nett time of 21⅗. The open class was won by A. Bullick (3½ h.p. Jap), in the nett time of 24⅕s. The length of climb was 730 yards.

Dublin and District M.C.C.

The following events are down for decision: May 23rd (Saturday week), members' hill-climb; May 30th, M.C.U.I. speed trials, Portmarnock.

Newcastle and District M.C.C.

A speed-judging competition was held on Saturday last between Ponteland and Belsay, over a course of five miles. The result was a win for R. L. Atkinson (3¾ h.p. N.S.U.), who was, however, 1m. 11s. too fast.

Shamrock M.C.C. (Belfast).

The first hill-climbing contest during 1908 under the auspices of this flourishing club was held at Gilnahirk, County Down, on the 2nd inst., and resulted in a win for M. J. Lindsay (3½ h.p. Triumph) in the nett time of 59⅘s.

Middlesbrough and District M.C.C.

The following are the results of a hill-climb held by the above club on Yearby Bank, near Redcar, on April 21st:

1.	R. W. Day (3 h.p. N.S.U.)	121 marks
2.	W. E. Grange (3½ h.p. Triumph)	108 ,,
3.	H. Rudland (3½ h.p. Kerry)	105 ,,

Leeds M.C.C. Hill-climb.

The above event, postponed from the 25th ult., was held on Saturday last at Beulah Hill; the entries totalled 30, and the A.C.U. formula was used. Competitors were divided into two classes—riders of single and riders of twin-cylinder machines—the winner of each class to compete in the final for the Kirk trophy and a gold medal. The results were: 1, A. B. Hughes (4 h.p. twin N.S.U.); 2, Eric S. Myers (3½ h.p. single Triumph). Other results will be published as soon as they are made known (see photograph, page 385).

The Kelly cup will be competed for next Saturday.

Brighton and District M.C.C.

A petrol consumption trial was held on the 2nd inst. over a five and a half miles course, between Albourne and Henfield, and this had to be covered twice. Competitors' tanks were completely filled at the start and refilled at finish, the amount consumed being carefully calculated. The event was run in two classes, and resulted as follows:

CLASS I.—Twin-cylinder machine, any capacity.

		Petrol.	Miles to gallon.
1.	G. W. Gardner (6 h.p. Matchless-Jap)	25 ozs.	= 83.8
2.	T. Rollon (3½ h.p. F.N., four-cylinder)	24 ozs.	= 73.3
3.	C. E. Sambrook (5½ h.p. N.S.U.)	*33 ozs.	= 70.9
4.	H. Saunders (6 h.p. Bat-Jap)	35 ozs.	= 70.4
5.	R. W. Cartwright (3½-4 h.p. G.B.)	36 ozs.	= 67.7
6.	H. Clifton (5 h.p. Roc)	95 ozs.	= 18.5

*Misdirected; went 3⅝ miles too far.

CLASS II.—Single-cylinder machines, any capacity.

		Petrol.	Miles to gallon.
1.	A. Zapp (2¾ h.p. Rex)	13 ozs.	= 135.3
2.	R. Turpin (3½ h.p. Peugeot)	13½ ozs.	= 130.3
3.	E. L. Waters (3 h.p. Rover)	15½ ozs.	= 113.5
4.	H. J. Gotto (3 h.p. N.S.U.)	16½ ozs.	= 106.6
5.	J. D. Box (3½ h.p. Triumph)	21 ozs.	= 83.3

Messrs. E. G. Waters, Saunders, Cartwright, J. H. Best, and Box acted as officials and petrol checkers, and everything was carried out in an expeditious and satisfactory manner.

Ayr and District M.C.C.

This club held its first hill-climbing competition on the 4th inst. at Whitehill Brae. There were twenty entries. The results, based on the A.C.U. formula, were as follows:

Rider and machine.	F.M.
J. McClure (3½ h.p. Triumph)	55.4
M. Brown (1¾ h.p. F.N.)	58.1
J. Robertson (3½ h.p. Minerva)	58.3
D. Milligan (4 h.p. Werner)	59.9
J. Johnstone (3 h.p. Fafnir)	71.8
G. Cocker (5 h.p. Rex)	76.0
J. Grier (2 h.p. De Dion)	79.7
T. Gray (3 h.p. Quadrant)	80.3
A. Sommerville (4 h.p. Antoine)	95.3
Q. Clark (5 h.p. Rex)	98.8

Four prizes were offered, one for the machine making fastest time, which was also won by Mr. McClure, whose time for the ascent was 41s.

Club News.—

Stockport and District M.C.C.

At the first general meeting of this club at the Mersey Hotel, it was decided that a run should take place every Thursday evening, start 6.30, and the destination should be decided by the members present.

Cambridge University M.C.C.

Saturday next is the date fixed for the hill-climbing competition for the Moring Cup and for the Rolls Cup, and on the 23rd inst. a reliability trial will be held for a cup presented by the Hon. C. S. Rolls. May 30th is the date fixed for the Oxford *v.* Cambridge match.

Western District M.C.

The cup kindly given by the president will be awarded to the winner of a reliability trial to be held on June 14th, the course being to Salisbury and back. There will be a run on May 28th, in conjunction with the Eastern District M.C., to Reigate in the morning, after which the members will accept the kind invitation of Leverton Harris, Esq., M.P., to tea.

Hull and East Riding A.C.C.

The following fixtures have been arranged:

Saturday, May 23rd.—Inter-club meet with Lincs M.C.C.

Saturday, June 6th.—Hill-climbing competition.

Friday, Saturday, and Sunday, June 12th, 13th, and 14th.—Proposed long-distance trial to London and return; start 10 p.m. Friday.

Saturday, June 20th.—Inter-club meet with Lincs M.C.C. at Brigg for Twigmoor Gull Ponds; tea, Angel Hotel, 6 p.m.

Herts County A.C.

We are advised that the A.C.U. Quarterly Trials having been advertised for Saturday, April 25th, and the date changed rather late, had something to do with the lack of entries for the above club's open motor cycle hill-climbing competition. At a meeting of the General Committee held recently, it was decided to call an extraordinary general meeting at an early date for the purpose of submitting to the members and, if thought fit, of passing a resolution to change the rules of the club so as to admit motor cyclists at half a guinea instead of at a guinea as at present.

Cambridgeshire M.C.C.

The following are the fixtures for May and June:

Saturday, May 16th.—Meet at headquarters at 2.45 for the Swan, Linton.

Sunday, May 17th.—Meet at Westminster College at 10 a.m. for the Cross Keys, St. Neot's.

Thursday, May 21st.—Meet at headquarters at 2.30 for Croydon Hill, Cambs. The hill-climb with the University M.C.C. will start at 3.30 sharp. Tea at Hardwicke Arms after competition.

Sunday, May 24th.—Meet at Hills Road Bridge at 2.45 for Newmarket *viâ* Gogs. Tea at the Club, Ely.

Thursday, May 28th.—Meet at headquarters at 2.45 for the Lion, St. Ives.

Sunday, May 31st.—Meet at Victoria Bridge at 10 a.m. for lunch at the White Hart, Wisbech.

Thursday, June 4th.—Meet at headquarters at 2.45 for Ivel, Biggleswade.

Bradford M.C.C.

At the last committee meeting of the above club six new members were elected, and the Secretary stated that the membership was increasing steadily. After much discussion, it was unanimously agreed that there should be formed in connection with the B.M.C.C. an associates' scheme in order that the unattached riders of the North should have the opportunity given to them of joining the Auto Cycle Union at a nominal fee of 5s. The subscription will give to members all the advantages of the club's affiliation to the Auto Cycle Union and R.A.C., but will not carry any right to enter into any of the club events or competitions. The committee feel that this is a step in the right direction, and are desirous that all motor cyclists, who are not already members of affiliated clubs in the North, will become members of the associates' scheme of the Bradford M.C.C., and thereby derive the unmistakable advantages which affiliation to the A.C.U. offers. All interested motor cyclists of the North are heartily invited to apply for an associates' nomination form, enclosing fee 5s., to the hon. sec., Bernard Read, Imperial Hotel, Manchester Road, Bradford.

Motor Cycling Club.

The following new members were recently elected: Messrs. E. A. Anthony, H. A. Bate, H. M. Benkley, F. Biggs, G. Brough, R. O. Clark, H. Collins, B C. Cumberland, V. H. Denchar, A. G. Fenn, H. Fuller, G. W. Mann, R. G. March, H. Myer, W. T. Pershke, F. H. Libley, F. White, and Capt. Sir R. K. Arbuthnot, Bart., R.N.

A Motor Cycle Club for Halifax.

At a meeting held on the 28th ult., at the Old Cock Hotel, it was decided to form a motor cycle club for Halifax and district. As there are a large number of riders in Halifax and neighbourhood, a strong club ought to be formed. The next meeting will be held at the above hotel to-morrow (Thursday), at 8 p.m., when any private owners of motor cycles wishing to join will be cordially welcomed.

Essex M.C.

The open hill-climb at Lippett's Hill, High Beech, which will be held next Saturday, should be a most successful affair. There will be no handicap and no formula, but a number of classes have been instituted so as to place the machines as nearly as possible on the same level. The idea is a good one, and owes its origin to that enthusiastic and energetic member of the club, Mr. A. G. Reynolds. Each machine and rider in each class must together scale a certain amount, so that if the rider is a lightweight he must carry sufficient ballast on his machine to make up for the deficiency, which will tend to place everyone on the same basis.

The classes are: *(a)* Single-cylinder motor bicycles. Class 1, cylinders not exceeding 82 mm. bore; Class 2, cylinders not exceeding 85 mm. bore; and Class 3, cylinders not exceeding 90 mm. bore. Machine and rider in each class to weigh not less than a total of 320 lbs.

(b.) Twin-cylinder motor bicycles. Class 1, each cylinder not exceeding 76 mm. bore. Class 2, each cylinder not exceeding 80 mm. bore. Class 3, each cylinder not exceeding 85 mm. bore. Machine and rider in each class to weigh not less than a total of 340 lbs.

(c.) Lightweight motor bicycles. Class 1, standard lightweight with engine not exceeding 2½ h.p.; machine and rider not to weigh less than 250 lbs.

(d.) Passenger motor cycles (sidecars and forecars). Handicap, time allowance. No. h.p. or weight limit.

(e.) Passenger motor cycles (tricars, quadcars, fitted with variable gear). Handicap, time allowance.

Slow test. All machines eligible in *(a)* *(b)*, Classes 1, 2, and 3.

York County M.C.C.

The above club held its first competition—a consumption trial—on the 2nd inst., over a course of exactly twenty-five miles, from Wetherby to Boroughbridge and back. The results were worked out on the following formula: Weight of rider in lbs. + cubical capacity in centimetres ÷ the amount of petrol consumed in ounces. It is interesting to note that three twin-cylinder machines were competing, and on the formula occupied first, seventh, and fourteenth positions—a fact which should prove that the formula adopted did not give the twin-cylinder machines any advantage. On formula, the order of merit is:

Name.	Make of machine.	Fuel consumed. Ounces.	Figure of merit.	Miles per gallon.
C. Potter	(7-9 h.p. Bat twin)	50	23.3	80
H. Noble	(3½ h.p. Triumph)	29	21.24	137
J. Chadwick, jun.	(3½ h.p. Triumph)	29	20.96	137
C. S. Allan	(3½ h.p. Triumph)	30.1	20.19	132
H. H. Charge	(3½ h.p. Triumph)	33	19.24	121
C. H. Benn	(3 h.p. Triumph)	27.75	18.63	146
E. H. Noney	(4½ h.p. Minerva twin)	40	18.55	100
R. Durham	(3½ h.p. Triumph)	31.75	18.45	125
E. Slater, jun.	(3½ h.p. Triumph)	34.6	18.43	115
H. Wilkinson	(3½ h.p. Triumph)	36	17.35	111
C. Wilson	(3½ h.p. Triumph)	36.5	17.16	109
R. Wilkinson	(3 h.p. Triumph)	31.25	16.66	128
W. F. Savory	(3½ h.p. Triumph)	39	16.51	102
H. R. Croisdale	(4 h.p. N.S.U. twin)	56	11.96	71
C. Graham	(3 h.p. Triumph)	Non-starter.		

LETTERS TO THE EDITOR.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Low Petrol Consumption.

[3300.]—In reply to "Subscriber's" letter, the machine which ran thirty miles on a pint of petrol is fitted with a 2¼ h.p. engine, but I cannot say exact cylinder dimensions. Gear 6 to 1. Rider's weight 9 stones. E 123.

Unattached Riders.

[3301.]—I am glad to see you are considering the unattached rider. There are A.C.U. "advantages" numbered 1 to 15. All I have any use for is No. 2 and No. 12, and, as I take *The Motor Cycle*, I can well do without No. 12.

No. 2 (Possible legal assistance).—If my case is a very unusual one, and one likely to bring credit upon the A.C.U. if they take it up, I think 5s. per annum quite enough for that. It is not an insurance. REUBEN G. NORMAN.

[3302.]—i ope yu will forgive me for ritin to yu, but i am a demon for wantin to no things, and wen i sees this in ure paper—"The very existence of the A.C.U. depends upon Funds"—i goes to our captan and says, ure smart, can you tell us wat it means, an he says, yu've got to reed atween the lines, so i gets a big glas an lucks carefully, an i can't see nothin, so i says to meself, the Editor of our paper is the man to put me rite, an wat i wants to no is, supposin our club ad fillyated in january we shud all of us ave ad the club paper sent to us every weak, wich wood av cost the A.C.U. 2s. 2d. for postage. Our filly ashun fee is only 2s. ahead, ow do they get the funds that they want. i ope u wont laff to much at me for ritin to yu, but i think the A.C.U. mite send us the 2d. per member insted of the paper, and fillyate us for nothin. The A.C.U. wud av a full membership and our club wud av mor money. EF 5.

[3303.]—Your article in *The Motor Cycle* of April 29th admirably voices the views of unattached motor cyclists. This class of cyclist rides simply for his pleasure, and is not likely to be coerced into joining a provincial club merely to secure the "advantages of affiliation with the A.C.U."

Really, this cock-a-hoop attitude assumed by the A.C.U. in the matter of the unattached motor cyclist strikes me, for one, as being a trifle ridiculous, especially when I remember that the A.C.U. is not in the position to offer anything like the substantial advantages secured by the modest subscription of 5s. to the C.T.C. This old and powerful organisation is, moreover, indispensable to all cyclists who tour on the Continent. No, leave the A.C.U. and its local satellites to cultivate the "sport" of hill-climbing; for the rest, the C.T.C. should serve well enough.

HARRY A. BULLOCK.

[3304.]—In your issue of April 29th the editorial dealing with the unattached rider conveys to me the impression that hitherto the Cyclists' Touring Club has not catered for the motor cyclist. Please allow me to correct this impression.

Will you also kindly permit me, through your correspondence columns, to correct another impression which seems to be widespread, *i.e.*, that the C.T.C. does not welcome motor cyclists. This impression is quite wrong. The C.T.C. does welcome the motor cyclist, and to the non-racing man offers more advantages than any other club. A nominal entrance fee (1s.) and subscription (5s.) includes a monthly gazette, a very complete hotel guide, comprising hotels to suit all purses, and legal assistance when necessary.

The motor cycle committee is at all times ready to consider any suggestions for the furtherance of motor cycling interests by the club, and should a sufficient number of motor cyclists evince a desire for such a step, no doubt a motor cycle section could be formed within the club on the lines of our distri associations, affording motor cycling members opportuniti for meetings, discussions, tours, etc., etc.

In the C.T.C. the motor cyclist and the push cyclist sha alike the advantages of a vast organisation, which has sto the test of time, and hope by hearty co-operation to strengthe the position of both upon the road.

B. P. S. ROOKE,
Chairman Motor Cycle Committee C.T.C.

Gudgeon Pin Accidents.

[3305.]—The accompanying drawings will, I think, h to explain why makers apparently "waste iron" at t bottom of the cylinders (see letter 3263). It will be seen th the angles formed by the pist rod in fig. 2 are far smal than those in fig. 1, and con quently an engine designed the principles of fig. 2 w be more efficient, since diminishes the angle at whi the piston rod works. Anotl expedient to reduce this an was employed by Richard Cie. and in the Ailsa Cr engine, viz., the offset cra shaft.

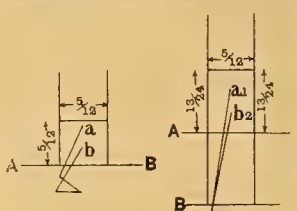


FIG. 1. FIG. 2.
A. Bottom of stroke.
B. Bottom of cylinder.
Piston rod, ½in. Piston rod, 1 in 5/8. Cylinder 5/12 · 5/12in. Cylinder 5/12 · 1 3/4in.

A glance at any of t Atlantic or big six-coup loco's on any railway will b out the principle; for a 30in. stroke a connecting rod of 14 is sometimes employed.

If lengthening the cylinder is merely waste of iron, why firms like the Triumph, Minerva, and J.A.P. (especially t 3½ 85 by 76 of the last-named firm) employ engines this design?

Anent the gudgeon pin story, I rather agree with M Hayton that there was a slight misstatement in it as origina told. I see "Ixion" is very cautious in his latest yarn. I I trust that criticism will not cause him to refrain from telli any more that may come his way.

JOHN F. H. TEMPLER

Lightweight Experiences.

[3306.]—Having noticed many articles in your valua paper on lightweight machines, it may not be out of place relate my experience on one of these machines.

I purchased at the last Stanley Show a Douglas 2¾ h lightweight twin opposed engine, with outside flywheel a Bosch magneto.

This little machine has not given me the slightest troub and I have had many pleasant trips, as I have ridden it so 1,700 miles.

Some riders I notice are troubled with head wind on ligh weights, but this has never troubled me the slightest, and t machine will do the Redhill on the London-Exeter road wi the greatest ease.

It was only last week that a friend and myself rode Birdlip Hill to test our machines, and to our surprise t little machine, with a gear of 5½ to 1, went up Birdlip wit out any assistance whatever.

This I consider a good performance, and the machine very fast on the level—thirty miles per hour can be obtaine

I feel sure this machine will knock out a lot of the heav weights for comfort, speed, and reliability.

J. KIDDELL.

The M.C.C. Members' Hill-climb.

3307.]—In your issue of May 6th (page 362), referring to
M.C.C. members' hill-climb at Sharpenhoe Hill, you com-
e the time of the cars and bicycles up the hill. This is
quite fair, as the motor bicycles had a moving start,
ereas the cars started from a standing start. I merely
ntion this for the sake of accuracy, as no one has a higher
nion than I have of a motor bicycle and its wonderful
vantages and capabilities. At the same time the motor car
its uses, and no good purpose is served by making com-
isons which are not correct. S. F. EDGE.

Below is the paragraph referred to on page 362:

"After the course was clear again, the car class was run off, Mr. S. F. Edge (40 h.p. Napier) making the fastest time, namely, 1m. $2\frac{4}{5}$s. We mention this fact to show where the 40 h.p. six-cylinder would have been had it competed with the motor cycles. It would have been beaten by twelve of the twin-cylinder machines and four of the single-cylinder motor bicycles. Motor cyclists, therefore, still hold the field as far as hill-climbing is concerned."

e should be the last to wish to publish anything disad-
vantageous to such an old and experienced ex-motor cyclist
s Mr. Edge, and although we do not admit that the
aragraph is incorrect, we inadvertently omitted to state
hat the bicycles were given a flying start. As far as the
astest times are concerned, there were $13\frac{3}{5}$ seconds differ-
nce between the fastest car and the fastest bicycle. Making
ull allowance for the flying start, the bicycle was clearly
he faster.—ED.]

Belt v. Chain and Two Speed Gears.

3308.]—The interesting controversy which is at present
ceeding on this subject in your journal between Messrs.
H. Davies, A. Wharton Metcalfe, and others is rather
using to an old stager like myself.

Four years ago last August I was preaching the doctrine of
speeds for motor bicycles to Mr. Harry Smith, of the
ver Co., Ltd., in his office. This, I think, was before
Davies had ever acknowledged the necessity of any
uction of gear on hills, and while Mr. Fawcett was
ting scornful letters on the effeminacy of multiple gears
your valuable paper.

The question of two speeds has, I am afraid, nothing to do
h belt or chain transmission as such. The question is
iency as compared with increased weight and friction.
Davies says that "the belt has altogether ousted the
in"; and why? Merely because belt drive is more
able for lightly built machines and imperfectly skilled
ers, on the one hand, and, on the other, it is more cheaply
ed by the manufacturer. Mr. Wharton Metcalfe plumps
the chain. He says "its efficiency as a transmitter and
reliability place the chain far ahead of the belt for touring
winter riding."

have for the past two winters driven a two-speeded
yclic-geared car with single chain transmission, because I
not get an efficient two-speeded bicycle for my work.
the distance driven (9,000 miles) I have worn out five
ins, and I have had six accidents through chains. The
happened two weeks ago, when the chain jumped the
sprocket, jammed, and twisted the main axle half a
olution. This would have caused a somewhat serious
dent on a bicycle. On the other hand, I drove for the
winters preceding a 3 h.p. single-geared belt-driven motor
cle a distance of 10,000 miles. I used in this time and
ance two Continental rubber belts and an adjustable
ey. I never had any trouble except that after soaking
mud for a day or two the belt-fasteners occasionally
ed through.

till, from these personal experiences, I do not say that
belt is superior to the chain.

What we professional users of motor cycles want is for the
ufacturer to listen to us, and not to the so-called
tsmen and trade riders. These persons are fair weather
, whose hearts would be broken if they got a night
in January with a drizzle of sleet falling, or an urgent
sage about 2 a.m. in October with a thick white fog
ut, to ride five miles, partly up one in eight, and round
d corners, on a surface of new butter and cart ruts.
know what we want, and some day the trade will give
s, in spite of Mr. T. Barter (letter 3221, *The Motor Cycle*, April 1st—appropriate date). "Variable gears," he says, "are not needed, as they add to complication." How often was this written three or four years ago, and yet a number of so-called variable gears have been coming into the market week by week ever since. This gentleman is a designer. I should like to modify his designs and also his views by a course of practical night riding over country byroads.

I am a medical practitioner, not an engineer; a user, and not a builder. I know what I want, and do not need to be told. I want a machine reasonably light, but not unnecessarily so, with pedals, a fairly high direct drive on top, and a low emergency gear which must be efficient. The machine must be as good on top as any single-geared machine of the same horse-power and weight. There are thousands of men in this country who want this, and we look to the motor engineers of England to produce it.

The two or more speeded gears at present on the market have all their disadvantages. The majority are very heavy, to such an extent that for the same h.p. they are only two-thirds as efficient as their single-speeded brothers. A number are fitted on the engine-shaft—a bad place for gearing—and, further, require an adjustable pulley to be varied according

H. G. Partridge on a twin N.S.U. riding through the floods on the road to Aylesbury in the last Quarterly Trials. This rider made a non-stop run and has been awarded a certificate.

to the weather and condition of the roads. Of those in the back hub, the Phœnix has that drawback (to my mind), a dog clutch, and another (the Roc) does not allow of the use of pedals—an absolute necessity, in case of breakdown, for a medical man.

These back hub gears one hears on all sides have a habit of not engaging when required and of engaging when not required, and of disengaging when not expected. Perhaps some users could tell your interested readers, self included, if this is so or not. There are two of us in this neighbourhood who have had a go at every form of speed gear that has come anywhere within reach, and have been for three years, and still are, riding single-geared 1904 3 h.p. machines with adjustable pulleys, footrests, and non-skid tyres. When any maker brings out a useful 3-$3\frac{1}{2}$ h.p. single-cylinder with pulley on engine-shaft, with two speeds in hub, two ignitions (in case of breakdown, and for easy starting), weight about 170 lbs., preferably with pedals, in fact what I have been asking for for nearly four years, then we will give our old crocks a long rest. Further, we shall be able to preach the benefits of motor cycling without feeling that one is looked upon by one's friends as a tout for unpractical machine makers.

CHARLES S. PATTERSON, M.B., M.R.C.S.

Courtesy at the Shows.

[3309.]—I have followed with interest the correspondence in your columns headed "Courtesy at the Shows."

It is astonishing what apathy and arrogance the average Britisher will bear without public complaint, otherwise this question would surely have been raised before. I, with a number of others, have long since come to the conclusion that the smartly-tailored, silk-hatted gentlemen, with the big cigars, who are posted at the various stands, should be supplanted by practical, even if less ornamental, individuals, who could, and would, give the information wanted by enquirers.

A common instance of deplorable lack of courtesy occurred at the last motor car show in Liverpool, when I, a prospective buyer asking for information about a car in which I was interested, was haughtily referred by the "Chief" of the English agency for the car in question to one of his salesmen, whom I found just as arrogant as his employer. I left the stand in disgust, and the purchase was made elsewhere.

This mantle of apathy appears to have also descended upon the cycle trade, else I am unfortunate in my experiences, inasmuch as an order I sent on March 7th—for a "stock" article—to one of the largest and best known manufacturers of lamps in this country was forgotten (?). A reminder sent three weeks after failed to elicit a reply, and, being in actual need of the goods ordered, I, after a further lapse of time, made another application, this time addressed to "the manager." This communication was acknowledged five days after its receipt, and I was informed without comment that my order would be despatched next Thursday—that was two weeks ago—but the goods have not yet arrived.

I have always been of the opinion that courtesy and promptness were the elementary principles of business, but these qualities seem sadly lacking in a large proportion of the individuals and firms engaged in the cycle, motor cycle, and motor car industries of this country.

R. S. BROOKE-HITCHING.

Fixed v. Flexible Pattern Sidecars.

[3310.]—The appearance of Mr. Douglas Leechman's letter under the above heading in your issue of April 29th pleased me very much.

I am only a plain mechanic myself, whereas Mr. Leechman, although not a mechanic or a professor of mechanics, is a barrister trained in argument and legal controversy, and learned in the law, and, furthermore, is strongly interested financially in the sales of rigidly attached sidecars. Therefore, it is fortunate for me that the question of the sidecar cannot be disposed of by argument. As the maker of the sidecar on the good qualities of which Mr. Leechman addresses his remarks.

In the first place, Mr. Leechman is incorrect in comparing his rigid sidecar to a tricycle, because a tricycle is driven from the centre and steered from the centre, whereas the sidecar is driven and steered from one extreme side.

We all know how difficult it is for a bicyclist to steer a tricycle at the first attempt, but this is the fault of the rider and not the machine. With a rigidly attached sidecar the fault is fundamental with the machine, and no matter how practised the rider may become, the wrong principle cannot be removed, and is especially noticeable on high cambered roads, or when attempting to drive the combination with sidecar empty.

The other points Mr. Leechman refers to could also be disposed of very easily, because every claim made in favour of the particular sidecar he discusses has been established by actual test, and can be proved again whenever required.

As a reader of *The Motor Cycle*, Mr. Leechman must be aware of my anxiety to prove in competition with the rigid sidecar that all the exclusive claims made for the flexible sidecar can be substantiated in fact.

Bury St. Edmunds is an old town with some narrow streets, numerous sharp corners, and twisted road surface. It is on this ground the flexible sidecar has been perfected, and I can safely say that no rigidly attached sidecar, however expertly handled, could be driven over the same ground; many have tried, but none succeeded.

Seeing this is such a busy time of the year, I would suggest to Mr. Leechman that, instead of writing more letters, we arrange a meeting forthwith. In the meantime I would remind him that my advertised offer to pay £50 to the rider of any rigidly attached sidecar whose bicycle wheels are not out of alignment still holds good. W. MONTGOMERY.

Set Screw Experiences.

[3311.]—Talking of set-screw experiences, rather peculiar piece of luck came my way a few weeks ago. I ha no trouble with the engine of a second-hand machine I go some three months previously, using it daily, till one morn ing on attempting to start up I found the engine jamme hard and fast. A friend and I took it down and discovere a set-screw lodged between piston rod and baffle plate. Th was lucky enough, as it might have elected to jam when was travelling at twenty miles per hour, but it was nothin to what followed. We made sure that the remaining se screw was snugly *in situ*, and my friend was casually tur ing the starting handle round when, lo and behold! anothe set-screw appeared at the small opening between the baffl plates, carried up by a veritable (fly)wheel of fortune, t which, thanks to the thick cold oil in the crankcase, it ha

F. W. Applebee (twin Rex) riding through the water splash in the A.C.U. Quarterly Trials. He has been awarded a non-stop certificate. (*Photo by J. Van Hoqydonk.*)

providentially adhered. Criminally abandoned by a forn owner or a "repairer," it had remained harmless, but constant source of potential disaster during months of r ning. The space between flywheels and crankcase was ceptionally small, and when it appeared slowly before astonished eyes there was hardly a hair's breadth between returning wanderer and the aluminium. Three weeks la the engine again jammed on starting up, and we fu expected to find a few more set-screws knocking around, the two on duty were still in position. We therefore h to separate the two halves of the crankcase—a long job in case of this tricar—and on exploring we found a piece stout steel wire bent and battered, 3in. long, a smaller pi of ditto, and a chunk of baffle plate, evidently knocked by set-screw No. 2.

H. S. GASKELL.

SUMMARY OF CORRESPONDENCE.

Will "Engineer," Saltley, kindly note that no notice can taken of letters that do not bear the full name of sender well as address?

Zenith Motors, Ltd., write: "In the report of the A.C. Quarterly Trials we notice that Mr. F. W. Barnes's time Gore Hill is given as 1m. 19⅕s. behind the first machi We would like to point out that Mr. Barnes had to stop the middle of the hill owing to being blocked by a lan and pair of horses, and, without stopping his engine, started, and finished the hill in this time."

EXPERIENCES WANTED.

"P. B.," Stafford, would like readers' experiences of 4½ h.p. F.N., particularly with regard to economy in pe and oil, vibration, upkeep, and starting.

"T. P.," Pontypridd, would be glad of readers' experien of a sidecar attached to a 3½ h.p. 1908 Triumph, fo moderately hilly district.

EPR

Accumulators

should be specified when ordering your new 1908 mount.

They contain all the latest improvements in storage battery construction. Our new list will tell you why "E.P.R." cells are now so generally used. It will also save your money. A post card will bring you a copy by next post.

¶ What about your present accumulator? Why discard it and throw away money? Better send it up to us, and we will make it as good as new for about half of the cost of a new cell. We could send you letters received from clients all over the country, expressing absolute confidence and great satisfaction with the way we have dealt with their repairs.

¶ AGAIN. What about your present accumulator? Not worth repairing? Well, again we say, don't discard it. We take old cells in part payment for new "E.P.R." guaranteed accumulators. ONLY, please note this, our prices are fixed as low as can be consistent with good material and first-class workmanship. WE DO NOT CHARGE YOU A HIGH price for a new accumulator, and then allow you an inflated price for your old cell. Our prices are low, and the allowances we make for old cells are actual market value.

¶ We have specialised in accumulators since 1902, so you get the benefit of our experience.

P.S. DON'T forget to post that card to-night.

Richford and Co.

(Dept. M4),

ACCUMULATOR SPECIALISTS,

Ordering Spares by Wire.

A TRADE correspondent calls our attention to the much abused system of ordering spare parts by telegraph or letter. Some motor cyclists, it is pointed out, are in the habit of telegraphing or writing urgently for parts of motor cycles, and in cases of extreme urgency they will often wire on a Friday afternoon asking for certain parts to be despatched the same night. The writer says that his firm has endeavoured to accommodate clients by despatching the parts as requested, but in so doing finds that in many instances the motor cyclist is either careless or unscrupulous enough to think that a small debt is not worth troubling about, and in consequence the firm has between £200 and £300 in small items on its books which it is practically impossible to collect, and the cost of sending out invoices and letters asking for remittances has far exceeded any profit which might have been made on the parts originally. The result is that the directors of the firm we instance now insist that no goods shall be sent out until they are paid for, which, of course, will mean at least two days' delay, unless the customer is wise enough to send with the telegram ordering the parts a telegraphic remittance, which only costs threepence extra for small amounts. It must be remembered that motor cycles change hands frequently, and firms often receive communications ordering a part to be sent on by return from people of whom they know nothing, and, as we have pointed out above, in trying to accommodate customers one firm finds itself saddled with rather a large bad debt made up of small items. This is another instance of a few unscrupulous or careless persons causing inconvenience to the majority, much in the same way as careless or reckless drivers cause a great deal of inconvenience to others who are more considerate.

The very best plan to adopt in cases where spare parts are likely to be required in a hurry is to start a small deposit account with the makers, say £3; then if a small part or accessory is wanted in a hurry on tour, the rider sends off a wire, and the part will reach him next morning, and its cost deducted from the deposit in hand.

Seasonable Warning.

WE were witnesses last week of a rather serious accident to a motor cyclist, which once again shows the necessity for caution at cross roads, particularly those bifurcations where high walls or hedges are carried within a few feet of the corners. The accident referred to was, we think, one of those unfortunate collisions where real blame could not be attached to either parties concerned—a motor cyclist and an autocarist—but if there was any fault we fancy the motor cyclist was travelling too fast, taking into consideration the fact that he was approaching cross roads. New riders are constantly joining the ranks of motor cyclists, and many of them are not accustomed to the high speed of a powerful motor bicycle. The fastest machine is perfectly safe in the hands of a good and experienced rider, but novices should, above all, be extremely careful. With a straight road devoid of crossings and with no traffic in sight no objections can reasonably be raised against moderately high speeds, but on twisting roads, at crossings, and where other traffic may reasonably be *expected*, the rider should always have his machine so far under control that he can, if necessary, stop within a few yards with the aid of the brakes.

Erroneous Impressions Removed.

By DIOMED.

AT this time of the year the motor cyclist is busy tuning up his mount or fitting new accessories in preparation for finer weather. Similarly his push cycle brother takes his lifeless machine from its vaseline bath and prepares it for another series of pedal revolutions. Perhaps on his first ride the push cyclist is overtaken by a motor cyclist, who, with coat tails flying behind him, makes speedy work of the long gradient up which the poor pedaller is struggling.

Within his heart the toiler murmurs, "Lucky beggar! I wish I could get up this hill as easily as he does, but I wouldn't own one of those monsters for anything!" He doesn't go any deeper into the matter; he seems to prefer to keep one view.

Now, Mr. Push Cyclist, I would have a word with you. Did you ever seriously consider taking up motor cycling as a substitute for the old fashioned method? No. Why not, pray? What! couldn't afford to buy a motor bicycle, too difficult to manage, too noisy, too bumpy, too many accidents, too many breakdowns, too expensive to keep up, bad for the health! My dear friend, that's all humbug you're talking. Is it reasonable to suppose that 60,000 motor cyclists would endure the above allegations if they were true? I see you share the opinion of the man in the street, but, for your benefit, and for the benefit of those others in the same boat, I shall endeavour to show how entirely erroneous are the ideas, and at the same time point out the advantages motor cycling has over pedal cycling.

To deal first of all with the idea that a motor cycle is an expensive piece of machinery: It is true that a good motor bicycle, suitable for a learner, can be purchased second-hand for about £15—no more than the price of a high class pedal mount a few years ago. Some people dismiss from their mind the idea of purchasing a motor cycle, because they are of opinion that the first outlay will amount to £40 or £50. The writer commenced motor cycling on a £15 machine, and thoroughly enjoyed riding it.

Learning Quite Simple.

With regard to learning—well, there is simply no learning required. Anyone who has ridden an ordinary bicycle can ride a motor bicycle in two minutes. After a preliminary acquaintance with the various levers on the stand in the backyard, a run on the road can be undertaken, and after half-an-hour the new convert will feel more at home than ever he did on his old push bicycle.

That the average motor bicycle is noisy cannot be denied; but some makes have very efficient silencers, so it is really a question of choice. It may be mentioned that the noise of the exhaust is more audible to onlookers than to the rider of the machine.

The popular fallacy that the motor bicycle is a bumpy conveyance is no doubt due to the rapid explosions giving the semblance of a series of bumps or vibrations. In reality the explosions of the engine in no way affect the rider, and with spring forks, large tyres, and large saddle, travelling, even at very high speeds, is pleasurable—almost luxurious—on a good road. It is not going too far to state that the motor cycle is far more comfortable than its push brother.

It is absurd to suppose that a motor cycle is the frequent cause of accidents. Reference to statistics will prove that accidents *caused by* motor cycles are of very rare occurrence indeed, and infinitesimal when compared with those caused by other vehicles. A motor cycle is more amenable to control than any other road vehicle. Raising one lever and gently applying the brakes will bring a machine travelling at legal speed to a standstill in an incredibly short distance, so that the risk of an accident in that direction is considerably minimised. Of course, a stupid hen (and hens *are* stupid), a dog, or a nervous horse may cause hasty dismount, but in ninety-nine cases out of one hundred it will be found that the accident was not caused by the motor cycle, but the other party in the case, and accidents of this nature are just as liable to occur to the pedal cyclist as to the motor cyclist.

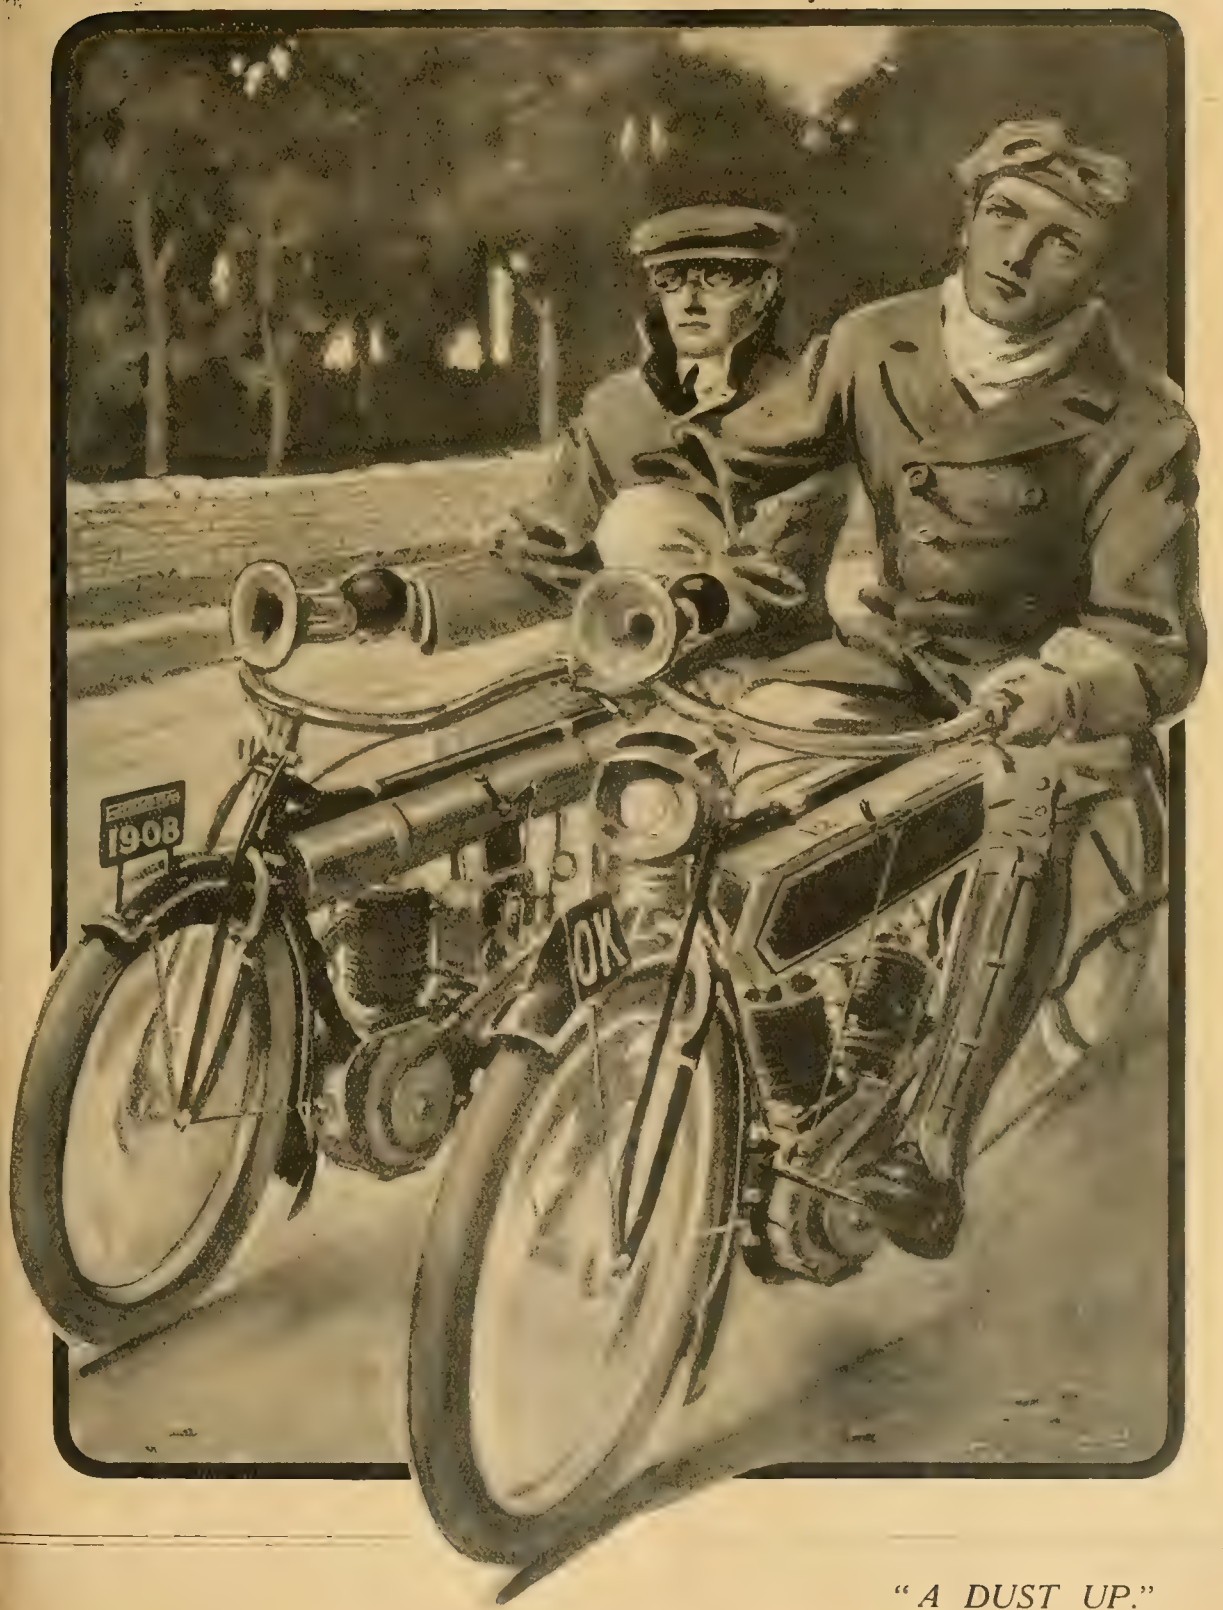
Motor Cycles Now Admittedly Reliable.

The once prevalent idea that a motor cycle is unreliable is, fortunately, dying out. It was true of all motor-propelled vehicles years ago, but experience teaches, and the motor cycle of to-day is as perfect a piece of engineering as the world may hope to see for some time. A rider may occasionally be seen dismounted with his machine on the stand, but it will generally be found to be due to some trifle which is put right in a couple of minutes. The reliability of the motor cycle is becoming phenomenal, as the numerous long distance trials throughout the country will testify.

With regard to running expenses, practically every user of present day machines agrees that a motor cycle is wonderfully economical in running cost. One hundred miles for 1s. 9d. or 2s. is regularly covered by riders of moderate powered machines.

Regarding the health point of view, there are hundreds of doctors who use motor cycles regularly which speaks for itself. Many have given it as their opinion that, far from having any deleterious effect, motor cycling improves the system. The rapid exhilarating motion refreshes and invigorates the whole body. The prevailing delusions having now been disposed of, it only remains to state some of the advantages which motor cycling possesses over all other forms of locomotion. To those living in towns it is an inestimable boon, as it enables them to reach the open country and the pure fresh air in a minimum of time with a maximum of ease. It enables all of us to go long distances, to penetrate into all corners of our tight little island. It enables us to see a large amount of beautiful Britain which we would otherwise be unable to see. Rudyard Kipling has said, "*That* is the real joy of motoring, the exploration of this amazing England. It is a land full of stupefying marvels and mysteries."

We are advised that the price of the Osborne four speed pulley has been considerably reduced. The makers, Osborne Bros., are also introducing a new three-speed pulley and free engine, which will be known as the Popular. Further particulars can be obtained from Princess Works, Lincoln.



"A DUST UP."

HINTS AND TIPS FOR MOTOR CYCLISTS.

By Road Rider.

(*Continued from page 338.*)

OPENING PETROL CANS.

209. The rim on the bottom of another can is always available and certain, though it is not good for the can.

PLIERS.

210. A good tool kit contains three pairs of pliers—medium-sized gas, small flat-nosed, and Taylor's patent nutgrips.

POCKET TOOLS.

211. It is a sore temptation always to carry a small paraffin can, adjustable spanner, and screwdriver in the pockets. In this way many good coats are ruined by budding motor cyclists. Many excellent little pocket cases containing these and other handy essentials of first quality, and in leather cases, are on the market.

RE-STARTING A MOTOR BICYCLE UP HILL.

212. A weakly rider with a single-geared machine and no clutch should return to the bottom and make a fresh start, or else find a side road descending to enter the hill at an angle. A strong rider should make the most careful preparations, flooding carburetter, injecting a little petrol into the cylinders, and then give a good push. One strong, masterful heave is worth yards of weak, half-hearted pushing. Do not mount the instant the engine fires, if the grade is steep, but allow it a yard or so to pick up speed.

RIDING POSITION.

213. The most comfortable and safest riding position is afforded by setting the saddle low down amidships, fitting footrests in a natural position to match, and bending over the ends of the handle-bars at an angle, so that if produced they would strike the ground a few feet to the rear of the machine. The so-called "racing" position renders one less master of the machine on grease, looks ungraceful, and removes necessary weight from the front wheel.

SIDECARS.

214. The rigid sidecar is the cheapest pattern. Its disadvantages are that it is not very comfortable to drive at any speed over twenty-five miles an hour, it is not readily detached, and much care is required in turning corners with it until expert. Its advantages are that it is perfectly immune from sideslip.

The Montgomery sidecar can be attached or detached at any moment in a couple of minutes, and is very pleasant to drive at all speeds. The Castor wheel sidecar is also very comfortable to drive. The rigid sidecar alone of these is entirely immune from sideslip, but the other two are perfectly steady if an armoured tread is used on the bicycle's rear tyre.

It is folly to fit a sidecar to a bicycle that is poorly braked. If the sidecar wheel be braked, the steering will be interfered with. The sidecar is preferably fitted to the left hand side of the machine, as ladies dislike being too close to approaching traffic. Fitting it on the right hand has, however, one great advantage—it is easier to mount the bicycle from the left side than the right.

A side lamp is essential, and a tail lamp advisable.

SIDE-SLIP.

215. A sensible confident driver will sideslip no more on two wheels than on four.

A quadcar slips exactly like a car, and if a driver is troubled by it, he should use armoured tyres on the rear wheels.

A tricar with a smooth rear tyre does not sideslip, but waggles gently and will sometimes fail to answer the helm round a sharp corner when the road is greasy. A tricar with an armoured rear tyre is as steady as a rock.

A rigid sidecar does not sideslip.

A flexible or castor sidecar can skid badly, but will not skid at all if provided with an armoured tread on the rear tyre of the bicycle.

A trailer is dangerous on greasy roads.

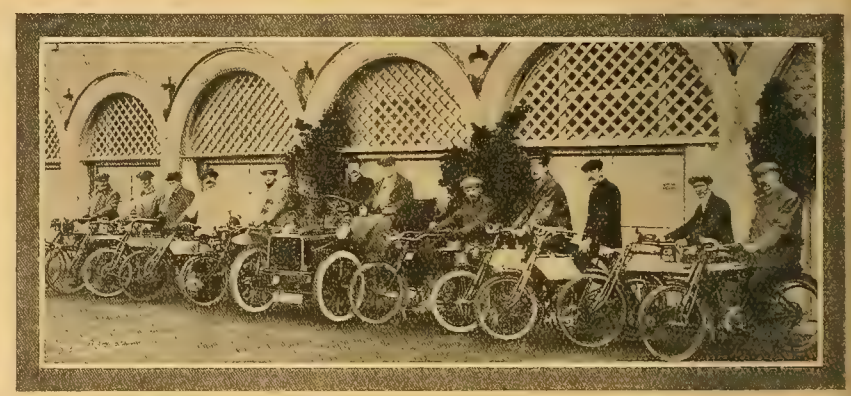
The silencer must be kept clear from burnt oil, otherwise heavy back pressure will be put upon the engine.

SPRINGS FOR PASSENGER MACHINES.

217. It is a great mistake to order a fore or sidecar without specifying the weight of the usual passenger. The makers know what strength of spring is best suited to particular loads.

TESTING PLATINUM.

218. Platinum being a precious metal, price considerations have caused people to market contact fitments equipped with rivets of other metals, which soon burn and pit, and lead to misfiring and loss of power. Any jeweller will test a suspected contact, or it may be tested at home by placing a small filing of the suspected metal in a test tube with a few drops of nitric acid, and heating it over a Bunsen burner, when true platinum will be found to stand the heat, but imitations will dissolve and dye the acid green.



Some members of the motor section of the Brighton Cyclists' Club assembled for the run to Billingshurst. The hon. sec., Mr. F. C. Wiffen, is fourth from the left.

A motor bicycle depends for safety rather on the pluck and personality of the driver than on the nature of the machine and roads. Anyone can hold up the modern belt driver if he makes up his mind to it. Difficult machines to handle over grease are those with chain drive, high frames, and high gears. A non-skid band fitted with either rubber or steel studs on the rear tyre is less liable to skid.

SILENCERS.

216. It is a great mistake to have too good a silencer. A motor bicycle catches the eye far less than a car, and a silent motor bicycle is likely to be concerned in accidents. If a really good silencer is fitted, the horn will have to be used *ad nauseam*.

A cut-out should be fitted for the sake of climbing exceptional hills, but should never be opened in the neighbourhood of traffic or houses. If a very quiet silencer is wanted for passenger work, the Sharp silencers secured highest marks (over eighty per cent.) in the only trial ever held for motor cycle silencers.

TOOLS AND HOW TO CARRY THEM.

219. The best outfit for all motorists is a roll-up looped strip, with pockets for oddments in the end. The touring kit should include:

One 8in. wrench.
One small adjustable spanner.
Special open-ended wrenches for all inaccessible nuts.
Trembler coil or magneto spanner, if either is used.
Small pair of flat-nosed pliers.
Short, strong screwdriver.
Valve spring remover.
Half-round file with cover.
Contact file and case.
Tyre repair kit. Inflator. Oilcan.
Paraffin or petrol can.
Copper wire, thick and thin.
Sparking plug, valve cap, and compression tap washers.
Two spare valves complete.
Three spare plugs complete.
Belt punch or drill.
Two spare belt fasteners.
Fine wire for clearing carburetter jet.
Sundry nuts and bolts.
One or two spare nipples for Bowden wires if used.

TOURING MACHINES: THE WEIGHT QUESTION.

THERE has appeared recently in the columns of *The Motor Cycle* a good deal of discussion as to the various merits of the lightweight motor bicycle which may possibly lead some to think hat the day of heavy twins and singles, except from purely sporting point of view, is beginning to decline. Advocates of lightweight motor bicycles contend, nd rightly too, that a low powered, light machine is andier, cheaper to run, will travel quite fast enough or most riders' requirements, and will climb most hills ith light pedal assistance, and they ask, "What more o you want?"

Weight and Comfort.

Leaving out the question of speed, my answer to this, nd I think most old motor cyclists will agree, is that he lightweight as a touring motor cycle lacks the omfort of the heavier machine. After a good trial n one of the latest lightweights (a miniature twin-ylinder) I am bound to confess that ease of control nd smooth running of the engine leave little to be esired, and its hill-climbing powers were marvellous; ut the road vibration, especially over rough patches, as particularly noticeable when compared with my wn heavier mount. No doubt building a machine ith a longer frame, longer handle-bars, and fixing a ig saddle, footboards, and larger tyres would over-ome this to a great extent, but it would then be sacri-cing its claim to be called a lightweight, and it is ist these things that help to absorb vibration and go make the heavier machine more comfortable.

My own mount is fitted with very comfortable foot-boards, big saddle, long wheelbase, and very long handle-bars, and I have never felt the slightest fatigue after being in the saddle all day; but I venture to say I should not feel as fresh after riding a lightweight for the same time. I found there was no comparison with the light machine when riding over the same roads on my own heavy twin. I therefore cannot agree with Mr. Hooydonk's remarks in his letter [3196] that "a lightweight machine is to-day more comfortable than a powerful twin."

Ease of Control.

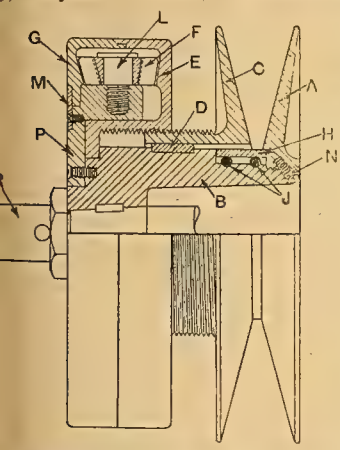
With regard to the ease of control, which is another point the lightweight champions emphasise, I have never found the slightest difficulty in controlling my machine in traffic, one reason perhaps being that I employ a lower gear than is generally thought indispensable on a twin, and can run at six miles an hour with both cylinders firing; this with magneto ignition.

One particular point I consider to be dead against the popularity of the lightweight is the round belt transmission and jockey pulley, but as this will be improved upon I will say nothing further with regard to it.

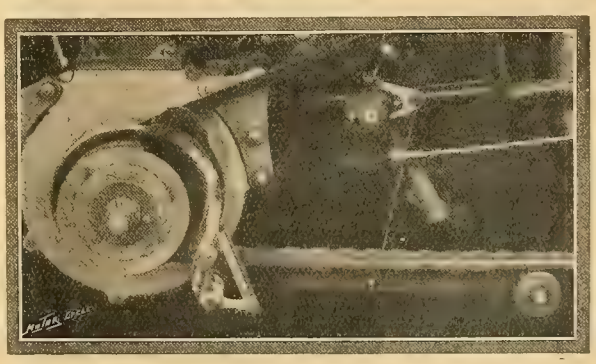
The lightweight has undoubtedly many advantages, and, as pointed out in your columns recently, will do excellent work in bringing fresh recruits to the pastime; but for those who have had some experience of motor cycling I think it will be a very long time before the lightweight supersedes the heavier twins and singles as all-round touring machines. C. E. T.

ANOTHER VARIABLE SPEED PULLEY.

THE number of variable speed pulleys now on the market is becoming quite remarkable. An ingenious device of this type has lately been introduced by Messrs. Defiance Motors, Ltd., 9, Laystall Street, Clerkenwell Road, E.C. The chief advantage of this gear is that it can be changed with ease, is easily applied, and simply constructed. Referring to the line illustration in section, it will be seen that the main boss B is bored to fit the pulley shaft of any engine. The fixed flange A is screwed up against a shoulder and held in place by a grub screw N. The movable flange C is bored to slide laterally on the main oss, but is prevented from turning by the feather D; is also threaded externally, and a bevel wheel E is reaeded internally to screw into it. This bevel wheel mounted on the main boss in such a manner that it an rotate thereon, but cannot move laterally, and a econd bevel G is similarly mounted. The bevel pinions F are mounted on studs L, which are carried by the disc P. This disc is fastened to the main boss, and the pinions are free to rotate on the studs, and are always in mesh with both bevel wheels. Two pedal brakes are provided for applying to the outer surface of the bevel wheels. When one pedal brake is pressed the rotation of one of the bevels is arrested, with the result that the pulley expands. If pressure is taken off the pedal the flange remains where it is. If pressure is put on the other pedal and the rotation of the other bevel is arrested, the flange contracts. When the low gear is being applied the belt tension is kept up by means of a jockey pulley. When the flange C is fully expanded the ring J which runs on ball bearings is exposed, and on it the belt runs.



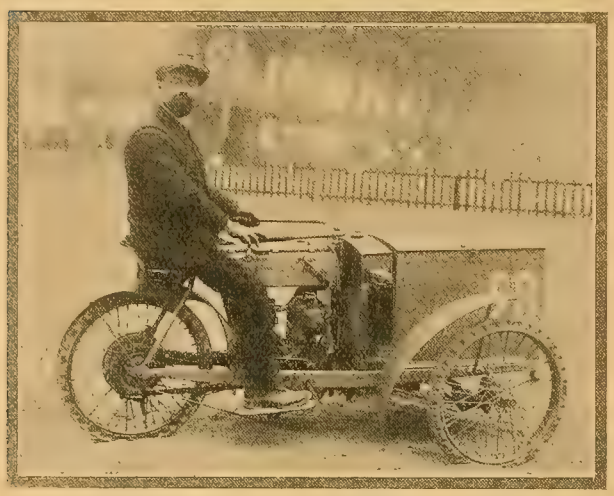
Part sectional drawing of the Defiance variable speed and free engine pulley.



The Defiance Variable Pulley, showing jockey pulley and two pedal brakes.

Tricars for Industrial Purposes.

INCLUDED in the French Industrial Vehicle Trials which are now being held (full particulars of which are published in the current issue of *Motor Traction*) are two of the well-known Mototri-Contal machines. Our illustration shows one of these tricars with its French driver at the wheel. Both



A Mototri-Contal in the French Industrial Vehicle Trials.

machines are fitted with single-cylinder engines, chain transmission, and channel steel frames. The box in front is constructed to carry a weight of 112 lbs., the water tank being situated at the rear of this box with the radiators projecting one at each side. Both machines are fitted with Ducasble solid tyres. The daily average journey which these vehicles are accomplishing in the trials is about eighty-eight miles. The competition closes on the 31st inst.

The B. F. Goodrich Co., 7, Snow Hill, E.C., the makers of the Goodrich rubber studded tyre, regret there has been delay in delivering tyres and retreading covers. They are now in a position to deliver and execute orders for retreading any cover promptly.

The Service Company, Ltd., of 292, High Holborn who are agents for the Rex motor cycles, inform us that these machines are selling very freely in the London district, the lightweight in particular being very much in demand. Large numbers of this make of motor cycle were sold just before the Easter holidays, and the reports received from their owners are most satisfactory

We have received a sample of tyre filling compound from J. E. Savage, 119, Donegall Street, Belfast. The compound is of a jelly-like substance. To fill the air tube the composition is merely heated, when it becomes liquid, and can be pumped into the air tube with an ordinary two-way pump. For motor cycles it does not require to be pumped to too great a pressure, as this destroys the resiliency of the tyre. It is claimed that anyone can fill his own air tubes, and once filled the tyre is ready for riding in twenty-four hours. To fill a motor cycle tyre 2in. in diameter, 4 lbs. of the composition are required.

Weighing one of the competitors in the M.C.C. Members' Hill-climbing competition at Sharpenhoe on the 2nd inst.

A group of competitors at the foot of the hill. The two riders in the foreground are W. A. Sale (3½ h.p. Rex) and Percy H. Trotman (3½ h.p. Triumph).

Being the opinions of medical men who are actual users of motor bicycles or tricars.

(*Continued from page 379.*)

. E. St. L. Finney, J.P.

I use an 8 h.p. De Dion tonneau car or my medical work. I have also got Minerva motor bicycle. I consider otor cycling a most healthy pastime. do not use a motor cycle for profes- onal work at any time, as I consider he motor car is better suited for town ork.

C. Lapage, M.D.

(1.) Since I used a motor cycle I ave been free from muscular rheuma- ism, and I attribute this to the vibra- ion, which has a somewhat similar ffect to that of massage. (2.) I have veraged 3,000 miles per annum in isiting patients, and also in tours for leasure. (3.) The cost of motor cycling s very much cheaper than that of eeping horses or of running a car. I stimate it at one-third. Though I ow have a car I use the cycle in pre- erence in fine weather. (4.) A light- veight motor cycle with magneto and -belt and variable gear if the country e hilly.

.B., B.C.

The alleged evil results to health rom motor cycling are mysterious ervous diseases from vibration affect- ng the spinal cord and dilatation of he heart from severe muscular exertion n starting or helping up stiff gradients. The first must be very rare, and, like he second, must be due to the unskil- ul use of an unsuitable machine. A otor cycle in good order, geared to uit the district, ridden intelligently, will improve the health of the rider. Racing or scorching on the average ountry road is prejudicial to the health by necessitating incessant watch for possible dangers and causing exhaustion instead of gentle exhilaration

R. A. Johnston.

While considering motor cycling a very healthy pastime, it is not as such that it appeals to me, but as a pleasant, speedy, and reliable means of doing my daily rounds in outlying country districts, for which I use it irrespec- tive of weather. Especially in urgent and night cases is the convenience of the motor cycle noticeable. A good 3½ h.p. with magneto ignition is my idea of a suitable machine for a medical man. With intelligent care it is always ready for immediate use, while its upkeep will not be one-third that of even one horse and trap with which one could not do anything like the same amount of country work.

E. B. Thamsen (Denmark).

Having used a motor cycle since spring, 1903, I may say at once that I have always found it a really healthy and exhilarating pastime in winter as in summer. A motor cycle is invalu- able for a doctor on busy days and in urgent cases, and it is by far cheaper than any other method of locomotion, push-cycle excepted. As to the most suitable type of motor cycle for doctors' use, I may say at once that owing to Danish legislation, and to the roads in this region of the kingdom, I do not think a tricar would be practical, and I am really satisfied with my present mount, a 3½ h.p. single-cylinder N.S.U. with magneto, spring fork, two-speed gear, etc., which for fully three years has done its work almost every day in the year, and proved itself to be an ex- tremely reliable and efficient machine (two-speed gear since 1906).

C. H. S. Vinter, M.R.C.S. Eng., L.R.C.P. Lond. B.A. Cantab.

My present mount is a 1906 3½ h.p. Quadrant fitted with 1908 Roc clutch and two-speed gear, and Brown and Barlow carburetter with handle-bar control. I use machine to assist in my practice, particularly for night work, also on holiday. Last summer I took a friend in my trailer through Brittany, but found the necessity for a two-speed

Dr. C. H. S. Vinter.

gear. Consider it most valuable from a health point of view. With really effective spring forks (such as Quad- rant), footrests, and a Brooks B100 saddle, there is no tired feeling after a long run. Other essentials to my mind are 2¼in. tyres and separate stand and luggage carrier.

J. Ellis Crisp, M.R.C.S. Eng., L.S.A. Lond

(1.) Cures dyspepsia and defers old age. Think it would be better for the health and brains of every man not an invalid or an imbecile to get a motor cycle if he can afford it. (2.) Provided good roads and good weather, not to be expressed in words. (3.) As cheap, comparatively speaking, as a club man's payment for medical attendance. (4.) Depends on locality. Personally, I prefer 3½ h.p. Have dropped £15 on a two-speed gear. Waiting till I see a satisfactory one on a friend's machine, when may invest again.

B. Pope Bartleet, M.R.C.S.

(1.) For five and a half years I have done all my work on a motor cycle, rid- ing day and night, all weathers (aver- age about 120 miles a week), and have enjoyed excellent health. I should, however, advise warm clothing, especi- ally for night work. (2.) With a reasonable amount of attention a motor cycle is convenient, speedy, and reli- able, and always ready at a moment's notice. (3.) I used two horses for fif- teen years, and I consider the upkeep of two motor cycles about equal to that of one horse. (4.) Single-cylinder 3 h.p., light and strong, and an easy starter, Palmer covers, and protection from rain and mud where possible. I have used four different machines, but the 1903 Rex, which is still going well, I consider the most reliable.

D. J. S. (Ireland).

I consider motor cycling to be a very healthy and exhilarating exercise. Until one gets accustomed to it, and expert in the management of the machine, the strain resulting from hav- ing to be constantly alert and wide- awake is tiring, and may be harmful. I have been using motor bicycles in my professional work for the past six years, and I would not be without one—until I can afford a good car—as apart from the pleasure it gives, it saves a lot of time in a long-extending country practice, and the expense, beyond the initial cost of the machine, is trifling, and bar Shanks's mare and push bicycle, much cheaper than any other form of locomotion. The motor bicycle is, however, essentially a fine weather and daylight machine. My ideal motor bicycle is a 3½ h.p. single-cylinder machine, with low and well-sprung frame, magneto ignition, two-speed gear or adjustable pulley, and rubber and canvas belt.

OCCASIONAL COMMENTS.

By "IXION."

Rubber Belts.

I want to know if any rider has ever suffered from a mischance that befell me a week or two ago. I was out with a brand-new rubber belt, on new pulleys of correct angle, and a heavy storm came on. As soon as the belt got wet, I had a free engine as soon as I struck a hill. No matter how I mopped the belt and the pulleys, the belt slipped on the engine pulley as badly as if it held a free-wheel both ways concealed in its inside. I do not often ride with rubber belts, but this has never befallen me before, and I shall be glad to learn from a rider of greater experience with them how such an awkward mischance is to be dealt with, and what is the explanation of it.

Fasteners for the same.

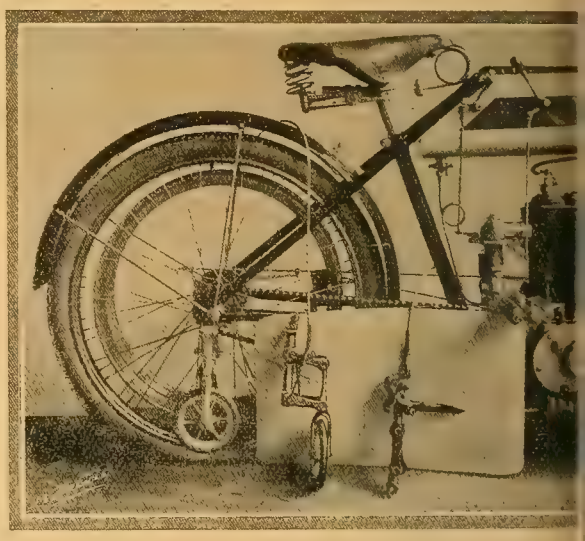
Many riders have told me their one complaint against rubber belts is that when the days of shortening come the fixing of the fastener is more difficult than the same job applied to a leather belt, and the difficulty of this is almost as disagreeable as the dirtiness of the same operation with leather. These riders will no doubt be pleased to hear that Mr. Lycett has brought out a new rubber belt fitted with his patented eyeleted system of hook fasteners, which have been found such a boon on the leather variety. Mr. Lycett's belt contains other features of interest. The fabric core is of the very identical "airless cord" of which the famous Palmer cord tyres are made, a layer of rubber intervening between the layers of cord to prevent chafing by friction. In addition, the belt is grooved on both top and bottom, and may therefore attain a higher degree of flexibility than standard patterns. I say "may" advisedly, because stiff as rubber belts appear to be when bought out of stock, they soon lose their rigidity in actual work upon the road. (Lest there should seem to be a connection between this paragraph and the last, relating to slip of a wet rubber belt, I may add the belt which held me up was not a Lycett.)

A Suggestion in Quadcars.

I think we are all a little disappointed at the very limited vogue of the several patterns of light four-wheeled motor cycles that have been brought out, and I am convinced that the specification of these vehicles and the high price a good specification necessitates have been militating against them. Let some maker produce a strong, simple chassis with few refinements, keep the price as low as he can, and see what sort of a demand rewards him. We have to remember that in parts of America where the roads permit, vehicles of this sort have a great vogue, and that amongst persons not originally very promising as motor buyers. A host of refinements—governors, magnetos, gauges, and so forth—wreck the prospects of such a machine before it is marketed at all. However charming they may make it to handle, they lift its price to within £10 of that charged for a regular car, and the purchaser springs another tenner and gets his side by side bucket seats, and so on. The sort of vehicle I mean would be destitute of fal-lals of any sort, and consist of two axles, a "deck" or "buck-board" platform carrying a seat which depended for its comfort more on accuracy of dimensioning tha luxury of upholstering, a good simple engine, ca buretter and ignition, simple brakes, simple two-spee gear, simple transmission, and so forth. Such quadricycle should be produced in quantities for abo £70, and would have a great sale if its meri were once proved. It is no use throwing anythin on a crowded market, and then leaving two or thre private customers to advertise it. There is at prese a huge class of motorists desiring passenger machine and unwilling to expend more than £75 on a moun Some of them buy second-hand tricars, some b second-hand single cylinder voiturettes, and some them abstain. This class is likely to exist pe manently, and the light up-to-date car of standa design will never fall in price sufficiently to suit then They are not catered for at the moment, and they a waiting with their purses in their hands.

The Hill-climb of the Year.

Nothing in my motor cycling memories has given n more joy than to learn that the A.C.U., in conjunctio with the Newcastle and District Motor Cycle Club, promoting an open hill-climb at Sutton Bank on M 30th. It will be the function of the year witho



The latest pattern Jack-no-Skid as supplied by Horner and Co., Store St. Tottenham Court Road. It will be noticed that this is a very much neate article than any previous pattern.

doubt, and the proviso that the winner in each cla will be the machine "that travels farthest up the hill is a wise one, though the results will be decepti unless the ratio of gear is stated on the entry form a checked before the start, as few machines will be fitt with the manufacturers' standard gear. One adva tage of the hill is that from the foot the heads of t riders are visible above a low turf parapet as they s mount the concluding pitch, and a very fair notion comparative pace can be obtained thence. I a sorry to see that the maximum weight of twins wi 76 mm. bore is set at 200 lbs. One or two winni machines of last year especially suited to this hill a debarred by this proviso.

QUESTION & REPLIES.

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street. E.C., and, whether intended for publication or not, **must be accompanied with a stamped addressed envelope for reply.**

Leakage at Inlet Valve Dome.

I am troubled by a leakage through seating of inlet valve of my N.S.U. machine, not through valve which is quite tight, but through seating of valve casting in cylinder head. Kindly say how I can cure it.—SN 161.

You might try fitting a new copper and sbestos washer, as soft as possible, and f this does not cure the leakage, have asting examined; it may be distorted y heat, or there may be a piece chipped ut of the casting, so preventing a roper joint.

Registering New Machine and Suggested Tour.

(1.) Is it correct that I may register my tricar at any council office, therefore by applying to an out of the way place I should get a small distinguishing number? If so, would you kindly suggest a place where there are very few motors? (2.) I intend going for a seven days' tour in June, and should be pleased if you would suggest one. I am quite an inexperienced driver at present, so should like an easy unfrequented route.—H.S., Catford.

1.) Yes, you may register a new motor t any County Council offices. You ight try County Sligo, Ireland; County Roscommon, Ireland; or the hetland Islands. (2.) If you care to ap out a tour roughly we will tell you f it will be suitable if you give us particulars as to the horse-power of your achine, and how far you care to ride aily.

Route to Devonshire and Stoppage of Petrol Supply.

(1.) Kindly inform me the best route to Exeter, and on to Kingsbridge, in Devonshire? (2.) Also please say cause of 1906 3 h.p. N.S.U. machine, which previously ran well with fixed air half open and throttle tube air regulator half open, suddenly refusing to go unless fixed air is entirely shut and adjustable air almost shut? —F.A.R., Brixton.

1.) Your best route would be Basingtoke, Salisbury, Shaftesbury, Honiton, Exeter, Chudleigh, Newton Abbot, Totnes, and Kingsbridge. (2.) The trouble is probably due to a stoppage in the carburetter impeding the low of petrol.

Restoring "Life" to an Engine.

Can you tell me how to remedy the following faults in my 4 h.p. magneto Antoine, Fit-all two-speed gear: Knocking while picking up speed. Does not respond to throttle up-hill. Racing on low gear with full gas, and stopping on low gear with half gas. Unable to do more than twenty-five miles per hour on level (4½ to 1 gear). Although I can start at a walking pace, and the engine fires regularly, it is not responsive to levers till well under way. Would raising the level of petrol in jet cure above faults? If so, how shall I set about doing it?—J.F.M., Birkenhead.

From the symptoms described in your letter, the engine may be suffering from

Mr. B. H. Davies, on arrival at a friend's house after a "breakfast" run of 75 miles, covered by 8 a.m., without a stop. The machine is a 3½ h.p. Triumph.

two faults. Firstly, it may be very foul inside, and requires to be cleaned of all carbon deposit. Secondly, the carburetter may not be receiving sufficient air at high speeds, and not enough petrol at low speeds. Raising the level of the petrol might cure the trouble. This is done by slightly lowering the weight on the needle valve. If you are unable to effect an improvement fit a new fibre ring.

Adjustment of Contact Breaker.

Please tell me how I can cure misfiring on my 3½ h.p. Rex motor bicycle? The compression is excellent and valve springs good, the mixture correct, and the accumulators charged. After starting and getting up a speed of about 15 m.p.h. the missing commences, but disappears on resuming a slower rate. There is plenty of petrol and oil.—S.H., Herefordshire.

It is almost certain that a half turn of the platinum screw on the contact breaker to the right will cure the misfiring on your machine at higher speeds than 15 m.p.h. Other causes of irregular running are, wires chafed through the insulation, platinum points pitted, cracked porcelain of plug, and incorrect carburetter adjustment.

A Novice's Difficulty in Starting.

I find a difficulty in starting my new magneto Motosacoche when on the road. I obtained it recently, and have had it going a few times on the stand, but it refuses to start on the road. I have worked it in exactly the same way on the road as I worked on the stand, and commence as follows: Turn on petrol, flood the carburetter, inject a little paraffin into the compression cock, close the latter and lift the exhaust, pull the throttle wide open and then commence to pedal. When nicely going I drop the exhaust and fully advance the spark, and if on the stand it starts. On the road I've tried going down a slight incline at a fair speed with spark fully advanced. Would you advise injecting a small quantity of petrol into the cylinder?—H.B.

The best position of the spark lever of a magneto has considerable influence on the ease of starting; the usual position of this is just short of full advance, also care must be taken that the sparking plug points have a gap not greater than 1-64in. Yes, you might try a little petrol injected into cylinder and see if this makes any improvement. Also be careful to see that the air is closed before starting, and then open the lever when under way. You do not state if the engine refuses to fire while turning, or if the compression of the engine causes the belt to slip over the pulley. If the latter is the case, you must adjust the belt tighter.

READERS' REPLIES.

Magneto Refuses to Spark.

Having had similar trouble to that described by "Rev. H.N." in *The Motor Cycle* for May 6th, page 369, I would like to recommend the fitting of Albo Luthi sparking plugs, careful cleaning and adjusting of the contact breaker so that the points open fully 1-16in., opening and closing like the tapping of a small hammer, and, most important of all, tightening the actuating rod of the Roc clutch. The clutch pedal must be operated very gently, *i.e.*, the machine should begin to move when operating lever is half depressed, and get under way before pushing pedal home. Make sure that magneto is properly timed. The cog on engine might have slightly altered its position with a jar or knock by accident. We had quite a circus with our 1907 5½ h.p. Rex de Luxe until the details mentioned were attended to. Now it is one of the finest machines on the road.—HAD SOME.

Valve Cap Joints.

With respect to the letter of "W.S.S." (page 369 of *The Motor Cycle*), who has difficulty in getting his valve caps gas-tight, he will find that this is due to the flanges on the caps not being wide enough. This has been remedied on the later models, and caps with wider flanges can be procured from the Minerva Co.—T. W. WORRALL.

IMPORTANT.

Our readers are reminded that all letters requiring an answer must be accompanied by a stamped and addressed envelope. These queries are never published unless they contain matter which is of general interest. No exceptions are made to the above rule except in the case of some foreign and colonial correspondents, who cannot obtain international reply coupons.

A meet of the growing Hull and East Riding Auto Cycle Club. We commend the photographer on the novel method of taking the picture.

THE TOUR DE FRANCE.

MOTOR CYCLE AND VOITURETTE RELIABILITY TRIALS.

(*From our Paris Correspondent.*)

ON Monday morning, May 11th, the Tour de France organised by the Auto Cycle Club de France for motor cycles and voiturettes commenced under ideal weather conditions. Although the hour of starting (7 a.m.) was early, the majority of the competitors and a host of friends were well on the scene some time beforehand, but this was probably due to the glorious morning and the hopes of a splendid run by the entrants.

The Weighing In.

Saturday morning, May 9th, witnessed the weighing-in of the machines and the official sealing and stamping of the various parts at the Levallois works of Messrs. Bayard-Clément, and it was interesting to note the irregularity of the arrival of the competitors as compared with similar affairs in England. It struck me that French motor cyclists are devoid of that comradeship and fraternal feeling which exists in English motor cycle circles. The competitors dribbled along in ones and twos, had their machines stamped and sealed, and went off again, as if the whole proceeding was an everyday occurrence. Frenchmen are always loth to give information, especially to pressmen, as they have a dread that they should be called upon to pay for it, and this year's Tour de France was no exception to the rule.

The machines on the whole were all of serviceable build, mostly with low frames and medium length handle-bars. All except the two Werners (Nos. 11 and 13) were fitted with Longuemare carburetters, the Werners having their own make of carburetter attached. The machines were divided into two classes, Class I. being for motor cycles with engines having a quarter litre capacity (or 250 cubic centimetres), and Class II. for motor cycles having a cylinder capacity of 210 cubic centimetres. Tricars came under Class III., and these machines had a maximum cylinder capacity of half a litre (500 cubic centimetres).

The parts that were stamped were the cylinder, the crank case, the cylinder head, the carburetter, the forks, and hubs, and to have changed any of these parts during the tour would have entailed disqualification.

The Entries.

The following motor bicycles and tricars were on the 9th inst. officially entered as starters:

Class I.—No. 1 (Quentin), No. 3 (Lurquin-Coudert), No. 4 (Peugeot), No. 6 (Lurquin-Coudert), and No. 7 (Peugeot).

Class II.—No. 10 (Alcyon), No. 11 (Werner), No. 12 (Griffon), and No. 13 (Werner).

Class III. (tricars).—No. 16 (Du Furan), No. 17 (Souriau), No. 19 (Bérujeau), and No. 20 (Du

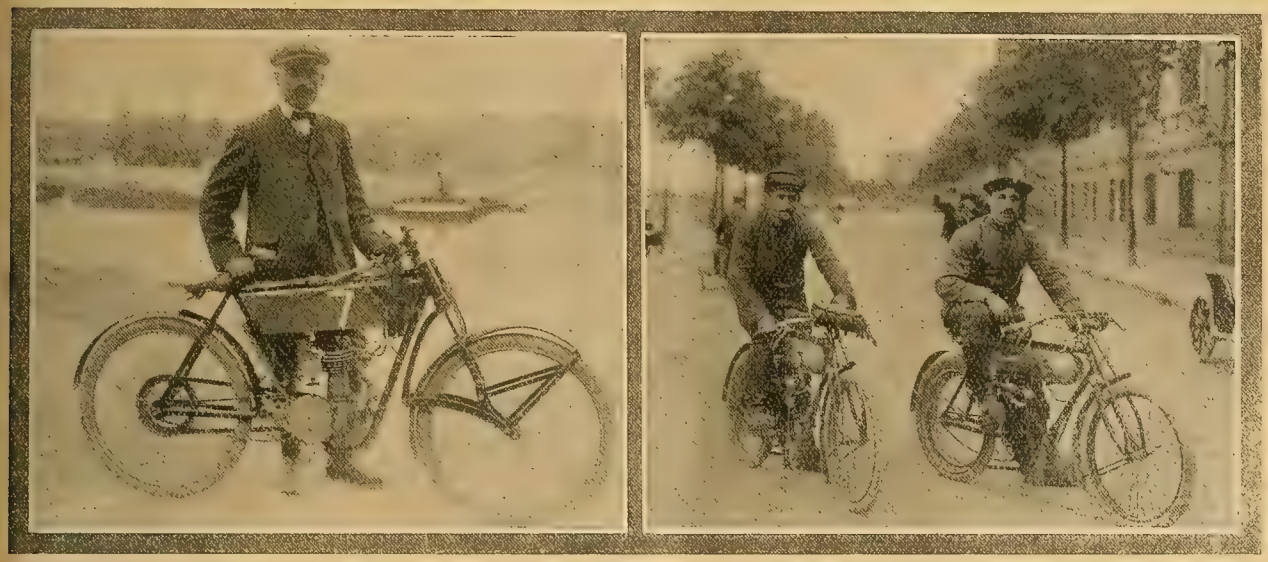
The Tour de France.—

Furan. All these machines made their appearance on Monday morning in full travelling order.

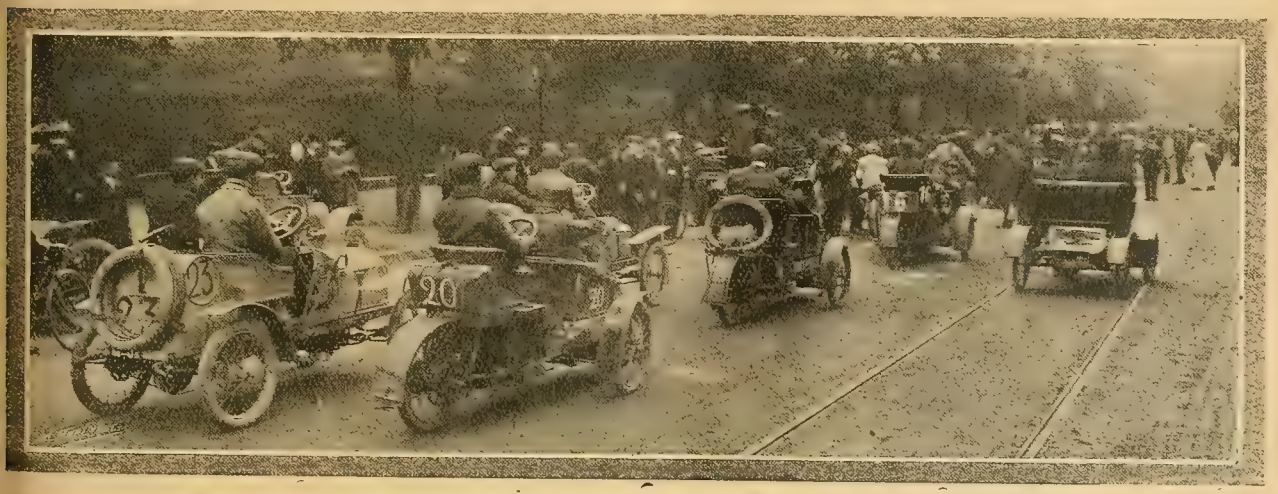
Promptly on the stroke of seven on Monday morning the motor cycles were despatched in pairs as follows: Quentin (No. 1) and Lurquin-Coudert (No. 3). They were followed one minute later by Peugeot (No. 4) and Lurquin-Condert (No. 6). The Peugeot (No. 7) went off at two minutes past seven. The four machines in Class II. were also sent away in quick succession, Alcyon (No. 10) and Werner (No. 11) starting with the Peugeot (No. 7). The Griffon (No. 12) and the Werner (No. 13) were despatched at three minutes past seven. The tricars in Class III. were the next to leave, the Du Furan (No. 16) taking the lead at 7.4, Du Furan (No. 18) at 7.6, Bérujeau (No. 19) at 7.7, and the Du Furan (No. 20) at 7.8.

The Itinerary and Penalties.

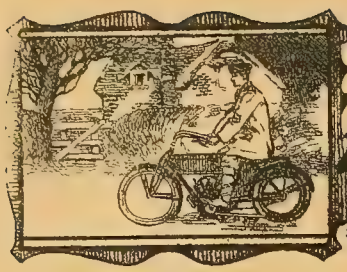
The trials finished at Paris on Sunday last, the whole journey having been some 930 miles. From Paris to Dijon (about 200 miles) was the first day's run; Dijon to Clermont-Ferrand (about 175 miles) the second day; on Wednesday speed tests were carried out on a course just outside Clermont-Ferrand; Thursday witnessed the journey from Clermont to Limoges—120 miles; Friday from Limoges to Bordeaux—135 miles; Saturday from Bordeaux to Tours—202 miles; and on Sunday from Tours to Paris—140 miles. The minimum average speed arranged was 15½ miles an hour. For every thirty seconds a machine arrived late each day a penalty of one point was inflicted, and, of course, as before stated, if it was found necessary to change any of the parts stamped, the machines were fully penalised. One of the Werner riders collided with a horse on the first day, and his machine was damaged so badly that he had to retire. Fortunately, he was not badly hurt. One of the Lurquin-Coudert riders was also the victim of an accident on Tuesday, he having been run into by a dog and upset. The other Werner rider accomplished a speed of twenty-five miles an hour average from Paris to Dijon with an engine of 210 c.c., less than a quarter litre capacity. The complete results will be given in due course.



Three of the motor cycle competitors in the Tour de France. Pons (Peugeot) on the left, and the two Lurquin-Coudert riders.



The Tour de France. Start of the tricars and voiturettes from the Porte Dorée, Paris, on Monday, May 11th.



CURRENT CHAT.

SPECIAL FEATURES.

WEEK END EVENTS (ILLUSTRATED).

THE TOUR DE FRANCE RELIABILITY TRIALS (ILLUSTRATED).

The Number of Queries.

One single morning last week our post bag contained no less than forty-four queries from readers.

Noting the Numbers.

We noticed the A.A. scouts on the Tonbridge and Maidstone roads entering the number of every car and motor cycle that passed last week. This proved so effectual in checking speed that all the traps were withdrawn on these roads. Bravo! A.A.

New Police Traps.

A trap is in operation in Parkside, Wimbledon Common. It starts at the Wimbledon end of Parkside and extends for 220 yards towards Putney. Also a trap is being worked in Wimbledon Broadway, and in Morden Road, South Wimbledon.

Two Trials on Sutton Bank.

The competition arranged by the A.C.U. for the 30th inst. is not the only hill-climb to be held on Sutton Bank this year, for, as we announced some weeks ago, the Leeds M.C.C. will hold a competition on the same hill for the Grange Trophy on June 23th.

Ware Cheshire.

Nearly forty policemen are being added to the force of the Cheshire County Constabulary. It is stated that the increase is due to the complaints respecting inconsiderate driving of motor vehicles.

A.C.U. Associated to the R.A.C.

Mr. Robert Todd reported to the R.A.C. General Committee at Nottingham, on the 9th inst., that the Auto Cycle Union had now arranged the terms of its severance from the Motor Union, and the A.C.U. and its affiliated clubs would now become associated under the R.A.C. scheme.

Congress of German Motor Cyclists.

The Grand Duke of Hesse has accepted the protectorate over the German Motor Cycling Congress to be held on the banks of the Rhine during the forthcoming Whitsuntide.

American Air-cooled Car for Brooklands.

A 50 h.p. Frayer-Miller car, owned by Mr. Jack Darwen, of Bromley, will be the first car with air-cooled engine to appear at Brooklands. The cylinders are provided with a covering through which a draught is projected by means of a fan driven from the crankshaft. The chief feature is the horizontal fitting of the valves.

Birmingham to Coventry Road.

£15,000 is to be spent on the Birmingham to Coventry Road in widening it and improving the surface and foundation.

An Acknowledgment.

We have been asked to state that the drawing on page 347 of the Spring Number, entitled "All Out," was worked up from a photograph of Mr. B. Richardson Billings's motor bicycle and sidecar, which was published in *The Motor Cycle* of November 20th last, page 929, the registered number of which is 520835.

FUTURE EVENTS.

May 30—Auto Cycle Union Open Hill-climb on Sutton Bank, Yorkshire.
" 30—"Sport and Play" Motor Cycle Races, Aston Villa Grounds, Birmingham.
June 5-8—M.C.C. LONDON-EDINBURGH RUN and return for Schulte Cup Competition, and Special Cup for Motor Bicyclists.
" 6-8—Brooklands A.R.C. Whitsun Meeting.
" 20—Entries close for M.C.C. Team Competition at Daventry.
" 27—M.C.C. INTER-TEAM TRIALS for "The Motor Cycle" Fifty Guineas Challenge Cup. Prospective competitors: Motor Cycling Club, Coventry M.C., Great Yarmouth M.C.C., Birmingham M.C.C., Lincolnshire M.C.C., and Liverpool M.C.
" ——A.C.U. 24 Hours' Ride.
July 4—Essex M.C. Open 200 Miles Non-stop Run.
" 4—Brooklands A.R.C. Meeting.
" 6-7—A.C.F. Grand Prix Races for Cars.
" 13-18—A.C.U. LAND'S END TO JOHN-O'-GROAT'S SIX DAYS' RELIABILITY TRIAL.
" 14-15—M.C.U.I. (Ulster Centre) Open 400 Miles Reliability Contest.
" 25—Motor Cycling Club's Petrol Consumption Tests.
Aug. 3-4.—M.C.C. Run from London to Land's End and back for Charles Jarrott Cup.
" 8—Essex M.C. Open Race Meeting at the Stadium, Shepherd's Bush, W.

The Ubiquitous Motor Cycle.

At a recent inquest at Leadenham, Lincolnshire, the coroner, Dr. C. H. D. Robbs, rode to the inn on his twin-cylinder N.S.U. motor bicycle. Not only so, but a solicitor, Mr. C. Nelson, and one of the witnesses, Mr. F. Norton, also journeyed to Leadenham on motor cycles.

New Clubs for the M.C.C. Team Trials.

Two more clubs intend sending teams to compete for *The Motor Cycle* fifty-guineas challenge cup, viz., the Lincolnshire M.C.C. and the Liverpool M.C. The Lincolnshire club may be represented by more than one team of six riders. Other clubs that have not decided whether to take part in this interesting competition should remember that if the Coventry M.C. win again this year the cup will become its absolute property.

Motor Cyclists in Warfare.

As in 1907, members of the Germa Motor Cycling Association will partic pate in this year's Imperial manœuvre the scene of which is Alsace; but in stead of twenty riders, the number participants in 1907, the War Offi calls for 100. This increased deman for motor cycling volunteers is signi cant of the high opinion formed b German military men of the practic value of such machines for purposes war.

M.U. Whitsuntide Tour.

The Motor Union is organising a pe sonally conducted tour to t Valley of the Loire at Whitsu tide. Agents of the M.U. w make every arrangement for t convenience of the tourists, a an expert courier will accompa the party during the entire tou It is estimated that the total e penses per head for the fourte days will reach £21 6s. 8d., e clusive of the running costs the vehicles, whether car or mot cycle. The charge for joini the tour is £1 1s. per head, a members who intend taking a vantage of the arrangemer should communicate with t secretary, W. Rees Jeffreys, Albemarle Street, W.

The A.C.U. Sutton Bank Climb.

There should be no dearth competitors in the A.C.U. op hill-climb at Sutton Bank. Co petitions promoted by the Ne castle, Leeds, Bradford, Sheffie Hull, Hartlepools, Middl brough, Scarborough, Sund land, and York County Mot Cycle Clubs are always well su ported, and the members shou welcome the opportunity of competi with the Southern and Midland e perts. We would remind those w intend riding in any of the nine clas on the programme that entries must received by the A.C.U. secretary Saturday next.

Track Race in Hanover.

On Sunday next, the 24th inst., t Hanover Motor Club will hold a ser of motor cycle races on the Hano track (Sport Platz). The track is modern cement one of 500 metres c cuit. Event 1 is a ten kilometre r for light motor bicycles under 100 l Event 2 is a ten kilometre race for to ing motor bicycles. Event 3 is a r over one kilometre, and the organis offer in addition to two cups, a spec prize of £5 to any rider who beats t track record for the flying kilomet which stands at 37⅗s.

A Lancashire Police Trap.

The Rainford County Police are working a trap on the main Southport Road, just outside St. Helens, over a 440 yards downhill part of the road.

Success of a Lightweight.

The Lyons Limonnet Hill-climb resulted in a win for Pelissier on a Motosacoche in 4m. 59s. Brissaud was second on a similar machine, while Barber, who also rode a Motosacoche, occupied fourth place. The course measured three miles in length, and the gradient is seven per cent. to nine per cent.

The Annual Mont Cenis Hill-climb.

Our Italian contemporary, *La Stampa Sportiva*, is again to the fore with a silver challenge cup for the motor cyclist making fastest time over the 1 in 10 gradient between Susa and Moncenisio, which measures about fourteen miles. Every rider finishing inside limit time of one hour receives a silver medal. The competition is fixed for the 14th prox.

The Cycle and Motor Trades' Benevolent Fund.

All provident members of the cycle and motor industries should enquire of the advantages of membership to the Cycle and Motor Trades' Benevolent Fund. The general hon. sec. and treasurer is Mr. A. J. Wilson, 154, Clerkenwell Road, E.C., and forms of application for membership can be obtained from him.

A.C.U. Open Hill-climb at Sutton Bank.

Sutton Bank, the venue of the A.C.U. annual open hill-climb on Saturday week, is five miles out of Thirsk, on the road *viâ* Helmsley and Pickering to Scarborough. Only two or three motor bicycles have up to the present made a clean ascent of the hill. When the pick of the Southern, Midland, and Northern riders have met at this famous Bank, probably a different tale will be told.

The Next Brooklands Motor Cycle Race.

A motor cycle race has been included in the Whitsuntide meeting of the Brooklands A.R.C. for commissioned officers in His Majesty's Navy. Particulars will be announced at a later date. There will be no other motor cycle race at this meeting, possibly owing to the M.C.C. London to Edinburgh Run and return falling on the same date. This event would no doubt have affected entries for a race at Brooklands considerably.

The Abuse of the Motor Horn.

On the occasion of the first provincial meeting of the R.A.C. General Committee at Nottingham, a letter was read from the Sheffield and District A.C. in regard to the use of the motor horn on pedal cycles. After considerable discussion it was agreed to write a suitable letter to the secretaries of the National Cyclists' Union and the Cyclists' Touring Club on the matter.

Our Petrol Supply.

Petrol imports during April reached a total of 1,941,559 gallons as compared with 3,200,328 gallons in April, 1907, and 1,367,213 in the same month of 1906. For the four months ended 30th April the number of gallons imported were :

1906	1907	1908
7,179,659.	9,658,383.	7,814,247.

A Short Run.

John Rawlingson, 25, motor fitter, was brought up from Maidstone prison in the custody of a warder and charged at the Westminster Police Court on Monday of last week with stealing a motor cycle belonging to Joseph Fox, of Eaton Place, S.W. The prosecutor advertised his motor cycle for sale, and was waited upon by prisoner, who represented that he was sent by a Mr. Frost to examine the machine, with a view to purchase. The prisoner was allowed to test it by a "short run round," but he disappeared, and failed to return. He is at present undergoing a sentence for another offence, and the police proved previous convictions. Mr. Horace Smith committed the accused for trial.

A Novel Suggestion.

"Cheshire," Belfast, makes a suggestion with regard to a competition. He says that he has been amusing himself by cutting out the illustrations in *The Motor Cycle* advertisements and assembling them on paper into a complete machine. He claims to have produced some splendid results in the way of an ideal motor cycle by embodying the frame of one make, engine of another, gear of another, etc. He thinks this would be an ideal form of competition. We beg to thank "Cheshire" for his suggestion, but at present we have no intention of promoting another competition. Some readers may like to amuse themselves with the idea, and we shall be interested to see their efforts, and to publish anything of real merit.

Motor Cycle Races at Birmingham.

The *Sport and Play* meeting at the Aston Villa Grounds, Birmingham, is on Saturday next, the 23rd inst. Several motor cycle races have been included in the programme, including a series of matches between three of the best known racing motor cyclists.

The Tour de France.

On Sunday last the following motor bicycles and tricars arrived in Paris, having completed the 930 miles of the Tour de France, organised by the Auto Cycle Club de France : Class I., No. 3 (Lurquin-Coudert), No. 4 (Peugeot), No. 7 (Peugeot). Class II., No. 12 (Griffon), No. 13 (Werner). Class III., No. 19 (Bérujeau). See pages 402-403.

The Motor Cycling Club Team Competition.

In connection with the above contest, Mr. J. Van Hooydonk, Trials hon. secretary, Spring Villa, High Road, Finchley, N., will be away in Ireland until May 30th, where he will drive a Phœnix light car in the Irish A.C. Reliability Trials. Club secretaries who write regarding the Team Competition will receive a reply immediately he returns.

Simms Manufacturing Co. v. Bosch.

This action was set down in the King's Bench Division of the High Court before Mr. Justice Lawrance and a special jury, and Wednesday, the 13th May, was mentioned. Mr. A. J. Walter, K.C., and Mr. Disturnal appeared for the plaintiffs, and Mr. Gore Brown, K.C., and Mr. Chater, for the defendants. Mr. Walter informed his Lordship that he would not be troubled with this case, which was an action with regard to certain letters patent which Mr. Gore Brown's client was claiming. An agreement had been come to by which the plaintiff obtained licenses under the letters patent set out in the claim. Mr. Gore Brown agreed, and the case was withdrawn.

Lancashire M.C.C. Hill-climb.

The results on formula $\frac{GT}{W}$ are as follows : Class B, single-cylinder bicycles.—No. 8, J. Woodcock (3½ h.p. Triumph). Figure of merit, 51.20. Class C, twin-cylinder bicycles.—No. 19, H. Haworth (5 h.p. Vindec Special). F.M. 62.91. Passenger class, J. W. Higson (3½ h.p. Triumph and sidecar). F.M. 55.25. The winner on general classification is J. Woodcock.

Competitors in the Barnsley Hill-climbing Competition at Stainboro' Park, which was spoiled by the wretchedness of the weather.
The winners were — Ledger (2¼ h.p. J.A.P.) and — Slater (3½ h.p. Triumph).

Essex Motor Club's Open Hill-climb.

THE above competition was held last Saturday at Lippitt's Hill, High Beech. The hill, although short, is a good test for the engines, and a considerable amount of skill is required to take the bend at high speed. The surface after the recent rains was in good condition, and fast times were made.

A new and novel arrangement of handicapping was instituted by Mr. A. G. Reynolds, by which it was sought to equalise the great variety of existing types of engines by placing them in various classes, viz., single-cylinder in three classes, engines not exceeding 80, 85, and 90 mm. in bore respectively, total weight of machine and rider to be not less than 320 lbs., and twin-cylinders in three classes, engines not exceeding 76, 80, and 85 mm. each cylinder, total weight of machine and rider to be not less than 340 lbs. It was very amusing to see the various ways and means competitors had used to bring their machines up to weight—sheet lead, lead water pipes, sash weights, and one rider was seen with a 7 lb. weight tied on his back.

Only one run up the hill was allowed, and the time made was credited to each class entered. It was a creditable attempt to arrive at a decision without waiting for formulæ calculations, but it caused a little dissatisfaction among competitors who had entered in more than one class with the same machine, as it did not give them an opportunity to improve on their times; however, a second attempt was impossible.

Scales were provided at the foot of the hill for the use of competitors to verify their weight, the official weighing taking place immediately each rider had completed the ascent. This ensured the total weight being carried.

The officials were: V. Hart, judge; E. R. Russell and W. H. Bishop, marshals; G. Pluck, starter; E. J. Bass, trials hon. sec.; Ebblewhite and Dutton, timekeepers.

The times were taken from a flying start, and the figures given represent zero as fastest time:

LIGHTWEIGHT CLASS.—Total weight not less than 250 lbs.

1. G. L. Fletcher (2 h.p. Moto-Rêve) ... 0
2. R. M. White (1½ h.p. Hazel) ... ... 1⅘s.

R. J. Bell (Moto-Rêve) and W. Smith (Motosacoche) dismounted.

CLASS I.—Single cylinders not exceeding 82 mm. Total weight not less than 320 lbs.

1. R. M. Brice (3½ h.p. Brown) 0
2. E. Varney (2¾ h.p. Givaudan) ... ... 1⅘s.
3. L. W. Bellenger (3½ h.p. L.M.C.) ... 3s.
4. W. A. Jacobs (3½ h.p. Rex) ... ... 4⅖s.
5. R. G. Dendy (3½ h.p. Brown) ... ... 8⅗s.
6. A. P. Howard (3½ h.p. Triumph) ... 9s.
7. P. Weatherilt (3½ h.p. Zenith) ... ... 31⅘s.
8. F. W. Barnes (3½ h.p. Zenith) ... ... 33⅘s.

CLASS II.—Single cylinders not exceeding 85 mm. Total weight not less than 320 lbs.

1. C. B. Heaton (4½ h.p. Noble) 0
2. R. M. Brice (3½ h.p. Brown) ... ... 4s.
3. G. Gibson (3½ h.p. Triumph) ... ... 6⅗s.
4. W. A. Jacobs (3½ h.p. Rex) ... ... 8⅗s.

It was a "day out" for Brown and Rex Motor Cycles at the Essex M.C. Lippitt's Hill-climb.
(1) R. M. Brice (3½ h.p. Brown) nearing the summit. (2) O. C. Godfrey (5 h.p. Rex) crossing the finishing tape.

CLASS III.—Single cylinders not exceeding 90 mm. Total weight not less than 320 lbs.

1. R. M. Brice (3½ h.p. Brown) 0
2. W. A. Jacobs (3½ h.p. Rex) ... ... 9⅗s.

CLASS I.—Twin cylinders not exceeding 76 mm. bore each cylinder. Total weight not less than 340 lbs.

1. F. W. Applebee (5 h.p. Rex) 0
2. C. R. Collier (6 h.p. Matchless) ... ... 1⅕s.
3. F. Applebee, jun. (5 h.p. Rex) ... ... 2⅖s.
4. O. C. Godfrey (5 h.p. Rex) ... ... 3s.
5. T. H. Tessier (6 h.p. Bat) ... ... 4s.
6. W. H. Wells (5 h.p. Vindec) ... ... 5⅕s.
7. F. White (5 h.p. Rex) ... ... 6s.
8. A. G. Reynolds (5 h.p. Vindec) ... ... 6⅖s.
9. O. L. Summers (5 h.p. Vindec) ... ... 9⅕s.
10. W. Pershke (5 h.p. Diamond) ... ... 11s.

CLASS II.—Twin cylinders not exceeding 80 mm. bore each cylinder. Total weight not less than 340 lbs.

1. F. W. Applebee (5 h.p. Rex) 0
2. F. Applebee, jun. (5 h.p. Rex) ... ... 2⅖s.
3. O. C. Godfrey (5 h.p. Rex) ... ... 3s.
4. W. H. Wells (5 h.p. Vindec) ... ... 5⅕s.
†. F. White (5 h.p. Rex) ... ... 6s.
†. E. J. Bass (7 h.p. Peugeot) ... ... 6s.
7. A. G. Reynolds (5 h.p. Vindec) ... ... 6⅖s.
8. W. Pershke (5 h.p. Diamond) ... ... 11s.

† Tied.

CLASS III.—Twin cylinders not exceeding 85 mm. bore each cylinder. Total weight not less than 340 lbs.

This gives the same result as Class II., with the exception that A. G. Reynolds did not enter for this class.

sex Motor Club's Open Hill-climb.—

MEMBERS' EVENT.—Single cylinders.

1.	E. Varney (2¾ h.p. Givaudan)	0
2.	R. G. Dendy (3½ h.p. Brown)	6⅘s.
3.	A. P. Howard (3½ h.p. Triumph)	7⅕s.
4.	W. S. Fruish (3½ h.p. Progress)	19⅛s.

MEMBERS' EVENT.—Twin cylinders.

1.	A. G. Reynolds (5 h.p. Vindec)	0
2.	O. L. Summers (5 h.p. Vindec)	2⅘s.
3.	Miss Blythe (3½ h.p. Diamond)	14⅗s.
4.	B. R. Billings (5 h.p. Peugeot)	20s.

HANDICAP.—Passenger motor cycles.

1.	R. M. White (5 h.p. Brown)	Scratch
2.	A. P. Howard (9 h.p. Singer)	10s.
3.	F. Cozens (10 h.p. Lagonda)	15s.
4.	F. Pershke (5 h.p. Chater Lea)	30s.
5.	Phœnix Motors (6 h.p. Phœnix)	20s.
6.	Zenith (6 h.p. Zenith)	Scratch

On Saturday next an inter-club team competition with ne West Essex A.C. has been arranged (see page 408). The cripples' outing has been fixed for June 27th, and the committee will be glad if those members who own passenger vehicles will lend them for that day. Those who are willing to assist in this matter should communicate with the secretary, Mr. Harold Fuller, Wivenhoe, Wynndale Road, South Woodford.

A.C.U. SUTTON BANK HILL-CLIMB. Alterations to the Rules.

A contour of Sutton Bank and particulars of the competition to be held on May 30th were published on page 377 last week. Some alterations have since been made to the conditions as follows: (1.) The maximum weight for the machines has been abandoned, except in the light-weight class. (2.) The limit in Class II. has been extended from 80 mm. to 82 mm. (3.) There is some alteration in the entry fees, viz.: For entrants connected with the trade, £1 1s.; for each additional entry in any other than the original class, 10s. 6d. For private members of the A.C.U. and members of affiliated clubs (private owners), 7s. 6d.; for each additional entry in any other than the original class, 3s. 6d. Others (private owners), 10s. 6d.; for each additional entry in any other than the original class, 5s.

Scene at the foot of Lippitt's Hill, High Beech, before the start of the competition on Saturday. The entries numbered forty-six.

Motor Cycle Racing at the Franco-British Exhibition.

THE first motor cycle race held on the new track in the Shepherd's Bush Stadium took place on the occasion of the opening of the Franco-British Exhibition by His Royal Highness the Prince of Wales on Thursday last, e 14th inst. The motor cycle event formed part of the orts programme organised by the Finchley Harriers, and, as usual when bicycle and motor bicycle races are run together, e latter were kept till the very end of the meeting, when ore than half of the spectators had left.

The entries were ten in number, and their fewness may be counted for by the fact that no one could even see the ack prior to the event. This doubtless accounted for the sence of many of the well-known racing men, who were turally averse to competing on a track which they had ver tried.

As regards the track itself, a few words may be of interest. ie curves are more acute than at Canning Town, and the ack itself lacks width; consequently it is not highly suitable motor cycle racing machines, and it is a thousand pities was not made so. For touring machines, however, it serves purpose. According to a competitor, it is safe for about y miles an hour.

The motor cycle event was a handicap, and in Heat 1 the lowing competitors started: E. McPherson (4 h.p. Brookds, J.A.P. engine, 85×85 mm.), scratch; F. W. Applebee h.p. Rex, 82×89 mm.), 200 yards start; G. Aldington h.p. twin Kerry), 200 yards start. Some delay ensued, er the time had at last arrived for the motor cycles to take their positions, as no one knew where the track was rked off. All through the afternoon it poured with rain, d at the moment of starting the motor cycle races it rained rder than ever, the only consolation being that the track was too wet to be slippery. Applebee made a good start, but Aldington was soon in trouble. Owing to the wet his magneto short-circuited and put the back cylinder out of action, while at times Applebee's Rex misfired badly. Owing to only two men being left in the heat, four laps were omitted, and the race brought to a speedy conclusion. Result: Applebee 1, McPherson 2. Time, 6m. 5⅕s.

The following competitors took part in the second heat: G. H. Gerhard (4½ h.p. Brooklands, J.A.P. engine, 85×95 mm.), 100 yards start; H. A. Cooper (3½ h.p. Triumph, 84×86 mm.), 120 yards start; A. E. Dendy (3 h.p. Centaur, 80×80 mm.), 200 yards start. Gerhard went ahead and maintained a good lead, finishing in the first place, while Cooper was second and Dendy third. Time, 7m. 59⅕s.

In the final, Applebee kept his lead for about two laps, when Cooper overtook him, and some excitement was occasioned. Applebee made a good fight and rode extremely well. Immediately, however, after Cooper had passed, the top of the cylinder and combustion chamber of Applebee's machine blew off, causing his withdrawal. Cooper finished first, Gerhard being second, and McPherson third. Time, 7m. 36⅗s.

Applebee's mishap was probably due to an old crack, as the metal at the fracture was rusted for the greater part of its extent. The whole of the cylinder head and combustion chamber, with the sparking plug, was blown off, and hung down by the high-tension wire. The rider was in no way injured.

The above races were open to touring motor bicycles, having a bore and stroke not exceeding 90×90 mm, and a gear not higher than 4 to 1. Mr. F. Straight was the handicapper, and members of the A.C.U. committee the officials.

CLUB NEWS.

Norwood and District M.C.

A new club was formed for the Norwood district at a meeting held on Wednesday evening last. The hon. secretary is Mr. W. H. Wilson, 2, Wolfington Road, Norwood.

Richmond and District M.C.C.

The next run will be to Petworth on Saturday, May 23rd, for the week end, when a hill-climb will take place. Gold and silver medals are offered as prizes. Entries close to-morrow, and should be sent to H. C. King, Walton House, Surbiton Road, Kingston-on-Thames.

Halifax and District M.C.C.

At a meeting held on the 14th inst. it was decided to form a motor cycling club for Halifax and district, with an annual subscription of 5s. All local motor cyclists are heartily invited to join, and the secretary, H. D. Helliwell, 7, Harrison Road, Halifax, will be pleased to hear from them.

Hull and East Riding A.C.C.

A speed-judging contest was held on Thursday last on the Hedon Road, Hull, and proved a very enjoyable competition. After this was run off the members proceeded to Withernsea. The following were the prize winners: 1, R. Pearson (3½ h.p. Minerva), 16 miles, 14.94; 2, Colour-Sergt. Evans (5 h.p. Vindec Special), 19 miles, 19.25; 3, A. Willis (5½ h.p. Rex), 15½ miles, 14.94.

Meeting of Nottingham Motor Cyclists.

A meeting will be held at the Lion Hotel, Clumber Street, Nottingham, at 8.30 sharp on Monday next, May 25th, when all local motor bicyclists, tricarists, and small car owners are cordially invited to attend. Mr. F. Straight (secretary Auto Cycle Union) will be present to discuss matters. Those who cannot attend are requested to write Mr. E. G. Young, Trent Bridge, Nottingham, their opinions.

Glasgow M.C.C.

The open hill-climbing contest on Peesweep Hill, Paisley, on Saturday last, took place under most disagreeable weather conditions. There were twenty-six starters, divided into three classes: Class 1, single-cylinders, not exceeding 80 × 80 mm.; Class 2, single-cylinders exceeding 80 × 80 mm.; Class 3, multi-cylinders. The results on the formula will appear in our next issue.

The fastest times in each class were: Class 1, Jas. Roberts (3½ h.p. N.S.U.); Class 2, A. G. Bostock (3½ h.p. Triumph); Class 3, D. G. Bostock (6 h.p. N.S.U.).

West Essex A.C.

The result of the eighty miles competition for the Gamage cup is as follows: Non-stops, R. E. Denby (3½ h.p. Brown), W. E. Gunnett (3½ h.p. Triumph), W. M. Gunnett (3 h.p. Triumph), V. Baldwin (3½ h.p. Brown), and G. W. Glenny (8-10 h.p. Darracq car). The final, in order to find the winner, will be run off in June, and will take the form of a speed-judging competition.

The inter-club contest with the Essex M.C. is on Saturday next, and the course will be a circular one, from the Castle, Woodford, by Sewardstone, Waltham, Epping, Ongar, Chigwell, back to Woodford. The circuit, covered twice, totals seventy to eighty miles. This will enable spectators to view the riders at various points. Start 3 p.m.

Manchester M.C.

This club held its fifth annual hill-climb for motor cycles on Saturday last. The hill selected was a very stiff gradient on the borders of Derbyshire and Cheshire. Thirty-nine entries were received, and nearly all started. The following results are announced, although subject to scrutiny:

Results on handicap.—1, W. Andrews (3½ h.p. Jap), Humber vase and gold medal; 2, W. Heaton (3½ h.p. Rex), silver medal and gold medal for single-cylinder non-trade member; 3 A. H. Albert (3½ h.p. Quadrant), bronze medal.

The hon. sec., A. J. Moorhouse, riding a 5 h.p. Twin Rex, made the fastest time of the day, gaining the gold medal for the non-trade twin-cylinder class, and the gold medal for the first twin-cylinder machine on handicap. The tricar gold medal was won by E. Rees on a Dragon runabout. The winner (Andrews) secures the Humber vase for his own property, as he won a half share in the same at the 1904 hill-climb. The other winners of 1905-6-7—Percy Butler (3½ h.p. Triumph), A. V. Baxter (5 h.p. Vindec), and J. Marshall (3½ h.p. T.T. Triumph) respectively—competed, but were unsuccessful, they being outside the prizes.

North-west London M.C.C.

Between twenty and thirty starters are expected for the twelve hours London to Coventry and back trial next Saturday. It has been decided to enter a team for *The Motor Cycle* challenge cup.

Swansea and District M.C.C.

A meeting will be held at the Grosvenor Hotel, Swansea, on Tuesday, the 26th inst., at 8 p.m., to consider the advisability of forming a motor cycling club. Further particulars may be obtained from W. S. Griffiths, 2, Mackworth Terrace, Swansea.

Great Yarmouth and District M.C.C.

The club penalty run was held on Thursday last over a course of seventy-six miles; two circuits of thirty-two miles and one of twelve, starting from Haddisoe Church. The starters were fifteen out of twenty entrants. The following made non-stop runs: Dr. Mayo, Moto-Rêve, time 3h. 59m.; Mr. Galley, 2¾ h.p. Anglian, 3h. 59m.; Mr. Hallinstein, 3½ h.p. Wanderer, 4h.; Mr. Watts, 3¼ h.p. Singer, 4h.; Mr. North, 4 h.p. Roc, 3h. 58m.; Mr. Smith, 3½ h.p. Peugeot, 3h. 44m.

Perth and District M.C.C.

A consumption trial was held on Saturday round the Rhynd circuit, starting at Bridge of Earn. There were twelve starters. The competitors were given petrol on the formula $\frac{W + C}{25} = P$, and had to run their machines round the circuit till the engines stopped, the distance being then noted. The first three in order of merit were as follows: 1, C. Livingstone (3½ h.p. Rex), 34.5 ozs. allowance, 31¼ miles, 145 approximate miles per gallon; 2, J. W. Robertson (3½ h.p. Rex), 33 ozs., 30 miles, 145; D. Bachelor (3½ h.p. Rex), 33 ozs., 29 miles, 141½. Pedalling was permitted, and was fully taken advantage of by one or two competitors.

Bradford M.C.C.

A hill-climbing contest was decided at Greenhough Hill, Pateley Bridge. Unfortunately, the start was somewhat delayed by lack of arrangements with the police, but eventually a start was made at 3 p.m., but by then many members had retired, believing the contest to have been abandoned. The result was as follows:

1. Eric Myers (3½ h.p. Triumph) ... ... 60⅖s.
2. J. Scriven (5 h.p. Rex) ... ... 68⅖s.
3. F. Gerhartz (5 h.p. Vindec Special) ... 72s.

A speed-judging competition was held on the 17th inst., the trophy competed for being a pair of bronzes presented by Mr. Barraclough. The course was five miles in length, and the speed fixed at 15 m.p.h. The winner proved to be Felix Scriven (5 h.p. Rex), who completed the distance in 20m. 30s., being 30s. within schedule time.

Leeds M.C.C.

The official results of the hill-climb at Beulah Hill are:

	Single-cylinder Class.	Figure of merit.
1.	E. S. Myers (3½ h.p. Triumph)	14.6
2.	— Slater (3½ h.p. Triumph)	12.9
3.	F. W. Greenwood (3½ h.p. Rex)	11.9
	Twin-cylinder Class.	
1.	A. B. Hughes (4 h.p. N.S.U.)	12.8
2.	H. A. Hughes (5½ h.p. N.S.U.)	11.2
3.	Geo. Tennant (5 h.p. Vindec)	10.9

The final was run off by handicap representing the difference in time between the winner of each class, and resulted as follows: 1, A. B. Hughes; 2, E. S. Myers.

Fastest times: E. S. Myers for single class; Owen Brooks, twin class.

Awards: Kirk Trophy and gold medal, A. B. Hughes; silver medal, E. S. Myers; bronze medals, H. A. Hughes and — Slater; certificates for fastest time, E. S. Myers and Owen Brooks.

Cambridgeshire M.C.C.

The following are the results on the A.C.U. formula of the hill-climb held on the 7th inst. at Croydon, to select a team of seven to compete against the Cambridge University Motor Cycle Club to-morrow (Thursday):

1, W. King (2¾ h.p. King); 2, H. H. Harper (2¾ h.p. King); 3, C. W. Wilson (2¾ h.p. King); 4, F. T. Cox (2¾ h.p. King); 5, F. Pryor (2¼ h.p. Humber, two-speed); 6, A. J. Mihill (2¾ h.p. King); 7, B. L. Peters (3½ h.p. Minerva). Messrs. Golder and Sturton are reserves.

Club News.—

Leeds M.C.C.

The run on the 23rd inst. is to Pocklington to meet the Hull A.C.C., and on the 31st inst. to Croft Spa, meeting at the Angel, Wetherby, 10.30 a.m.

Worcestershire M.C.C.

On the 24th inst. the run is to Bridgnorth, and on the 30th inst. to Stourport; tea at Three Tuns. There will be a short evening run from headquarters at 6.30 every Thursday.

Burton-on-Trent and District M.C.C.

The above club will hold a run to Market Drayton on Whit Monday, at the kind invitation of a member. A reliability trial as far as Stafford will be incorporated in the run, the minimum time for the twenty-five miles being 1h. 20m. and the maximum 1h. 30m.

Coventry M.C.

The committee of the above club are extremely anxious to arrange for two checkers at Holyhead for the members' reliability run on May 30th. If this should catch the eye of any willing helper in Holyhead, will he kindly communicate with the hon. secretary, E. W. Walford, 19, Hertford Street, Coventry?

Edinburgh M.C.C.

An open hill-climb was held on the 9th inst., when twenty-eight entries were received. There were four classes, singles, twins, tricars, and also a class for unlimited engines which was scratch. — Mowat (3½ h.p. Griffon) won the single-cylinder class; C. H. Macmillan won the twin class on a F.N.; and Baxter, on a 5½ h.p. Rex, won the scratch class. Baxter also made fastest time in the twin class. In the unlimited class R. Macmillan, on a 3½ h.p. Ormonde, made second fastest time. There was a large turn-out of motor cyclists, and fully 400 interested spectators.

Southend and District M.C.

At the extraordinary general meeting, a rule was passed admitting country members residing outside a radius of ten miles from the club's headquarters at Southend-on-Sea at half subscriptions.

Arrangements have now been completed with the committee of the flower show annually held at Great Stambridge for the promotion by this club of a gymkhana on Wednesday, July 22nd, on the occasion of the flower show. The Show Committee are contributing a substantial sum of money towards the prizes to be offered.

Lincolnshire M.C.C.

Two routes have been decided upon for the great reliability trial on Whit Monday. The South is by way of Grantham, Stamford, Spalding, Holbeach, Boston, and Lincoln. The North goes by way of Horncastle from Lincoln to Spilsby, up to Grimsby, through Brigg to Scunthorpe, down to Gainsborough, and home to Lincoln. Both are equally difficult, and the distance is 125 miles. Every member making a non-stop run has a medal, and the silver cup goes to the rider keeping nearest to his schedule.

Mr. W. J. Clarke, Louth, who rode a twin Rex in the hill-climb at Waddington, has been adjudged to have made by far the best performance of the day, and he, therefore, takes the handsome silver valse presented by Mr. R. M. Wright Lincoln.

Newcastle Motor Club.

Two important fixtures have been decided upon: June 8th (Whit Monday), 114 miles non-stop, from Newcastle to Jedburgh and back, for Robson shield; June 25th, reliability trial, for Lucas bowl, from Newcastle to Edinburgh and back.

Brighton Cyclists' Club (Motor Section).

A fair number of members turned out for the run to Billingshurst on May 10th, and a very enjoyable day was spent, some fourteen members sitting down to dinner at the King's Arms. The next run takes place on May 31st, to Hurstmonceux.

Surrey M.C.C.

This club has now enrolled its fortieth member, but the officials are anxious to make the club one of the strongest and most influential in the country. The club is affiliated to the Auto Cycle Union, and has arranged an extensive programme. Unattached riders are asked to communicate with the hon. sec., E. H. Russell, 7, Haydon Place, Guildford.

A competitor in the Motor Cycle Union of Ireland (Ulster Centre) Hill-climb at Carnmoney (see page 388 last week).

"The Autocar Directory," which has just been published, fills a long-felt want. We are constantly being asked for addresses of firms in the motor cycle and motor car trades, and in many instances the enquirer merely knows the name of some proprietary article, but does not know the address of the maker or agent. "The Autocar Directory" is a classified directory of the motor industry, *i.e.*, makers of accumulators will be found under that heading, but if they should in addition make induction coils, their names will again be found under "Coils," and so on. There is a list of "named" motor bicycles, tricars and sidecars, motor cars, industrial vehicles, accessories, clothing, etc.; also an alphabetical list of names and addresses, with telegraphic addresses, telephone numbers, etc. The price is sixpence, and it can be obtained from Iliffe & Sons Ltd., 20, Tudor Street, E.C.

The first meeting of the newly-formed Cambridgeshire Motor Cycle Club. Seven picked members of this club will compete against a like number of Cambridge University motor cyclists to-morrow in a hill-climb.

LETTERS TO THE EDITOR.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Twin-cylinder Puzzles.

[3312.]—Referring to "Another Twin-cylinder Puzzle" mentioned by "Ixion" in *The Motor Cycle* of April 29th, I had exactly the same trouble with my 5½ h.p. single-cylinder Rexette. It was due to excessive wear in the butterfly throttle, which was able to rock about independently of the lever. The result of this was that the engine would only run when the lever was more than half advanced, and could not be controlled at all by the throttle.

R. O. SEVILLE.

The Motor Cyclists' Ideal.

[3313.]—In your issue for May 6th, "Nirvana" [letter 3296] has, I think, specified about my ideal motor cycle. I should lay stress upon large tyres, and should like to find something really satisfactory in the way of keeping the rider clean in muddy weather without interfering with the cooling of the engine. I imagine that a fan would be a necessity for riding in traffic, and I should like to get a more direct drive than the F.N. has, doing away with the gearing in the bottom bracket if possible. This would make the machine really silent. I have had a four-cylinder F.N. for over a year, and would not think of having less than four cylinders, other than upon a lightweight.

A. DUKINFIELD JONES.

The Scandal of Motor Cycle Tyres.

[3314.]—We have noticed in your issue of May 6th the wholesale condemnation of tyre manufacturers by Mr. W. E. Holmes. We think if Mr. Holmes could see a sample of our Modèle de Course cover, which we specially brought out several years ago to meet the requirements of motor cyclists who want a tyre of extra heavy make, we should be in a position to convince him that there is a firm who can produce an article which would meet his requirements.

THE CONTINENTAL TYRE AND RUBBER CO.

[3315.]—I think Mr. Holmes [letter 3299] is perhaps a little too sweeping in his indictment of the tyre manufacturers, but there is no doubt that there are unsatisfactory tyres on the market. After several expensive and unsatisfactory experiments with other makes I tried the Palmer cord tyre, and from that day my troubles ended. Last season I ran one of these tyres on the back wheel of a 3 h.p. machine a distance of 3,744 miles with only one or two nail punctures, and when I sold out in the winter, except that the corrugations on the tread had almost disappeared, the cover was as good as when new.

ES 224.

[3316.]—I feel it would be unfair to allow Mr. W. E. Holmes's letter on the above subject to pass without comment. There are, of course, as you say in your footnote, "tyres and tyres," and for my part I have no reason to complain. I daresay, were statistics taken, I should be found to be one of the most prodigious riders in the country, living as I do in the saddle from morn to eve six days of the week, and seldom covering less than one hundred miles between 9 a.m. and 6 p.m. I have, since the beginning of March, covered over 4,000 miles on my 3½ h.p. Triumph without a single puncture, until a recent Saturday, when through negligence I allowed a stone cut to cause a burst. Now, I hold no brief for any make of tyres, but being a heavy rider require something reliable. My back tyre is a Clincher A Won, fitted with Grose non-skid; the front a Clincher A Won by itself.

W. L. PALMER.

Lightweights in the End-to-end.

[3317.]—With reference to letter No. 3290, signed R. J Getting, it is evident from what he says that he is more conversant with the route than "W.W.D.," and it will undoubtedly be an extremely severe test for lightweigh machines. We look forward, as he does, to a large entry o lightweight machines, and as far as the Moto-Rêves are concerned they would not dream of being absent!

THE MOTO-REVE CO.

Gudgeon Pin Accidents

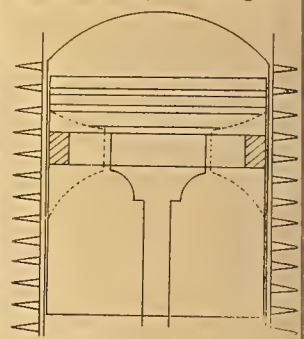
[3318.]—Your correspondent. Mr. J. Hayton, goes ou of his way to ridicule an experience related some time ag by Mr. B. H. Davies, who had an exhaust valve head stuc sidewise in the top of his piston, like a penny in a cheese Mr. Hayton evidently belongs to that small class of you readers who invariably attack anything that Mr. Davie writes, insinuating either that the latter does not tell th truth or does not know what he is writing about.

I should like to inform Mr. Hayton, if he will believe me that a precisely similar incident happened to myself, ridin the same make of machine as Mr. Davies. The valve broke o at the top when the engine was running fast, with th result that the valve head rolled on to the top of the pisto and was caught and jammed sidewise in it. As I had to pa a considerable sum for a new piston, I am not likely to forge the occurrence.

I may add that Mr. Davies was particularly kind i answering an enquiry I addressed to him as to a small devic he had invented to prevent a recurrence of such an accident I may also add that, in my opinion at any rate, there is n feature of your excellent paper which is more enjoyable tha an article by Mr. Davies, whose very long practical experienc is worth a good deal more than the theories of some of you correspondents.

W. MERRITT.

[3319.]—In common with several of your correspondents I was once a sufferer through gudgeon set-pins falling out but since fitting the small device as seen in the sketch I have no need for these little worries. It was fitted for me by Mr. Felton, a local repairer, but can easily be done by any mechanic. About ⅛in. or ¼in. is sawn off each end of the gudgeon pin, and a circular piece of brass of the same diameter is placed at each end, long enough to touch the cylinder at either side. It will be seen that this prevents any side play of the gudgeon, and thus does away with any need for set-screws. The brasses show no signs of wear, and apparently have no effect on th cylinder walls.



ILFORDIAN.

Courtesy at the Shows.

[3320.]—I hope you will grant me space to remove the stigma placed upon Liverpool business men by the error in my letter in your issue of last week.

When mentioning the instance of lack of courtesy shown at the latest motor show in Town, I meant London. It was far from my intention to cast any reflection on the acknowledged keenness and hard-headedness of the Northerner.

R. S. BROOKE-HITCHING.

Luggage Carriers.

[3321.]—"There is nothing new under the sun." The luggage carrier illustrated in the issue of April 22nd—3265—was the subject of a patent—No. 21,313, 1901, "An Improved Luggage Carrier for Cycles"—taken out by our Mr. Stewart and Mr. J. Riley, of Manchester, years ago. The idea was allowed to lapse, as after submitting it to Messrs. H. G. Turner, the pioneers of cyclists' carriers, and Messrs. Joseph Lucas, Ltd., who refused to purchase, only a very small sale resulted. It is, of course, public property, and we have fitted dozens to motor and pedal cycles during the last seven years. We will not bore your readers with the specification, but the last item of claim runs as follows: "In the case of extended seat-pillars the appliance may be clipped to either of the tubes forming such seat-pillars."

THE MANCHESTER AUTO CYCLE CO., LTD.

Sidecar Tyres.

[3322.]—The letter in the issue of May 6th from Mr. J. F. Pooley respecting the wearing of sidecar tyres is an interesting addition to the fixed *v.* flexible sidecar controversy.

My experience (about 3,000 miles with a Liberty fixed or rigid sidecar) shows that this pattern car is not heavy on tyres. The tyre bought with sidecar was a Liberty Duraflex, and was used without consideration, taking the roads as they came, in Warwickshire, Somerset, Gloucester, Devon, Cornwall, and Wales. The one tyre stood the 3,000 miles, and the tread was good then for a similar number apparently, but it was spoilt in another way. Early in the season I fitted some chain nailcatchers, and fitted them so badly that the clips ploughed a groove in the sidecar tyre through to the canvas. The tyre stood about 2,000 miles after this misuse, until the heavy wet weather came, in October, when bursts became the order of the day, and I had for the first time cause to inspect my sidecar inner tube.

I may say that I never experienced any strain on the cycle frame, or difficulty in steering, or riding "solus."

HENRY W. WARRE.

The Balancing of Petrol Engines.

[3323.]—I am glad to see that my letter *re* the balancing of petrol engines has led to some very interesting correspondence. I should, however, like to point out to your various correspondents that I am not complaining because the engine makers do not produce an impossibility, viz., a perfectly balanced engine. In the case of the Kerry and Quadrant engines I mentioned, the alteration to the flywheels did undoubtedly lead to far less vibration and improved running, which seems to prove that the engine makers do not turn out their engines anything like so well balanced as they could do if they chose to take the trouble.

3187 mentions that after altering his engine he found excessive vibration in the front fork, which eventually fractured, but who is to prove that his forkcrown broke because he altered his engine? It is surely quite reasonable to assume that the fork was faulty, and would have broken sooner or later in any case.

In reply to 3226, my Triumph runs very satisfactorily at all reasonable speeds, which I believe is partly due to rather low compression as compared with some engines, but I still think that there could be a further improvement.

The Rex Co. are the only makers who have come forward to say a word for themselves, and in fairness to them perhaps I should have said, "Why do some of our best engine makers," etc. As to vibration on the twin Rex, I cannot say, never having ridden one. SHAZBAZZIK.

Sidecars and Single Gears.

[3324.]—I feel I cannot let "Ixion's" remarks in a recent issue pass without a protest, as I think they give quite a wrong impression, and that they will frighten owners of single-geared machines from getting sidecars, by which they will lose a very great amount of pleasure. The same applies to your remark in the "Questions and Replies" column, viz., "For serious touring a change gear is indispensable." I have ridden many hundreds of miles with a single-geared 3½ h.p. Quadrant and old pattern Liberty sidecar with Montgomery compensating joints attached, so that I do not speak without any experience. To take one instance. Last summer I one day rode from Cardiff to West Kirby (near Birkenhead), 170 miles, in just under the twelve hours with an 8½ stone passenger, and, although I used a gear of 4⅔ to 1, I only had to pedal a few light strokes on two hills, and that was because the belt slipped badly. The stops—for meals and a burst tyre—amounted to nearly four hours. I know, of course, that there were no very bad hills on this route, but it is very seldom that a really bad hill cannot be avoided, and when one is touring for pleasure, what does a detour of even as much as twenty miles matter? Even if a hill steeper than 1 in 10 cannot be avoided, surely it is not a very serious matter for the passenger to have a little walk while the sidecar is run up empty, though I have never even had to do that since I got my 3½ h.p. machine, except when through some cause the engine was running badly.

For the benefit of Quadrant riders I might here state that I find that my 3½ h.p., geared 5 to 1, with sidecar and 8½ st. passenger, is just about the same as far as hills are concerned as my old 3 h.p. surface Quadrant used to be with normal gear, solus (except perhaps in the teeth of a terrific head wind), and there were not many hills that they would not romp up. Even with that little machine I had a great deal of pleasure with the same sidecar. I remember once riding from West Kirby to Dolgelly quite comfortably between breakfast and lunch (eighty miles in four and a half hours with several stops), and there are some long stiff pulls on that run. Even with that machine I could get up almost anything with the sidecar empty. For instance, I once had to go from Bettws-y-Coed to Blaenau Festiniog (Contour Road Book, Route 1018), and it was amazing the way the little machine tore up the mountain from Roman Bridge with the empty sidecar. My present mount, with sidecar, geared 5 to 1, will do thirty miles an hour on the level, and will simply romp up anything under 1 in 11 with passenger.

Old and new methods of locomotion in the heart of India. The photograph was taken at Raipur, nearly half-way between Bombay and Calcutta.

I have fitted a larger belt rim than the one fitted by the makers so that I can get my low gear with a bigger diameter engine pulley, and this has eliminated all belt-slipping trouble. I can still get my normal gear of 4 to 1 when the belt is at the top of the adjustable pulley. My machine is the 1906 pattern, and is by no means above the average in power.

I think I have said enough to show that a two-speed gear is by no means a necessity for touring purposes (although it is undoubtedly a luxury), and that to put 5 h.p. as a minimum is absurd. As for "Ixion's friend, who still knows what it is to fail on a hill with empty sidecar with a 5 h.p. double geared twin, I can only imagine that his machine is only fit for the scrap heap, or that he has been trying to take the sidecar to the top of Snowdon, or something of that sort.

I have no doubt that "Ixion" will say that it is obvious that I have never been up a hill, and do not know what one is, but my point is this, for ordinary pleasure touring on average English roads a 3½ h.p. single-geared machine is all that is required if it is given attention and kept in good trim. If you want a combination that will go absolutely anywhere and climb steep mountain passes without dropping the passenger, then by all means get the most powerful machine that is made. C. G. K.

[If "C. G. K." had stated his weight, the above mentioned experiences would have been of more value.—ED.]

Luggage Carriers and Other Items.

[3325.]—I saw Messrs. Reed and Co.'s letter and photograph in the issue of April 22nd. I admit the similarity, but the preponderance of points of dissimilarity will go to show that I was unaware of the registration. I have not seen their carrier, but I should judge that, owing to its length, it was ill suited for lateral strains. I offer them my cross girder arrangement gratis.

Alluding now to letter No. 3268, I, too, am a possessor of a 5 h.p. twin (of well-known Continental make). I dismantled at 2,000 miles, and found everything in want of some attention or other. I rectified everything, and got more tune than I had had, but some readers may remember "Ixion" and my "twin-cylinder puzzle," how the front cylinder would not do its work.

I am writing now after a trial of the motor fresh from the hands of the makers, who have kept it some weeks, and charged me a fair price for what they have done. The motor has not been tested at all (the cleanliness of the valves, etc., proves this), and the cylinders are still as unsynchronised as ever they were. So that my twin has had all wearing parts replaced twice in 4,000 miles, and now is still unsatisfactory, although I think I can locate the fault. I am not "dissatisfied," but simply "disappointed."

I am looking out for the efficient two-speed gear, and then the popular 3½ h.p. single will gain one more supporter in the person of B. RICHARDSON BILLINGS.

Air Cooling.

[3326.]—We have read a lot lately about the question of overheating of air-cooled engines, but to me the principal question seems to have been overlooked. The whole problem as I look at it is, "Are air-cooled engines efficient?" and although I expect there are a good many who will be ready to contradict me I venture to say they are not.

Having made such a statement I expect you will want me to justify it, and, although I may not state my case as concisely as some might desire, the whole thing to me appears to be quite clear. Without seeking to introduce the laws of any of the dear departed gentlemen who have been quoted by some whose letters you have printed, and which are not understood by very many readers, I will endeavour to show what I mean in as simple language as possible.

It is pretty generally known that all the engines at present fitted to motor cycles only develop their stated horse-power, whether it be 1¾, 3½, or 5 h.p., at an engine speed of about 2,000 revolutions per minute. And it is also common knowledge that that engine speed is very rarely attained on the road (or should be), and the reason is that the speed that would be attained by the machine would have passed the average limit of ordinary safety.

For instance, a motor cycle with a gear of four and a half to one and with 26in. wheels would travel 34.3 miles per hour, and with 28in. wheels 37 miles per hour. Now, as the average speed of a motor cycle on a long run would be somewhere about half these speeds, it is self-evident that for about ninety to ninety-five per cent. of its running time the engine is only turning at the speed of about 1,000 revolutions per minute, and at that speed it would only develop a little over one-half its rated power. That is to say, that only for from one-twentieth to one-tenth of its running time does a 3½ h.p. engine give off more than about 2 h.p.

I do not want the lightweight advocates to shout out that this is where the lightweight low-power machine shines, because they are in exactly the same condition, the same thing applying equally to different powers. This being the case, and the full power being required so seldom, the question arises, "How long would any of the engines at present running on the road give their actual rated horse-power at 2,000 revolutions per minute without becoming unduly (not over) heated if geared to travel at about seventeen miles per hour?" or, on the other hand, how long are they run on the test bench at 2,000 revolutions per minute? I know that test bench conditions do not prevail on the road.

Now, I contend that what we require is an engine that will develop its rated power for any length of time without artificial methods of cooling and without coming to a stop, as at the present time everything appears to me to point to the inefficiency of and inability of our present engines to cope with their task for any length of time when working up to their full rated power.

I am not in a position to suggest any remedy at present, but it appears to me that we are at present carrying an engine about twice as big as we require for the work to be done except for less than one-tenth of the running time, and then it is only a question of gear and speed for that one-tenth.

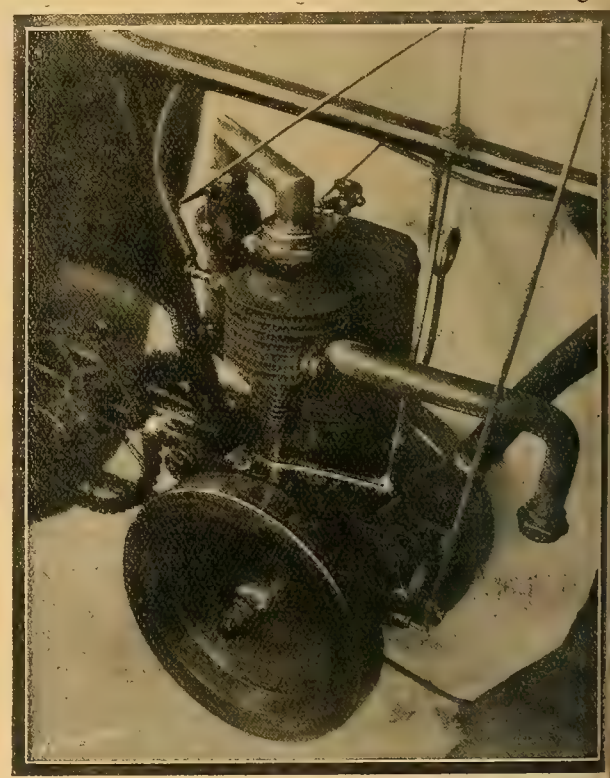
If I am wrong in what I have stated, kindly correct me, and also explain how an air-cooled engine under present conditions is efficient. SCOTIA.

Unattached Riders.

[3327.]—As a motor cyclist and constant reader of your paper, I beg to thank you for your persistent efforts in securing the council of the A.C.U. to admit unattached riders into their care. I thought of a 10s. subscription, same as the Motor Union, of which I am a member, but you have gone one better with 5s. I should now like to see the A.C.U. promote an insurance policy on the same lines as the M.U. I have not written your paper since the discussion began because I was heartily sick of it. I had already spoken to Messrs. F. Straight (the secretary), A. Sharp, and others on this matter, but they declined to entertain it. I will not waste your time further, but again thank you for your determination. J. M. BUTLER.

Outside Flywheels.

[3328.]—Having been a reader of your valuable paper for three years, I have read with interest the various topics contained therein. I am greatly interested in the discussion on outside flywheels, as my machine had one outside flywheel weighing 14½ lbs., which worked exceedingly well up to a speed of twenty-five miles per hour; over that speed I could feel the need of a much heavier wheel, so I decided to have



An engine with two outside flywheels referred to in the accompanying letter.

two outside flywheels fitted. I have done so, and I can assure your readers it has answered my expectations to the full. I fully endorse the remarks of Mr. A. J. Atkings, both in regard to power and balance, and he will see that there is at least one, although not a recognised maker, that has not only attempted, but has accomplished the fact. I should be pleased to give any of your readers further particulars.

JAMES TUNNICLIFFE.

[Several interesting letters are unavoidably held over.—ED.

MOTOR BICYCLES FOR SALE.

ANTOINE, 4 h.p., splendid condition; a bargain, £17 10s.—Below.

ALLDAYS Traveller, 5½ h.p., two speeds and reverse, splendid condition; £35.—Sanders, Spring Gardens, Buxton.

F.N., 1¾ h.p., new 1907, perfect condition; £25.—George Potter, Stamford.

MOTOR Cycle; £5; push bike part exchange.—663, Old Kent Road, S.E.

1908 1¾ h.p. F.N., new; £28, lowest.—G.S., 10, Mansfield Road, Hampstead, N.W.

ANGLIAN Motor Cycles with simplest and most practical two-speed gear.—Below.

DOUGLAS Twin Motor Cycles, the marvellous lightweight; also

SIDECARS (Mills-Fulford castor wheel), and a special selection of second-hand bicycles and tricars can be seen and tried at the London agents, H. P. Rose, Ltd., 28, Frith Street, Shaftesbury Avenue, W.

2½ h.p. Minerva, Eadie, Dunlops, spray; £10.—53, Grange Park Road, Thornton Heath.

TRIUMPH, 1908, 3½ h.p., magneto; £42.—James, 9, Hampton Street, Walworth, London.

1¾ h.p. Minerva, wants a little touching up; £3 10s.—139, Great College Street, Camden Town.

FOR Sale, Singer Motor Cycle, belt driven, as new; £28, no offers.—Dormer, Surveyor, Chesham.

WHIPPET Motor Cycle, 2¾ h.p. F.N., good condition; £9. — 40, Northborough Road, Norbury.

REX, 3¼ h.p., 1906, splendid condition; £13; after six.—Miller, 39, Hawkstone Road, Rotherhithe, S.E.

2 h.p. Clement-Garrard, in splendid going order, new tyres; £5.—S. Goldstraw, London Road, Derby.

MINERVA 2 h.p. Motor Cycle; any trial; price £8; no dealers.—Luce, 27, Chancery Lane, London.

5-6 h.p. Twin Rex, spring forks, guaranteed; only £18 10s.—Garaged, Hardy's, Carlton Street, Halifax.

2½ h.p. Brown, good running order, tyres (Dunlop) nearly new; £10.—28, Howard Road, Walthamstow.

QUADRANT, 3½ h.p., 1906, reliable, ready for the road, tyres nearly new; £20.—Penfold, Beaconsfield.

£5.—Quadrant, 1¾ h.p., spray, good running order; a bargain.—Goddard, Glensmore, Sutton Lane, Chiswick.

3½ h.p. Triumph, magneto, variable pulley, very little used; £31.—Scrase, 234, Battersea Park Road, S.W.

3½ h.p. Excelsior; £15; in good condition, Clincher tyres 26 by 2.—Logsdon, 6, Nelson Road, Whitstable.

1907 3½ h.p. Triumph, in excellent condition; £33, carriage paid. — N. Orr, School Lane Mill, Preston.

TRIUMPH Motor Bicycles, 3½ h.p., 1908 models, from stock; no premium.—Tom Norton, Llandrindod Wells.

4 h.p. Antoine, magneto, excellent condition, stand, horn, £18; Osborne four-speed. £3.—Rev. Cooper, Barnet.

IMMEDIATE Delivery, new 1908 Phelon and Moore, two-speed, Palmer tyres.—Potter, Agent, Blenheim Square, Leeds.

2¾ h.p. De Dion Engine Motor Cycle for sale through illness; £19 10s.—Green, Berry Villa, Great Barford, Beds.

TRIUMPH for sale, perfect; wanted, 1¾ h.p. Minerva cylinder. — Motor, Albany House, Lower Bristol Road, Bath.

2¾ h.p. Brown, everything in good condition, all accessories; trial given; £8 cash.—51, Richmond Road, Ilford.

FOR Sale, 2¾ h.p. Werner, 26in. wheels, good running order, £9; Fuller's charging set, £1; bargains.—Friskney, Baumber.

3½ h.p. Fafnir, Chater-Lea frame, Osborne speed pulley and free engine; £16.—Mason, 18, Albert Road, Stroud Green, N.

2¾ h.p. Beeston Humber, free engine, splendid condition, take two anywhere; bargain, £16 16s.—12, Claremont Hill, Shrewsbury.

BOOTH'S
HIGH-CLASS STOCK.

£6 and a 3¾ h.p. Rex or decent machine of other make secures a splendid 6 h.p. Twin Rex, low built.

£5 and your high built machine secures a low built 3½ h.p. Rex.

MOTOR BICYCLES FOR SALE.

BOWDEN, 2¾ h.p. F.N., vertical, spray, very low, chain, handle-bar control; £8 10s.—Freak, Hazeldene, Hillside Road, Watford.

2¾ h.p. Minerva, excellent condition, new Palmer cord back, B100; £14.—R.W., 3, Grosvenor Gardens, Willesden Green, N.W.

3 h.p. Quadrant, spring forks, £10; 3 h.p. Hobart, £10; 2 h.p. Quadrant, £8; 1¾ h.p. Minerva, £6.—Gibbon and Co., Aberavon.

BARGAIN.—3 h.p. Bradbury motor cycle and fittings, just overhauled; £15 10s.—Irving, 1, Frobisher Terrace, Altofts, Normanton.

PHŒNIX Cob, 3½ h.p., two speeds, magneto, climb anything, excellent condition; £35, or near offer.—Dr. Gervis, Seaford, Sussex.

4½ h.p. Twin Minerva, with Ariel coupler and Rudge lady's bicycle, in good order, new tyres; lot £25.—Dall, Barrow-in-Furness.

£18.—Four-cylinder Binks, fitted synchronised ignition, pan seat, free engine, chain drive, faultless. — Rowell, New Inn, Windsor.

1907 Quadrant, 3½ h.p., excellent condition; £30, or near offer; ride 50 miles Manchester.—No. 9,900, *The Motor Cycle* Offices, Coventry.

QUADRANT, 1907, 3½ h.p., Birmingham model, good hill-climber, as new; bargain, £20.—Guyver, Wood Street, Stratford-on-Avon.

2¼ h.p. De Dion Motor Cycle, tyres as new, with spares and lamp; £2 and push cycle, or sell £3.—121, Shooter's Hill Road, Blackheath.

GENUINE 4 h.p. Bat, absolutely as new, spring forks and frame, low, powerful and reliable; £20; any trial.—Marsh House, Leominster.

FOR Sale, lightweight motor cycle, N.S.U., last year's make, magneto ign. in running order. — Hodgson, photog. Cleckheaton.

2½ h.p. Kerry, in splendid condition and going order; not done 100 miles; £13; no time for riding.—C.H.W., 28, Upper Clapton Road, N.E.

2¾ h.p. Werner, M.O.V., spray carburetter, accumulator ignition, free engine, good condition; £8 10s.—Richardson, Stonebridge, Horbury.

LADY'S Motor Bicycle, Singer, 2½ h.p., spring pillar seat, splendid condition; £15, inclusive speedometer.—S., 21, Duke's Avenue, Muswell Hill.

TRIUMPH, 3½ h.p., 1907, standard, magneto, perfect condition, heavy tread on back tyre; price £33, or offers.—No. 9,438, *The Motor Cycle* Offices, Coventry.

3 h.p. M.M.C., Chater-Lea frame, Longuemare, Continental tyres, low built, almost new; £18 18s.—A. J. Slatter, 59, Cranfield Road Brockley, S.E.

MINERVA, 2¾ h.p., Eadie frame, Palmers, Longuemare, Price's stand, first-class condition; £8 lowest.—V. Garrett, 57, Crystal Palace Road, Dulwich, S.E.

1 h.p. Lightweight, good serviceable machine, in excellent running order; £5 10s.; seen and tested after 8.30 p.m.—F.B., 53, College Street, Islington, N.

3¼ h.p. Rex, thorough condition, tyres perfect. Rich's back tube, tools and spares; owner purchased car; price £15, cost £50.—Clewer Court, Windsor.

EPR

Accumulators

should be specified when ordering your new 1908 mount.

They contain all the latest improvements in storage battery construction. Our new list will tell you why "E.P.R." cells are now so generally used. It will also save your money. A post card will bring you a copy by next post.

¶ What about your present accumulator? Why discard it and throw away money? Better send it up to us, and we will make it as good as new for about half of the cost of a new cell. We could send you letters received from clients all over the country, expressing absolute confidence and great satisfaction with the way we have dealt with their repairs.

¶ AGAIN. What about your present accumulator? Not worth repairing? Well, again we say, don't discard it. We take old cells in part payment for new "E.P.R." guaranteed accumulators. ONLY, please note this, our prices are fixed as low as can be consistent with good material and first-class workmanship. WE DO NOT CHARGE YOU A HIGH price for a new accumulator, and then allow you an inflated price for your old cell. Our prices are low, and the allowances we make for old cells are actual market value.

¶ We have specialised in accumulators since 1902, so you get the benefit of our experience.

P.S. DON'T forget to post that card to night.
